This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

+ *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.

+ *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.

+ *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.

+ *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at `http://books.google.com/`

The Nation.

NEW YORK, THURSDAY, JULY 5, 1900.

The Week.

The preliminary developments at Kansas City do but emphasize two elements in the Democratic situation which were clear enough before—that Bryan has a hold upon the organization which is more powerful than any other leader has wielded in many years, and that the party has been left almost entirely without conservative influences. In 1896 there were men of great prominence and weight in various States who were ready to fight the free-coinage heresy with the utmost vigor. Now there are delegates to the Convention who think that it would be "good politics" to keep silver in the background in order to attract votes, but not one who opposes the policy as a matter of principle. Indeed, there has never been a national gathering of either of the two great parties which contained so few of the leaders who had won its great victories in the past by commending it to the sober judgment of the country. There are whole delegations which contain nobody who was prominent or influential before the upheaval of 1896. The considerations which ordinarily affect the action of national conventions, where radicalism encounters stout opposition from conservative influences, do not apply at Kansas City this week.

The etiquette of the Platt-Roosevelt breakfasts is again thrown into doubt and confusion. The boss has smilingly declined the Governor's invitation to resume the series of political love-feasts. He says: "I do not know of any important matter that should be discussed." But Col. Roosevelt is fairly bursting with important matters. He wants to know about his successor in the Governorship. He desires first-hand information respecting Platt's alleged scheme to so hedge about Gen. Greene with a hostile Executive Committee and other machine obstacles that he cannot take the Presidency of the County Committee, or, if he does, will be impotent. What so consonant with the frank, breezy manners of the gallant Colonel as to whisper with Platt again over the coffee-cups concerning all these affairs, and then come out pledged to secrecy? But the boss will no more of these breakfasts. They have ruined his political digestion. He has probably heard, too, of Roosevelt's boasting among his friends how he had been very firm and very fierce with the boss in these breakfast-table encounters, and had "used" him as an instrument for good government. Platt is now willing to let everybody see who was really being used. Having no further use himself for the Governor, the boss sends him word in true Shylock fashion, "I will not eat with you, drink with you, nor pray with you."

The unprecedented shuffling and recrimination about the Republican platform have had one laughable result; the party organs have been caught napping. The *Tribune*, for example, had on the Thursday following the Convention one of those noble panegyrics on the Philadelphia platform which the party hack knows so well how to write—though how he can do it without grinning we never could imagine. The platform was "straightforward," and set forth the "opinions" of the party on "all issues of broad national concern without timidity, but also without exaggeration," etc. We all know this kind of article; any man could write it in his sleep; it really might as well be kept stereotyped for service in successive years. As for the Philippine plank, the *Tribune* thought on June 21 that the platform had "wisely refrained from committing the party." But lo, the change after Grosvenor's revelation! Why, said the indignant *Tribune*, on June 24, "the platform, to everybody's astonishment, contains no word with reference to one of the most important questions on which the Republican party has been called upon to act." Yes, but how well the *Tribune* had concealed its own astonishment three days before! On Thursday the platform was "straightforward," "wise," everything that was proper and lofty and inspired; on Sunday it was "pettifogging," a failure to "face the issue squarely," and so on. The trials of organic journalism have seldom been more gratuitously exhibited.

Prohibition of the liquor traffic throughout the United States as a Governmental policy is about as absurd as a proposition that poverty should be abolished in all parts of the country by Federal statute, and that it would prove just about as effective is established by the experience of Maine, Kansas, and some other commonwealths which have tried the system. Nevertheless, a number of good people get together once every four years to nominate a candidate for President on this issue, and they succeed in arousing a good deal of enthusiasm in their assembly. The gathering of the party at Chicago last week manifested uncommon bitterness toward the occupant of the White House, and the platform goes to such lengths as to charge Mr. McKinley, Methodist brother of many delegates, with "having, by his conspicuous example as a wine-drinker at public banquets, and as a wine-serving host in the White House, done more to encourage the liquor business, to demoralize the temperance habits of the young men, and to bring Christian practices and requirements into disrepute than any other President this republic has had." There is more warrant for the severe condemnation of the Administration's nullification of the Anti-Canteen Law, and of the license which it has granted to liquor-selling in the Philippines. There is undoubtedly a strong feeling outside the ranks of the professional Prohibitionists regarding the attitude of our authorities toward the question. It is not a matter of an official's personal habits which in no way differentiate him from the ordinary practice of a President. The just ground for complaint is that an Executive who exercises all the power of a dictator under martial law, has permitted in Manila a policy which increases drunkenness, insanity, and crime. The indictment which must stand against Mr. McKinley is the one which was formulated by President Schurman of the first Philippine Commission, that under his authority "we introduced and established the saloon there, to corrupt the natives and to exhibit the vices of our race."

Dr. William Everett's Phi Beta Kappa oration at Harvard last week was not only inspiring in its high moral tone, but also unanswerable in its logic. His reasoning is so clear, and his statements so precise, as to make it hopeless to defend the base and selfish conception of patriotism which now passes current. He forces on those who insist that every citizen should stand by the Government of his country when it goes to war, the question, why? If the word "should" is used, does not that import moral obligation, and require us to say that we must give our support because it is right for us to do so? But if this is true, then the citizens of the country against whom we are fighting are also right in supporting their Government. We kill them because it is right, and they kill us for the same reason. Hence, if we succeed, we are overwhelming a righteous cause, and *vice versa*. This grotesque and primitive conception of morality is probably a survival of polytheism. When every nation believed it had its own tutelary divinity, it was, of course, impious for any citizen to recognize the authority of the tutelary deity of a hostile tribe. The false conception of patriotism with which we are encumbered may have been an ancestral virtue, but it is a disgrace to modern intelligence. If there is such a thing as a moral law, it transcends the bounds of countries and the color of human skins. The absurdity of maintaining that a number of moral standards might exist, led to the establishment of monotheism; but the atavistic conception of patriotism, which demands that the soldiers of two opposing armies should pray to the same God to help them annihilate one another, is enough to bring the very name of religion into contempt.

Peculiar force and timeliness attach to the appeal for "Consular-Service Reform" issued by the American Association of China. It was put forth at Shanghai on April 5, signed by missionaries and business men, and with unconscious prophecy it described the capital importance of having in China, in times of crisis, consuls of the highest character and competence. While not attacking the present force directly, it is easy to read between the lines the mortification which American residents in China feel at our consular representation there. Yet, as the appeal points out, foreigners in China are "especially dependent upon their consular representatives." This is because, under extra-territorial jurisdiction, their lives and property, with their commercial interests and other rights and privileges, are in the consul's hands. It is extremely important, therefore, that consuls should have had some legal training, know something of the rules of evidence, and of the laws which they are to administer. The Association's appeal clearly implies that our actual consuls have not such qualifications. It explicitly asserts that they know nothing of the language, and are in this respect at a "great disadvantage" as compared with British and other consuls. But proficiency in Chinese can be had only after years of study, and, as the American Association of China plaintively declares, "the frequent changes of our consular officers are peculiarly unfortunate." Thus we have the old Philippine lesson taught us over again—that army and navy are not the only means of protecting American interests abroad. A reformed consular service is as much needed as guns and flags; but McKinley has not lifted a finger to secure it, as is evident from his selections for the consulates in China.

Admiral Seymour's dispatch is the first official news we have had from the Chinese interior. While it leaves the central mystery at Pekin darker than ever, it throws a clear light on the extent and nature of the wild insurrection which prevails inland. On June 18, the Admiral says, Imperial troops joined the Boxers in attacking his slender column. This is the first indication that the Chinese Government, as such, had anything to do with the assaults upon the foreign troops, and, of course, it is by no means conclusive, as a section of the Imperial troops may have mutinied and joined the Boxers. These fanatics, with their characteristic contempt of death, appear to have done almost all the fighting, and to have been killed in heaps. Admiral Seymour certainly conducted both his advance and retreat with skill and gallantry. One ominous note in his dispatch is his discovery of immense stores of guns, arms, and ammunition of the latest pattern in the Chinese arsenal, which he seized. This confirms the report that the Chinese had been secretly importing vast quantities of rifles. Here is one sardonic aspect of the great increase in Chinese trade, of which we and other civilized nations have been boasting. The weapons we have sold China she now aims at us.

The strike at Chicago, which has been going on some eight months, has been virtually settled by an agreement between the bricklayers' union and the employers, which includes a further agreement to refer all other similar disputes hereafter to arbitration, with Judge Grosscup as umpire. This is in harmony with the English system of voluntary arbitration described in the last number of the Bulletin of the Bureau of Labor Statistics at Washington. It is not unlikely that this publication was the immediate cause of the settlement at Chicago. At all events, the settlement must be hailed with satisfaction in every industrial centre of the Union, and we feel sure that it will find imitators in many quarters where heretofore strikes and lockouts have caused enormous losses, and yielded nothing to either side that could not have been gained at the beginning as well as at the end of the struggle. It might as well be recognized now as later, that arbitration of some kind will be invoked by the State as a deliverance from intolerable evils like those which at this moment hold St. Louis in subjection. Unless the parties immediately concerned desire voluntary arbitration on the English plan, the community will give them compulsory arbitration on the New Zealand plan. It is needless to say that the former is the preferable system, since it is always in the control of the parties concerned, and can be modified by them from time to time as they are taught by experience.

In St. Louis the strike of the street-car men has reached the last stage, which is generally a very short one, where an attempt is made to boycott the cars after all the lines have resumed operation. The scheme to cut off the revenues of an offending corporation by persuading a sympathetic public to patronize other means of transportation, always starts off well, and for a few days it looks as though the company could be starved out. But the number of people who will long endure daily inconvenience to maintain a principle is not large, and it dwindles rapidly when even those who feel most strongly, reflect how hopeless is the enterprise in which they have engaged. So the men who at first found a boyish pleasure in riding on an uncomfortable seat in an express wagon, while an open car went past almost empty, last week concluded that they were behaving in a pretty silly way, and the vehicles which were hastily devoted to new uses and at first were packed, became the empty ones. In St. Louis, the men who struck have not only gained nothing, like those in Chicago, but they have also lost their places. Meanwhile immense damage has been done to property, the business of the city has been seriously disturbed, and a number of lives have been lost. Here, too, is a case where it seems as though civilization had failed of its duty.

The awful calamity which befell the North German Lloyd Steamship Company in Hoboken on Saturday is without parallel in its kind. A modern naval battle would scarcely involve so much destruction of life and property. Everybody exclaims that such an accident ought to be impossible, and nearly everybody has some advice to give in order to prevent future disasters of this kind. One suggestion is that our piers ought to be built of granite instead of timber, but evidently granite piers would not have prevented the burning of the cotton and other material on them or the communication of the fire to the ships alongside them. Rear-Admiral Melville, who witnessed the horrible affair, makes the wise suggestion that the port-holes in passenger ships ought to be large enough for the body of a man weighing 200 pounds to pass through, saying that if these ships had been thus port-holed, most of the lives of the imprisoned crew would have been saved. It is evident, also, that if the ships which were exposed to this fire had had sufficient steam on to move themselves, the fire might have been restricted to the piers, and there would have been less loss of life. But these giants were inert and helpless. They were fastened to the piers by their own weight, and could not be moved till tugboats could be signalled and brought to their aid. The event points to the peril daily undergone by those who frequent the long piers to welcome or bid good-by to their tourist friends.

There is a State in the Union which has in its Constitution to-day a section providing that no free negro or mulatto, who was not a resident when the Constitution was adopted, "shall ever come, reside, or be within this State"; and also prohibiting any negro or mulatto, except one who lived in the State when the Constitution was adopted, from holding any real estate, or making any contract, or maintaining any suit. This seems incredible, but it is not so remarkable as the fact that the people of the State have recently had an opportunity to expunge these discriminations from the Constitution, but have failed to improve it, so that the anachronism will be continued into the twentieth century. When the question of Oregon's admission to the Union was pending in 1857, the people were allowed to vote on the question whether slavery should be tolerated in the State, and it was decided in the negative, three to one; and also on the question whether the refusal of residence and other rights to the free negro or the mulatto should be fixed in the fundamental law, which was carried, 8,640 to 1,081. There it has remained ever since, with its further provision that the Legislative Assembly should provide by penal laws for the removal by public officers of all such persons, for their effectual exclusion from the State, and for the punishment of any one who should bring negroes or mulattoes into the State or employ or harbor them. Of course, when the Fourteenth Amendment to the Federal Constitution was adopted, after the civil war, declaring that no State should make or enforce any law abridging the privileges or immunities of citizens of the United States, all these clauses of the Oregon Constitution became null and void. A proposition to wipe them out was submitted to the people at the recent State election, but it did not carry.

It is satisfactory to learn that the New York Chamber of Commerce has decided to create a standing Committee on State and Municipal Taxation. Such a committee will have a good deal of influence, not only on public opinion, but also on the Legislature, and it is unnecessary to state that such influence is demanded by the situation. The reasons assigned for this action in the report of the Chamber of Commerce constitute a severe arraignment of the present system. Expenditures for State and local administration are rapidly increasing, the rates of taxation are higher, and new taxes are continually imposed. The enterprises of individuals and corporations are driven from the State by unwise levies made upon them. The incorporation of joint-stock enterprises is hampered. Property is taxed, and the evidences of debt on the same are also taxed. Corporations of similar character are unequally taxed. There is a heavy tax on inheritances, and the collection of the tax is subject to extraordinary expenses, often apparently for political purposes. The taxation of franchises of a public sort proceeds on lines which may or may not be essentially just, but are certainly new, and require to be studied. It is by no means sure that taxes are collected with reasonable certainty. The basis of assessments is not constant, and the purposes for which the Board of Equalization was established are inadequately served by it. When it is considered that the tax rate often approximates to the interest rate, the attention of the most thoughtless observer should be arrested.

China has, for the moment, snuffed out South Africa, but events there still have great importance for the British Empire. There can be no doubt that the stubborn resistance of the Boers, and their settling down into guerrilla warfare, have been a disappointment to the English Ministry. The unexpectedly prolonged hostilities have had the effect of putting an end to the project, favored by Mr. Chamberlain, of having a general election in July. An autumn dissolution is still thought probable, in spite of, or because of, Mr. Balfour's evasion of a specific question on the subject in the House of Commons the other day. That even the military difficulties in South Africa are as yet by no means solved, is made evident by the Government's decision to hold all the troops there for the present. It would have been convenient to draw men from Lord Roberts's force to send to China, but they cannot be spared. And behind all is the question of pacification and final settlement. Two Ministers of the Crown spoke last week—one, the Duke of Devonshire, in a conciliatory vein, praising the Dutch and predicting their quiet acquiescence in English rule; Mr. Chamberlain was more truculent, declaring that a party existed in England willing to throw away the "fruits" of the war. But neither Conservatives nor Liberals can devise a plan of settlement which will succeed unless it follow the lines laid down by John Bright in 1849. He said:

> "People tell me I want to abandon our colonies; but I say, Do you intend to hold your colonies by the sword, by armies and ships of war? That is not a permanent hold upon them. I want to retain them by their affections."

The reports from India concerning the termination of the drought are cheering, but they furnish no reason for relaxing our efforts to relieve the starving people. Rains are indispensable, but human beings cannot live on water, and it will be many months before a new supply of food can be raised. In order to raise crops, the ground must be tilled and seed must be sown. The cattle employed in tillage have to a great extent died of starvation, and the grain required for seed has been applied to the relief of present hunger. The letter addressed by Lord George Hamilton, the Indian Secretary, to our Ambassador, shows that the Indian Government recognizes its responsibilities to the fullest extent. The task, however, can only be performed, as he says, wholesale. Nearly 6,000,000 persons are, in one way or another, maintained by the Indian Government, which has a sufficient fund for the purpose, and could rely on the Imperial Government for assistance should its own resources be exhausted. But the very magnitude of the scale on which official relief is carried on, shows the urgent need of private benevolence. Many classes and many individuals are not reached, and cannot be reached, by Government officers. Funds subscribed by private charity are administered by agencies in which the non-official element predominates, and money so distributed does more good than the subventions of the Government. Lord George Hamilton assures the benevolent that what they give will neither be wasted, nor tend to diminish the official contributions. It will relieve cases of individual distress that would otherwise be unavoidably disregarded or unnoticed. The statements contained in this letter do not constitute an appeal by the Indian Government, but are a dignified explanation of the character of the crisis, and they will stimulate the charitable to renewed exertions.

The extent of the efforts of the Indian Government appears from the letter of Lady Curzon to the Famine Relief Committee of Chicago. The dearth is more widely extended than on any previous occasion, and while it is believed that the deaths will be fewer, far more persons are suffering. The amounts expended in direct relief by the Government are $26,000,000, in suspensions and remissions of land revenue $10,000,000, in advances for the purchase of seed and cattle, $6,000,000, and $5,000,000 in loans to the distressed States. The Relief Committee has, through various channels, disbursed $2,500,000. These figures cannot be read, in spite of their deplorable cause, without a certain exultation. They show a better side of government, and of humanity, than wars professing to be benevolent. It would seem that such disbursements must seriously modify the financial estimates of the Indian Government. For the year now ending, the revenue was estimated to exceed that of the previous year, and the surplus was to be greater. The land revenue was to be nearly $5,000,000 less, and that from salt nearly $1,000,000. On the other hand, the revenue from opium, from stamps, from excise, and from railroads and the post, was to be materially increased. The relief of famine was expected to absorb over $10,000,000, which was to be nearly met by reducing appropriations for military purposes from $80,000,000 to less than $72,000,000. If the expenditure has been so great as Lady Curzon supposes, there must certainly be a large deficit in the Indian Treasury, even in the improbable event that the revenue comes up to the estimates. The amount of the deficit, however, will be much smaller than the cost of most frontier wars.

THE PLATFORM THAT FAILED.

In Saturday's *Tribune* Senator Foraker testified that he was not present at the last two meetings of the sub-committee on platform at the Philadelphia Convention, and does not know what was done at those meetings. He has a clear recollection that the first draft of the platform which the committee considered had been prepared by Mr. Charles Emory Smith and others; that the first part was an extended eulogy of President McKinley and his achievements, and that it was followed by planks on the financial question, the merchant marine (subsidy question), and the authority of Congress over the Territories. There were four meetings of the sub-committee. Foraker attended the first and second. At the first one he says that Mr. Quigg objected to the recitation of President McKinley's achievements as being too long, and not in good form, but that no one raised objection to the other planks, either then or at the next meeting. As he (Foraker) was "unavoidably absent" from the two later meetings, he cannot say anything about the changes made subsequently. In other words, Foraker fails to sustain Gen. Grosvenor's charges against Quigg, and leaves the victory with the latter, as we supposed would be the outcome when the charges were first made. Foraker contributes one item regarding his own mental attitude towards the platform. He says that in view of the fight over the power of Congress to govern Porto Rico, he thought it highly appropriate to insert a plank approving the position taken by Congress, and was very much disappointed to learn that it had been omitted.

That aggrieved rhetorician, Postmaster-General Smith, has at last caused to be published the splendid "Original Draft," of his composing. We do not wonder he feels hurt at its rejection. Such a "hoight of foine language" was never before offered in vain to a committee. This one evidently had no sense for style. Budding Burkes in the freshman class have often had their purple patches scissored out by the professor of rhetoric, with similar cruelty; but they usually hug their griefs in private. Freshman Smith bewails his in public. He acts much as Seward would have done if he had run to the press with a full account of the way in which Lincoln had cut to pieces his eloquent, but most imprudent, dispatch to Adams in 1861. "Leave out," "drop all this," wrote Lincoln freely on the margin of the Secretary's original draft; but Seward left it all to the historian. He, however, was not an editor with the "news sense"; perhaps he was not as proud of his style as Mr. Smith evidently is.

There was, for example, at the very beginning, a passage which would have won applause in any boys' debating society. Mr. Smith wrote of the Republican party, in a stately rhetoric that the youngest reporter on the staff of his newspaper might have envied:

> "Always the distinctive party of liberty and progress, it fulfils historic fitness that its crucial delivery should go forth from the sacred place where the Declaration of Independence was signed, and where the Constitution was framed. Its birth, midway in freedom's century, brought the emancipation of four millions of bondmen; and in the zenith of its career and power, the close of that century is crowned by the liberation of ten millions of the human family from the yoke of oppression."

Yet a rude and unfeeling committee left that all out.

But worse was to come—we do not mean worse writing, but worse treatment of Smith. He had determined to show the President the value of having a grateful and ready writer in the Cabinet, and had prepared a true and frank statement of McKinley's greatness, which he submitted to his chief, confident that it would meet with the approval of that modest man, as Smith says it did. This was the plank, of which the committee and the Convention left but a splinter:

> "In all this eventful and matchless history of success at home and triumphs abroad, our masterful leader has been the true patriot and the upright statesman, who has walked untried paths and faced unforeseen responsibilities with serene wisdom and lofty courage and patient fortitude. Clear in vision, strong in judgment, and firm in action, he has directed our momentous policies in the true spirit of American institutions and with abiding faith in the American people. His universally recognized nobility of mind and heart has inspired the confidence and won the affection of his countrymen, and for the completion of his great and unfinished work we invoke the coöperation of all patriotic citizens, without distinction of party, in the reëlection of President William McKinley."

Now we know what Smith means when he says that the platform he drew was the one "McKinley wanted to stand on." Any candidate might well desire to run for the Presidency on the proposition that he was so wise, good, and great that "all patriotic citizens" ought to vote for him. The obtuse platform committee, however, balked at that "masterful leader" business. Perhaps they thought people would consider it a joke, as applied to McKinley. Anyhow, the play of their knife about this pet plank of the adulatory Smith was as fearful as that of the man whom Thackeray saw dining on a Mississippi steamboat. Yet Smith is not without comfort. He records the fact that the President "scanned" and "approved" the restrained description of himself. The "masterful leader" smiles; what are the frowns of one ignorant committee?

There were many other interesting points of divergence between the "original draft," with the stamp of Executive approval upon it, and the form adopted by the Convention. There was a beautiful tribute to the Administration's "diplomatic achievements, without parallel in our annals," but it all went out except the barest mention of the "open door" in China. "We welcome the people of Hawaii, Porto Rico, and the Philippines to the fellowship of our republican institutions," wrote the expansive Smith. Pshaw! said the committee; what you meant to say is this: "We approve the annexation of the Hawaiian Islands." So the butchery of a masterpiece went on.

The committee must, in fairness, be judged by the amount of gush and adulation which they resisted and rejected. No one thought the official platform any great affair; but at least it was not that fulsome and flaunting thing which was devised in the Kitchen Cabinet. And the committee, moreover, distinctly strengthened the party deliverances in one or two points where McKinley would have infected them with his own indecision. The final platform squarely said, "We renew our allegiance to the principle of the gold standard." The version that pleased McKinley was simply a vague recitation of the fact that "the pledge of the gold standard has been fulfilled, . . . and we again announce our opposition to the free and unlimited coinage of silver *except by international agreement*." How Bryan will grin when he discovers McKinley's attempt to "hedge" again on the silver question, and what use he will make of it in his speeches! Nor had the President's platform one word to say about civil-service reform, or the appointment of natives to office in Cuba, Porto Rico, Hawaii, and the Philippines. In both these respects the committee supplied at least a perfunctory expression where the President would have been suspiciously silent. All told, with such a mushy mess as the committee had ladled out to it from Washington, the wonder is that the final result was as little nauseating as it proved.

HOW TO DEAL WITH TRUSTS.

That the Trust issue is to be of some importance in the coming campaign there is no doubt. Nor is it doubtful that, if votes are to be gained by merely harping on the word Trust, the Democrats will make a net gain, notwithstanding that the Tammany leaders have been detected in a very odious Trust of their own. The fact remains that the Republicans are more identified in the public mind with capital and combinations of capital than the Democrats are. The Ice Trust is local, and its damaging political effect will be limited mainly to its sphere of operations, while the Trusts in general are coextensive with the country. It remains to be seen whether the outcry against them can be maintained effectively through a Presidential campaign, and whether it will yield any important results at the polls.

That there is a vast deal of demagogy in the declamation and legislation against Trusts, it is needless to repeat. Yet there are some features of these latter-day inventions that call for grave attention, and are now obtaining it at the hands of the best thinkers in the United States. In this category Prof. J. B. Clark of Columbia University must be classed. He has gained distinction in the field already by contributing to the literature of the subject a good definition of the word Trust, as it presents itself to the public eye. He says that a Trust is "any combination of capital large enough to be dangerous."

Professor Clark continues his examination of the phenomenon which goes by the name of Trust, in the June number of the *Political Science Quarterly*, and he deals with it in a very vigorous way. His article is not in the least recondite or hard to understand. Although he recognizes all the difficulties which legislation must encounter in seeking to regulate Trusts and to curtail the evils which attach to them, and are, perhaps, inherent in them, he points out remedies for some of them. He has a thorough contempt for buncombe. The spirit in which he enters upon his task is shown in the following introductory paragraph:

> "More general than the opinion that the Trusts ought to be crushed is the conviction that they will not down. They are here to stay, and we know it. An explanation of the light-hearted way in which we put upon the statute-books laws that aim to crush them, is found in the fact that such laws do their principal work before they are enacted, when they are nothing but planks in political platforms. In the present temper of the public mind severe measures are at least good for the party that promises them; and if, by an experiment or two, it is shown that they are not workable, there is the less danger in continuing to enact them into laws. In general, political platforms have of late required prohibitive statutes, with pains and penalties attached to them; and though such statutes have frequently been enacted, so far as large results are concerned, that has been the end of it."

The first remedy which Professor Clark proposes is publicity. In this he has been preceded by President Hadley, and the same remedy was suggested ten years ago by Abram S. Hewitt, in an address before the Institute of Mining Engineers, in which the reasons for publicity were expounded with great force and candor. "This principle," he said, "is already recognized and enforced with reference to savings and other banks, insurance and trust companies, and railway corporations. It has not yet been applied to industrial organizations, but these now exist on so large a scale and employ so many men, disputes with whom affect the public convenience and interests so seriously, that every safeguard should be applied to prevent the disturbance and dislocation of industry. Publicity as to profits and losses would at once remove the most serious cause of strikes," etc. The power of the press and of enlightened public opinion, Mr. Hewitt believed, would do away with most of the evils complained of, if all the facts regarding the operations of Trusts and combinations of capital were at all times accessible.

Professor Clark shows what is meant by publicity, and why the light should be turned on the Trusts. In the first place, there is nothing that the Trusts dread so much as public knowledge of their business. May we not say, then, that whatever weakens our enemy strengthens us? While we require a railroad company to publish all of its doings down to the minutest fraction, we require no publicity at all concerning those of a Trust. Yet a Trust is composed of a body of two classes, *i. e.*, stockholders and officers, whose interests are by no means identical. The officers may transact the business in a way to make money for themselves at the expense of the stockholders, as well as of the consumers of their goods. There have been instances where the officers were strongly suspected of sacrificing their stockholders by "selling short," and then frightening the latter and forcing their shares on the market. In the interest of the shareholders, therefore, the law may rightfully require publicity.

How, it may be asked, will this help the public? The public will then know, says Professor Clark, "what plants they own, what they gave for them, what they are worth at present, for how much they can be duplicated, what appliances they contain, whether antiquated or modern—in short, what is the substantial basis for the value of stocks and bonds that are placed on the market." When all the facts of the business are made public, then if the Trusts charge too much for their products, competition will be excited, new mills will be built, and prices will come down. We understand that in some Trusts not even the directors are allowed to know the "bottom facts"; only the managing officers are admitted to such knowledge. The first step in the way of reform must be the uncovering of facts connected with the business.

The next step which Professor Clark advises is to abolish customs duties on all articles manufactured by Trusts. It is true that Trusts exist in free-trade countries, but their power for harm is very slight, and their powers here would be much curtailed if this remedy were applied. Professor Clark is not, however, in favor of a general attack on the tariff system, and he sees difficulties in the way of this remedy arising from the solidarity of the tariff interests. He considers the question whether it is possible to regulate by law the prices of goods made by Trusts, and thinks that this cannot be done. He asks also whether the State may enter the field as a manufacturer, either to compete with the Trusts or to take their place, and decides that this plan "must stand or fall with the general cause of socialism." He has no confidence in that remedy.

There is one other means of curbing the Trusts, and that is to open the door to competition with them where they have closed it or sought to close it. Professor Clark would have laws to prevent and punish what are called "factors' agreements," which are in reality boycotts, by which dealers in their goods are required to buy exclusively from them, they giving certain advantages in return. They should be compelled also to sell to all persons and to all sections of the country at the same price. It is their practice, upon occasion, to crush competitors in one place by lowering their prices there, while keeping them up or even raising them in all other places. This they are enabled to do by their enormous capital and their greater command of the market. Professor Clark thinks that this is one of the most crying evils of the Trust problem, and that it is a remediable one. At all events he would attack it by all the powers of the State.

THE JUDICIAL FUNCTIONS OF THE GOVERNOR.

In his speech at the Republican Convention in Philadelphia, Gov. Roosevelt declared that the foremost leaders of the Democratic party in this State had been discovered in a Trust which was really of infamous, and perhaps of criminal character; a Trust in which they sought to wring fortunes from the dire need of their poorer brethren. At the time when these statements were made, charges were pending against one of these leaders, the Mayor of New York, because of his interest in this Trust, upon which it was in the power of the Governor to remove him from office. Charges were also pending against the Comptroller of the city, a man whom the Governor had openly recognized as his most formidable competitor, and whom he can also remove from office. The same power exists in the case of the District Attorney, against whom also charges are now pressed. As to the merits of the charges against the Comptroller and the District Attorney, the Governor, so far as we are informed, has expressed no opinion. But as to the case of the Mayor, Gov. Roosevelt's declarations at Philadelphia show that he has prejudged it. It is unnecessary to prove that the Ice Company is of a criminal character in order to enable the Governor to act. His power of removal, after a hearing, is unqualified, and he can hardly justify a refusal to remove an officer whom he declares to be guilty of infamous extortion.

One of our best constitutional traditions is the supreme importance of separating the executive from the judicial functions of government. In spite of the modern contempt for the limitations of "outworn" constitutions, we cannot admit that the reasons for this separation of functions, so clearly stated in the 'Federalist,' have lost any of their force. On the contrary, they are of greater importance than ever before, and the recent protest against the nomination of Mr. Hazel for the office of Judge of a United States Court shows the strength of the feeling, not only of the bar, but also of the more intelligent part of the community, upon this matter. For what was involved in that case was really the independence and impartiality of the judiciary. Mr. Hazel was known, and known only, as a "politician"; an active partisan, having much influence with the Republican Administration. It was felt that in cases where the interests of influential Republicans were concerned, even if no party considerations were directly involved, Mr. Hazel would be disqualified for judicial functions. Even with the best intentions, he could not suddenly change his point of view, and consider the controversies submitted to him solely in the dry light of legal precedent. No ardent partisan, in short, is fitted to be a judge, for nowadays "politics" crops out in numberless controversies.

It will hardly be disputed that in removing an elected officer the Governor exercises a judicial function. Although his power is absolute, it is called forth by the presentation of charges, and the Constitution at least implies that the Governor shall decide according to the evidence submitted for and against these charges. Were a judge to express himself publicly concerning the merits of a case which was to come before him, as Gov. Roosevelt has expressed himself concerning the participation of the Democratic leaders in the ice monopoly, it would be thought highly indecorous. It would be said that he had made up his mind that the defendant was guilty before he had heard both sides, and that his decision could not be unbiassed. Were the judge known to be a violent partisan, who held his adversaries in supreme contempt, when he came to sit in judgment on them, with no law to restrain him and no higher court to overrule him, his decision against them would have no moral weight. We apprehend that much the same will be true if Gov. Roosevelt removes Mayor Van Wyck. We have no desire to justify that functionary, whom the city would be well rid of; but he would certainly pose as the victim of political persecution, and he would probably appeal for sympathy with a good deal of success. In fact, it would probably be "bad politics" for the Governor to remove him now, simply because it would be said that the power of the Executive was employed for partisan ends.

No doubt a Governor of greater wisdom than the present incumbent possesses would not have pronounced judgment in advance of trial; but the question is not a personal one. The power of removal on charges must be recognized as essentially judicial, and regulated according to judicial requirements. From time immemorial the Executive has been empowered to remove sheriffs and mayors, but the power has been exercised very seldom, and perhaps never except in cases where the misconduct was so gross as to be undefended. The development of our party system was never dreamed of when this power was conferred, nor was it imagined that any mayor would direct the affairs of a city of 3,500,000 inhabitants. Now, the Governor of New York has become the representative of one political party; and the Mayor of New York city may be the leader of the other. To ignore these changes is no longer safe; for it is absurd to suppose that the practice of resorting to the Governor to remove city officers will not grow, now that its political advantages are understood. Of course, some way of removing our mayors must be provided; such a thing has never been done, but we should be shocked at the possibility that it could not be done. The proceeding, however, has now become so serious a matter as to require to be conducted judicially, and the Executive may properly demand to be relieved from such functions. At present any newspaper or any individual may drag the Mayor or the Comptroller before the Governor by making charges, and the Governor may be placed in a very embarrassing position. In penal statutes it is not enough to speak of "charges," or of "high crimes and misdemeanors." It is practicable to define the offences for which removal from office should be the punishment, and to provide for the proof of guilt by judicial methods. When the charter is revised, this matter should be attended to, for if it is not, we shall be in danger of serious conflicts in the future.

The editors [illegible]

CHINA AND IMPERIALISM.

The situation in China at the present time renders it possible to draw a clear distinction between the traditional American policy in cases where our citizens are put in peril while residing abroad, and the policy of Imperialism. The former would simply afford protection when it is demanded. The latter would improve any opportunity to seize territory of another country which might be afforded by the sending of troops within its limits, ostensibly for the simple purpose of saving the lives of citizens. The course of the United States hitherto, in all cases resembling the crisis in China now, has been consistent; there has been no attempt to utilize the chance advantage of a temporary lodgment to secure a permanent foothold. On the other hand, the Powers of Europe have repeatedly retained possession of territory by reason of the fact that their troops occupied it because of what was originally represented to be a mere exigency, certain soon to pass by.

When news came from China that American citizens and officials of the United States were in the greatest danger, it was the plain duty of the Administration at Washington to take immediate and effective measures for their protection. There was not an hour to lose, and the cost of the measures necessary was not to be considered. Inaction on the part of the Executive would have been a criminal breach of duty. Hair-splitting over the question whether the dispatch of troops would mean a state of war, and delaying to call Congress in special session a month later for consideration of that question would have been resented as the evasion of a plain and imperative obligation.

There can be no question that the nation supports the Administration in the prompt, efficient, and discreet action which it took when the emergency arose. It will continue this support so long as the policy pursued is consistent with these preliminary steps, and it appears that American fleets and troops are in China simply for the rescue of American citizens, and the assurance of their protection after the existing disturbances shall have been quelled. Just so long, moreover, shall we continue to enjoy the confidence of those Chinese who are familiar with our past history. A striking proof of this confidence is afforded in the dispatch from the Canton correspondent of the London *Telegraph*, who says:

> "Li Hung Chang trusts the Americans in this crisis, saying that they alone do not want territory, and he places himself almost without reserve in their hands. At an important conference on Monday, he reiterated that sentiment, and added that he was determined at all hazards to secure the best results for China and for the maintenance of the most friendly relations with the United States and other foreign Powers."

Li Hung Chang is entirely right in his belief that "the Americans do not want territory," so far as the people of this country are generally concerned. But there are undoubtedly interests in the United States which believe that it would be to their advantage, in case any proposition should be made by European Powers for a division of the Chinese Empire, that this nation should get its slice along with the rest. The strongest argument with these interests for the retention of the Philippines all along has been the claim that a vast deal of money was to be made by exploiting the islands.

There will be plenty of politicians quick to support such a movement in case it should be pressed. Already we find Republican Congressmen ready to break ground in favor of our seizing Chinese territory if we shall have a chance. Representative Bromwell of McKinley's own State, who is now serving his fourth term as member for the Cincinnati district, and who has been regarded as a conservative man, is quoted as talking in this strain on the subject:

> "If the Chinese Empire has to be divided, I am most certainly in favor of getting the proportion of territory that belongs to this country. The fact that we have the Phil-

> ippines will not insure us full commercial advantages if China goes into the hands of Europe. You may be sure that those countries are not risking anything to get some Chinese territory for the fun of the thing. It is commerce and trade they are after, and we cannot afford to be a minute behind in the same course, except that ours can be done under restrictions, and in keeping with our policy of going alone and independent of other nations."

When such a deliverance as this comes from a Congressman who is not considered a Jingo, it is evidently time for public opinion to express itself. The Administration should be left in no doubt as to the feeling of the people. The policy which Representative Bromwell advocates is rank Imperialism. It goes far beyond anything that has been done or recommended in the Philippines. The excuse for our staying there has been that we are forced to stay in order to discharge the obligations imposed by the treaty of peace with Spain. Here is the bald proposal to seize Chinese territory for no other purpose and with no other defence than to promote our commerce and trade. It will disgrace the American republic if what everybody in the world can recognize as out-and-out Imperialism, shall be adopted as tne policy of our Government in China. The Administration should be protected from all temptation in this matter by the prompt notification of the people, through all the recognized organs of public opinion, that they would never support such a policy.

LOCAL GOVERNMENT IN IRELAND.

DUBLIN, June 4, 1900.

The Local Government Act of 1898, replacing the non-elective governing bodies by local councils for which every householder, man or woman, had a vote, has now been in operation for a year and a half. The underlying principle of the scheme, that every ratepayer should be an elector for those bodies which spend the rates, is one to which no valid objection could be made; and none was made except by the small minority, mainly landowners, who had heretofore raised and spent the local rates without any responsibility to those who paid them. Their opposition was bought off by exempting them from all local rates on their rental. A landlord now pays rates only on the land he actually occupies, and, if be is an absentee, may draw a rental of ten or twenty thousand pounds a year from bis property without contributing to the local expenditure on roads, drainage, water supply, poor relief, etc., which are necessary to the maintenance of the value of his estate.

It is difficult to convey any idea of the appalling complexity of the Local Government Act. That is a special characteristic of all English legislation for Ireland. What is conceded in the way of reform is controlled, checked, and often taken away by qualifying and modifying sections. The Local Government Act contains about 50,000 words; but this is only a small fraction of the law, for the Act provides that a vast number of subjects are to be dealt with by orders of the Lord Lieutenant and the Local Government Board; and a mass of orders and rules, ten times more voluminous than the principal act, have been issued. Then no less than fifty-six English, Irish, and Scotch Acts of Parliament are incorporated wholly or "so far as they are capable of being applied." Sixteen Acts are wholly repealed, but there are eighty-six Acts of which sections, parts, and in some cases words only are repealed. All these must be read with the Local Government Act of 1898. Thus, the new Act, apart from some few principal provisions, is rather an index to 152 other Acts, and to an immense volume of orders and rules, than a law in itself. The obscurities and meanings of all these directly enacted, incorporated, and referred to provisions can be cleared up and explained only by judicial decisions; and a body of "case law" is already emerging from the many suits that have arisen. The interests of the poorest classes about the simplest matters are still in doubt. For instance, the liability of weekly tenants to pay yearly rates will either impose a new and unexpected burden on the many poor who rent cottages by the week, or occasion a loss to the rate-collecting body; for the person supposed to be liable may be here to-day and gone to-morrow. The attempt to levy rates for the year from persons who have hitherto paid them in their rent, week by week, has already raised local storms.

The local governing bodies now are County Councils, Borough Councils, Urban and Rural District Councils. For certain general purposes, such as main roads, public buildings, and general sanitary works, the County Councils can tax or obtain contributions from the included areas, and great difficulty has been found in ascertaining what the proper contributions are from the smaller areas. The Local Government Board, consisting of the Chief Secretary, the Under-Secretary, and four Commissioners in Dublin, is supreme over all the councils. It supervises, controls, directs, advises, and can enforce obedience on almost every question. Its members are appointed by the Lord Lieutenant; it is in no sense representative, and is on most questions opposed to popular feeling. It has unlimited powers of interference, subject only to the possibility of a refractory council appealing to the law courts. It approves or disallows the appointment of all employees of the local councils, claims the right to settle what salary each officer shall be paid, and the terms and tenure of his office. Some central control of the local councils is desirable, and rigid supervision is necessary to secure uniformity of administration, accuracy of accounts, and financial purity; but the interference of the Board goes far beyond general measures to secure these, and is already arousing the hostility of councils and ratepayers throughout the country. Extravagance was the main fault debited in advance by prophets of evil to the new councils; but the reverse proves to be the case. The councils, knowing the local circumstances, engage competent surveyors, secretaries, medical officers at what they deem sufficient salaries, which those officers are willing to accept; but the Central Board requires in one case that the surveyor's salary shall be £800 instead of £600, in another £550 instead of £500; that the road overseers in one county engaged at £100 a year shall be paid £150, and so on through all grades from chaplains to midwives. As a rule, the local councils are Catholic as well as representative; the Central Board is Protestant, unrepresentative, and unacquainted with local circumstances and requirements. It is supposed that Protestant officials use undue and secret influence with the Board for their private advantage. Such interference with the salaries and tenure of the officials of the local councils has aroused a mutinous spirit among them. They are inclined to set their employers and paymasters at defiance, trusting to the Central Board to support them. A medical officer obtained two weeks' leave of absence, his council undertaking to pay a substitute for that time. The Central Board decided he should have three weeks' leave, and that his substitute should be paid for that time; but on the case coming before the Court of Queen's Bench for recovery of the third week's pay, the judges decided in favor of the local council, condemning in the plainest terms the unwarrantable interference of the Central Board. It is only in rare cases that disputes between the councils and the Board can come before the courts, but already the Board has had some bad falls for illegal and unwarrantable interference. The tendency of unrepresentative bodies is to be overbearing and tyrannical. More friendly suggestion, guidance, and helpfulness, less censorship, control, and restraint are needed from the Central Board.

The best effects of the new Act are to be seen in the relations between the local councils and their constituents, the ratepayers. Notwithstanding the grant in aid of the local rates from the national exchequer, rates have risen, partly owing to the complexity of the Act and its administration; partly owing to increased salaries and liberal retiring pensions ordered by the Central Board, and partly owing to the increased requirements of the ratepayers. I live in a small urban district with a population of 3,000, managed by a council of twelve members. For thirty years before 1898 there had hardly ever been an election. There was a high property franchise, and the local Board usually coopted its own members. Now there is an election every year of three members, that number retiring by rotation every year, but being capable of reëlection. The old Board was practically a family party; its characteristic was unapproachableness. A ratepayer who was not on terms socially with the Board could hardly get attention or even a civil answer to a complaint. The sanitation of the poorer parts was as bad as could be. The new Board are, above all things, civil—any and every ratepayer will at least be listened to; the proceedings are carried on in public; we know what is going on, and who are the active and responsible members. In the space of a year the roads in the district have been properly kept—not, as in old days, only those which led to the houses of the Board. Many long-complained-of nuisances have been abated; the water supply and public lighting have been extended to neglected parts of the district, and the Council have built twenty good laborers' cottages to replace insanitary cabins. In fact, though much remains to be done, the district has been improved, and every ratepayer takes an intelligent interest in what is being done. Many things cannot be done because, for every public improvement which would involve the taking of land or rights over land compulsorily, it would be necessary to get the assent of Parliament at Westminster at a cost which might amount to a year's income of the district. It was the intention of the Act that all rates should be collected by one body, the local council contributing its proportion to other bodies for common purposes. As the Act, hurried like all Irish measures, and much of it passed after midnight by means of the closure, turned out, this intention was not carried out. I still have to pay three different rate-collectors and to pay for their office expenses and salaries. Rates have risen and are likely to be still higher, though there is room for much economy in collection and administration.

On the whole, the Local Government Act is an improvement, but one cannot but see how much better and simpler a measure would have been passed if it had been framed by Irishmen in Dublin and discussed there under daily local criticism, instead of being forced through Parliament in Westminster by the votes of a majority who knew nothing of Ireland, who cared nothing about the details of the measure, and who were under no sense whatever of responsibility to the persons affected by its operation.

A comparison of the Local Government Boards in England and Ireland illustrates one of the chief vices of the English government of Ireland. The central Board in England costs that country £197,000 a year, or about £6 per 1,000 inhabitants. It is managed by a President, a member of the Cabinet paid £2,000 a year, assisted by a Parliamentary and a permanent Secretary, whose salaries amount to £2,800. The Central Board in Ireland costs £140,000 a year, or £31 per 1,000 inhabitants. The President is the Chief Secretary, with no special salary for this office, and nominally the head of many other boards and general administrator of Ireland. The Under-Secretary for Ireland is an ex-officio member; the Vice-President receives £2,000 a year, the same salary as the English President. His duties are shared by three Commissioners receiving between them £3,600 a year, and this Board of six members is assisted by a suitable staff of secretaries and clerks. England has always been very generous in spending Irish taxes. Eighty years ago Sydney Smith said: "Our establishments are so enormous, and so utterly disproportioned to our population, that every second or third man you meet in society gains something from the public." No change has been made in that respect; it is one of the established methods of preserving "loyalty" in Ireland. Here we have a Board of six highly paid officials, out of harmony with public opinion, to do what would be much better done, and is better done at a fifth of the cost in England, by one man who represents and is responsible to the public for his administrative acts and policy. AN IRISHMAN.

THE PARIS EXPOSITION.—II.

FRENCH FINE-ARTS SECTION.—I.

PARIS, June, 1900.

Any one whose special interest at the Paris Exhibition is in the Fine-Arts Section must, I think, pass, as I did, through an interval of bewilderment and discouragement. The things one has come to see are everywhere. Statues line certain of the avenues and alleys, and form an essential element in the architectural scheme; paintings and mosaics and gesso adorn the façades of building after building, and, in many cases, the names of the artists figure in the catalogues as if their work were part of the collection in the galleries. Nor can you enter a building, from the Salle des Fêtes or any of the foreign pavilions, to the gayest little theatre in the grounds, without finding pictures or mural decorations of more or less importance. Finally, there are the two huge palaces devoted solely to art. There is more, really, than could be comfortably seen in a lifetime.

It was for this reason that, as a result of my first bewilderment, I determined to devote myself and my time chiefly to the art of the century. I do not mean that I did not go to the Petit Palais des Beaux-Arts and enjoy the marvellous Retrospective Exhibitions arranged by M. Molinier and M. Marcou. The interior of the building is still more successful than the exterior; the galleries are large and spacious; the decoration is simple, and it is only on looking into the central court that the eye is confused and wearied by the endless ornament, elsewhere the rule. And there is no overcrowding of exhibits. It seemed to me the most restful retreat in the Exposition—and, moreover, a retreat filled with beautiful things. The art of France from the earliest ages is represented. There are ivories, bronzes, and enamels; tapestries, armor, and embroideries; furniture, wood-carvings, and a few pictures, admirably arranged; and I have brought away with me an impression of rich stuffs and gorgeous color that I cannot quickly forget, and would not, if I could. But, after all, while many of the examples shown are of unusual interest, all these different arts and the periods they cover can be studied in other galleries, and I believe a permanent collection of the same kind is to find a place in the Petit Palais after the Exposition is over. On the other hand, the chances are that never again will there be such a complete display of the painting, sculpture, and engraving of the century as that which is now made in the Grand Palais, and, here and there, overflows into the gardens and smaller halls and pavilions.

This Palace consists of two long lateral wings, connected by two lines of galleries, the whole, in form, not unlike the letter H. You enter from the Avenue Nicolas II. into an oblong court, which, at the first glance, is so small in proportion to the façade that it becomes oppressive. A long hall leads from it to the charming circular court of the smaller wing which faces the Avenue d'Antin. In these two courts and the galleries enclosing them are three distinct collections: first, the Centennial, consisting of French paintings and sculpture, drawings and prints, from the beginning of the century down to the last International Exposition; the effort having been successfully made not to repeat the exhibits of 1889. And with this series a little furniture is shown—the first time furniture has been thus introduced. Second, the Decennial, composed of the work of French artists during the past ten years; and, third, the Foreign, which includes the productions during the same period of artists of all other countries.

There is no question that in France most of the great art movements of the century have originated. I do not belittle the part played by Bonington and Constable in its early years; I will even admit that Byron and Scott "made Romanticism in France." But it was only in that country that their influence became a vital factor, destined to move the whole world of art and literature. A centennial collection of French pictures is, therefore, an indispensable introduction to the study of contemporary schools and tendencies. Of course, there are the modern series in the Louvre and the Luxembourg, and scattered through French provincial museums. But in the Louvre serious gaps occur, and I know of no gallery so ill arranged as that to which you must go to study Ingres and Delacroix, Corot, and the men of Barbizon, while, to come down to living artists, the journey must be taken across the Seine to the Luxembourg. But here, in one long succession of pleasant, well-hung, and not over-decorated galleries, you pass from the dull and decorous conventions of the First Empire to the gallant crusade of the Restoration, from the fierce fight for independence of the seventies to the calm of to-day that threatens the inauguration of a new era of dull and decorous conventionalism. There is no period more interesting in the history of art in France—no period more romantic in the history of art in any country.

The first two or three rooms of the Centennial Collection are sufficient to justify the Romantic rebellion against the Classic, or, for that matter, to account for any excess or orgy of independence. Were it not for the importance of the work historically and the personal distinction of some of the painters, you would not have the patience to linger in these galleries. Greuze did not die until the century was five years old, but his pictures, as you see them here, cannot detain you with pleasure. His sentiment, at his best, is overdone; at anything less than his best, it is unbearable. Prudhon, an Independent before the time was ripe for independence, and a few others of minor note, share the first gallery with him. But Prudhon, though here and there a portrait by him is full of character—none so much so, however, as an almost Hals-like old woman by the now wholly forgotten Guiard—always seems to me to fall just short of the charm that ought, by rights, to be found in him. And after Prudhon come the painters who were looked upon as giants by their contemporaries, and with whom it is impossible for us to sympathize: David and the men so influenced by him—Gros, Gérard, Girodet, Guérin—that they either never dared to develop whatever originality was in them, or else, as with Gros, were quick to suppress it in obedience to orders. Their pictures are without depth, without atmosphere or light; the color—but there is no color; they are dull, murky, brown, dirty; not time itself can mellow them. They excite an interest, made up partly of wonder that they ever passed for masterpieces, partly for delight in their historical associations, and just a little for irritation because, being so capable, they are nothing more. For the pictures are capable, and the painters were accomplished after their fashion. There is one portrait here by David, of a young man, over whose striking face a high felt hat throws a strong shadow, that has something of the quality of an old master, and makes you resent the more the rigid classic convention to which he sacrificed all that was finest in him. But this portrait is an exception, and though you cannot help stopping before the sketch by Gros for the "Combat de Nazareth" (the picture never finished because Napoleon probably objected to the glorification of Junot), or before the large equestrian portrait of Napoleon himself after the battle of Marengo, from Compiègne, or the other Napoleonic records, there is scarcely a canvas that appeals to you as a picture. And it is curious, too, to note that, while it is the habit to praise the classic group for at least their technical knowledge and skill, the big *machines* of David and Gros—the huge "Distribution des Aigles," from Versailles, or the "Embarquement de Madame d'Angoulême," from Bordeaux—simply prove how much better that sort of thing is done by the still more skilful painters of to-day.

Into the midst of these emotionless classical exercises, Géricault breaks with a passion that is irresistible. There are only a few of his paintings—the sketch for the famous "Radeau de la *Méduse,*" another for a Race, a third for a portrait of a chasseur, a little "Trompette" and "Cheval arrêté par des Esclaves"—and these few are not over well hung. But they arrest you at once. They are as full of life and vitality as those that preceded them are inanimate. They have the very qualities the Classicists despise, depth, atmosphere, color; above all, emotion. Here, at last, you realize, is a man who has seen things for himself, and who has cared too much for the way he has seen them to adapt his method of expression to the cut-and-dried principles of any school. I think you must discover Géricault in such company to recognize the force of his genius, to understand why the "Radeau de la *Méduse,*" in the Salon of 1812, has been considered the first Proclamation of Romanticism. The advantage of an exhibition of this kind is that it not only shows you pictures you have hitherto known by reputation only, but shows them in their proper relation to contemporary work, which makes all the difference. I fancy to many people, as to me, Géricault in his present surroundings will come as a revelation.

Had Géricault lived, there is no doubt that he must have towered head and shoulders above the men of his generation whose names are now more widely honored. To be honest, there is a glamour about the Romantic movement, the gallant rebellion of *les Jeunes* of 1830, that blinds us to its true proportions. We borrow, despite ourselves, the enthusiasm, the flamboyancy, the exaggeration of the young men themselves—the most amusing, self-conscious, posing young men, surely, who ever lived. We, too, march under the banner of the Red Waistcoat, won over by the headlong eloquence of the critics of the day to whom Eugène Devéria—the man of one picture—was the modern Veronese, and Delaroche a cross between Van Dyck and Rembrandt, and Léopold Robert another Raphael! The drawback to Romanticism, Heine wrote of the Salon of 1831, was that every man was striving too hard to develop his own personality. But when it comes to facts, when you refuse to be blinded by the glamour, what a very poor thing that personality seems to have been in most cases! As you see their work in the Exposition, you are amazed at the commonplace—the characterless commonplace—of the Devérias, the Célestin-Nanteuils, the Roqueplans, the men of forgotten reputation, whose names, Heine thought, deserve the most distinguished consideration. The conditions were much the same then as now. It was natural, no doubt, that each young man who rebelled against the David tradition, looked upon himself as a genius, and was so honored by his friends. But the majority, then as now, were painters of mediocre talent; only one or two were artists of distinction.

In the period that immediately followed David, the two great names are Ingres and Delacroix. It requires another effort of honesty to admit that both, here, are in a measure a disappointment. Ingres was the perfect draughtsman, but his painting—even the renowned "Source" of the Louvre—has always left me cold and indifferent. Nor do I think there is anything in the Exposition as fine as the "Italian Lady," also in the Louvre. A partly effaced fresco by an artist unknown, on the wall opposite, has more character and life and sincerity than the whole array of his portraits, and, to me at all events, the two little versions of the "Francesca di Rimini" are marred by every sentimental fault of the age. The single picture in which I could take pleasure was the "Entry of Charles V. into Paris," a small canvas, in which he is more primitive than the Primitives, far surpassing the more deliberate efforts of later Pre-Raphaelites. To see Ingres as the master, as the great artist he is, you must go up stairs to the gallery of drawings, where there is a wonderful series of his portraits in pencil lent by M. Bonnat. It savors almost of heresy to bracket Ingres with Delacroix, for no two painters could have been more opposed in ideals and methods. But they are alike at the Exposition in the disappointment they have in store for the student. The trouble with Delacroix is that we know too much about him, and expect too much. We have read his journal and his letters, we have read the criticism of men who admired him with the intensity of Baudelaire, and before his pictures we can never forget the greatness of his intellect, the nobility of his ambition, the independence of his standpoint. But, I asked myself as I stood in the gallery where as many as sixteen of his canvases are hanging, had I chanced upon them unawares, would the color have struck me as very much richer and more beautiful than the color of the Classicists; would his personality have appeared so defiant; would his intellectual powers have proved so staggering, his emotions so stirring? I am afraid not. His larger pictures here, the "St. Sebastian" from the church at Nantua, the "Grèce expirante sur les Ruines de Missolonghi," are formal, almost academic. It is only in an occasional little sketch that a sudden splendor of color or the rhythmical expression of movement stirs you with an appreciation of what Delacroix wanted to do, but so seldom achieved, because, probably, of the intellectual qualities for which we admire him. I found myself turning from his work with relief to two sombre, stately landscapes by Decamps in the same room—landscapes, one empty save for the glory of the afterglow, one with a line of dark mysterious figures against a low rift of gold in a clouded sky, that seem to breathe the very spirit of Romanticism, to be filled with the beauty and mystery that just eluded the grasp of Delacroix. I found myself thinking that there was far more honest emotion in "Le Port de Dieppe" by Isabey; that even Chassériau could be, at times, as effective.

Really, after Géricault, the first man to arrest you in the midst of the Horace Vernets, and the Scheffers, and the Lamis, to overwhelm you with his originality, is Daumier, better and more widely known as lithographer and caricaturist than as painter. Now and then I have come across his pictures in the smaller London galleries that make a point of exhibiting nothing but the work of the masters, but never have I seen so many collected together. There are eighteen, and they are well chosen; characteristic studies of the lawyers he so often caricatured in black-and-white, strolling players as romantic and picturesque as Gautier's, the popular types he loved, Don Quixote, the hero of whom he never tired, the Republic, symbolized as a statuesque figure that explains why his friends compared him to Michelangelo—altogether a marvellous array. No painter of the day was so genuinely a Romanticist in his attitude. To the larger number of the ambitious youths of 1830, revolt against the Classic meant merely that they consulted Byron and Scott where the older school had searched their Plutarch. But to Daumier, subject was nothing; everything depended on the way of looking at it. To him there was romance in the washerwoman as in the Knight of La Mancha, in the emigrant as in Sancho Panza. His inspiration was not in the Laras and Mazeppas, the Pirates and Corsairs, the Fausts and Margarets, then so popular, but in the space of white wall transfigured in the sunlight, in the dramatic swing and rhythm of a crowd rushing through the street, in the character of a face. He was a poet in paint, and he thrilled to the harmony of color, the melody of line. I returned again and again to the gallery (No. VIII.) where these masterpieces are hanging; the near Lamis and Devérias disappear before them, and I do not believe it will any longer be possible not to give him the place that is his by rights among the painters of the century. I notice that the canvases come from private collections; it is time as representative a series should hang in a national museum.

In the Exposition, Courbet precedes Daumier, but I have waited to speak of him because he is more closely related to the Barbizon group that follows. Upon the men of this group no new light is thrown, nothing added to our knowledge of them. Fortunately, Courbet, Troyon, Millet, Rousseau, Diaz, Corot, Daubigny, Dupré, Jacque, Monticelli have not had to wait until now to be awarded their proper rank as artists. They had their struggles for recognition, as so many great artists have had and probably always will have; they had their years of official neglect when canvases, now found worthy to adorn the walls of the Louvre, were banished to the Salon des Refusés. But they outlived the first burst of scorn and contempt; even Millet, who, in his biographies, figures as the life-long martyr to academic and bourgeois ignorance. To-day, their pictures have but to be put up at auction to complete their vindication in the eyes of the collector; the artist, of course, always knew their value. I have seen finer single examples, but never a more representative series. There are, for instance, early landscapes by Corot, in Rome, in Chartres, in which his manner was lighter than in the more familiar and accomplished idyls of his maturity, and also many of his rare portraits and figure subjects. Monticelli also appears in his different periods, more completely in the noblest of all, when his fantasies were the painted music they have been called, full of the clangors of gold and scarlet and bronze. There are several of the portraits Courbet never tired of painting of himself—among them, the stilted, youthful, promising "Bonjour, Monsieur Courbet," from the museum at Montpellier; there is as curious an early portrait of an officer by Millet; while Daubigny, and Troyon, Dupré, Diaz, and Jacque can be as thoroughly studied. The several galleries devoted to these landscapes make virtually an exposition within the Exposition.

However much the men of the little group differed, in style and method, in one respect all were agreed—except, perhaps, at times, Courbet, I mean in their love for beauty, whether of tree forms or sunlight, of vast aerial distances or running water, of the quiet village by the lake or the mysterious forest depths, of cattle at pasture or peasants in the field. If they rose joyfully to the challenge of Constable and Bonington, they could not altogether forget Claude and Poussin. To pass from them at once to Manet, and Degas, and Monet, as you must if you adhere to the order of the Exposition and of time, is to feel less surprise at the universal condemnation with which the younger generation of painters, whom also the public has learned to accept, were, in their turn, greeted upon their first appearance. The two schools are as far apart as if centuries separated them; the reason, it may be, why the work of Manet, Degas, and Monet hangs in the upstairs galleries, an immediate prelude to the modern or Decennial Collection; certainly the reason why I wait to speak of it until I begin my account of this modern collection.

N. N.

SOME PIEDMONTESE SANCTUARIES.

ALASSIO, May, 1900.

Nearly all the Americans who have visited Italy will have memories of some sanctuary, a pilgrimage church, wherein the walls about a gaudily decorated altar are hung with hearts in beaten silver, interspersed with legs and arms in the same metal; all of them tokens of gratitude for miraculous cures or other graces of the Madonna or saint to whom the church is dedicated. Occasionally the church has some charm of architecture, of painting or sculpture, or of picturesque arrangement; but in general the impression left is of tasteless splendor, and, incidentally, of the boundlessness of human credulity.

But how many travellers are there who know anything about a little group of sanctuaries of an utterly different type—quite unlike, indeed, so far as I know, anything to be seen elsewhere—all gathered almost within sight of one another in a corner of Piedmont, which, in respect of art, is generally thought of as a sort of Cinderella among the divisions of north Italy! *Almost within sight* is a figure of speech; they are all within a radius of fifty kilometres from Novara, and this centre is visible from two, at least, of the sanctuaries. Of those who have seen their glories, few have celebrated, or ever felt, their value; partly, no doubt, because these have not as yet had the fortune to receive the stamp of approval of any of those popular writers who, in matters of art, inform the crowd where it is to place its enthusiasms; and also, it may be owned beforehand, because it is not always easy for the ignorant to separate the gold from the dross, and these jewels are of a sort not readily to be appreciated by them.

Moreover, the sanctuary of this group most frequently seen is lowest in artistic importance. In the times that preceded the introduction of railways, the passage over the Simplon was a favorite among the exits and entrances of Italy. In those days an even larger number of foreigners in proportion to the whole than now learned to appreciate the exquisite little lake of Orta, with its homonymous village, loveliest among those of north Italy. The summit of the hill behind the village is crowned by a grove of great trees that throw a checkered shade upon the turf beneath, and scattered here and there are about twenty chapels of late Renaissance architecture, many of them charming, and each one consecrated to a representation of some scene in the life of St. Francis of Assisi in colored terracotta statues of life size. These are set in a painted architecture or landscape. Unfortunately, the execution is not at the level of the intention; the groups are, almost without exception, tame and wax-figury. It is because the spot is so lovely, the chapels so pretty, and the views of lake and mountain of such beauty, that the visitor lingers and returns with pleasure.

No one need wonder, then, that the impression gained at Orta should affect the visitor's judgment in the other and less known places. "Chapels with colored statues in them like those of Orta." And this would be fairly true of one of the other sanctuaries, the Sacro Monte of Varese. Statues and painting are both largely by the same artists who worked at Orta, all seventeenth-century men. It there be a difference in their achievement, it is that at Orta the groups are academically tame and feeble, while at Varese they are more theatrical and violent. At the latter place the subject is the Mysteries of the Rosary, distributed through fourteen chapels bordering a steep ascent, whence is obtained a superb view over the lake country set in mountains towards the north, and southward over the plains of Lombardy and Piedmont. The spot is charming, and, if for no other reason, at least you are grateful to the chapels for having brought you there. However, one who has observed the groups more nearly than I can pretend to, declares that, even amid the pompous feebleness, there are now and again certain figures that stand out from among their fellows, as, often, a star actor from the troupe by whom he is surrounded.

But go to Varallo in the beautiful valley of the Sesia, where is the most important of these sanctuaries, and you may get to see that the colored statues were sometimes the work of artists whom it is no exaggeration to call great. One might go to Varallo for the landscapes alone, or for the picturesqueness and local color, which have their own peculiar place in the infinite variety of Italy, or for the fresh air and the summer resorts of Monte Rosa. One might even make of the way a Bacchic pilgrimage for wines unknown to the general traveller, or even to most Italians, and which make one wonder why the hotel-keepers never give anything like that to drink. I will say nothing of the vintages of Grignolino and Gattinara, for their names, if not their virtues, are known; but, if opportunity serve, I would recommend to the knowing to try Ghemme and Lessona and Sizzano, and then to venture upon others that I pass over in silence. He may enrich his experience and at the same time his store of pleasant memories; for Italy, thanks to the treadmill round that the ordinary tourist makes in it, is a land flowing with nameless nectars that minister an innocent gladness to those who succeed in finding them out. Finally, at Varallo, aside from the Sacro Monte, there are in and about the place treasures of art for the lovers of the unhackneyed. I mention one, at least, of these, as your Baedeker would leave you in ignorance of it and it is not one of the things to be neglected. At Quarona, an hour's walk from Varallo, there is in the village church an altarpiece, Madonna and child, attributed to Gaudenzio Ferrari, that would pay you for going five times as far.

But we must not forget that we have come to Varallo for the Sacro Monte, the precipitous height that towers above the town. On the top is a "New Jerusalem," said to have been founded toward the end of the fifteenth century in imitation of the sacred places of the elder Jerusalem. It has grown beyond the original intention, and is now occupied by some fifty chapels, all of them, with the exception of one devoted to a representation of the Temptation in the Garden of Eden, filled with scenes relating to the life and death of Jesus Christ. At the foot of the shaded road that mounts from the town to the summit is the church of Santa Maria delle Grazie, which may well occupy an hour either before or after the ascent. Between the nave and the choir is a screen that mounts to the roof, after the fashion of that in Santa Maria degli Angioli at Lugano, and, like that, covered with magnificent frescoes. These two screens—sole examples of their kind, so far as I now remember—are relatively examples of the two masters whom, in this region, one is so often tempted to compare, Luini and Gaudenzio Ferrari, the former at Lugano, the latter here at Varallo. The screen is divided into twenty-one compartments filled with scenes from the life of our Lord; the central one, the Crucifixion, being equal in space to four of the others. The work is all of one period, 1513, and is in excellent preservation. It has the peculiarities of Ferrari's earlier manner, the use of gold and of actual relief in many of the accessories (horse-trappings, armor, haloes, etc.—as also in Pinturicchio's frescoes in the Borgia rooms at the Vatican), the extremely long fingers on most of the hands, etc.; but at the same time it displays the artist's feeling for beauty and sincere religious sentiment in all their force, and is perhaps more completely representative of his genius than any other single work of his. In two of the chapels on the mountain above are frescoes of his maturity, but they are badly damaged, fragments and shadows of what they were. It may be remarked that in some of the mountain valleys about Varallo one meets occasionally beautiful faces of the types portrayed by Ferrari, just as one frequently meets the women of Luini in the streets of Milan.

At first sight the figures in the chapels on the mountain are disappointing. Not only has one to combat one's contempt for painted figures and one's reminiscences of wax-figure shows, but one finds a good deal at this particular show in shabby condition. The statues are frequently in a sad state of dilapidation, or they have been dressed in tawdry finery, or suffer from want of repainting or from too much of it, or have wigs of tow or horse-hair stuck on to their native baldness; but, if one be not discouraged by the first hasty glance, the seriousness, the force, the truth of many of the figures soon make themselves felt, and gradually comes a conviction that some of these statues are works of genius. Some of the groups are seen to be full of life, and even the painted backgrounds are often of great beauty. In two cases, that of the chapel of the Crucifixion, and especially in that of the Visit of the Magi, the frescoes were among the strongest and most beautiful efforts of Gaudenzio Ferrari at his full maturity. What remains of them justifies this assertion. In the former of the two chapels, the statues also are supposed to be by him. Of course, this is no place for an enumeration of the subjects and artists of the five and forty chapels. Many of the groups in them do not rise above the wax-work-show level; many of them are barely commonplace; but, aside from Gaudenzio Ferrari, there are two sculptors, at least, who stand out so from their fellows as to command our special attention.

One is struck at finding the greater part of the better groups ascribed to one man, Giovanni D'Enrico, who worked here for many years previous to 1645. Among the groups that bear his name are the Ecce Homo, Christ before Caiaphas, Christ before Herod, Christ condemned to death, Pilate washing his hands, and, finest of all, Christ being nailed to the cross. These are more than sufficient to put the great talent of the author beyond doubt, though on examination many of the figures are found to be inferior to the better ones, and you are glad of the explanation that D'Enrico, like Rubens, had the habit of leaving a great deal of his glory to be won by his pupils. Figures like that of Caiaphas, and some of those in the Nailing to the Cross and Ecce Homo chapels, make one regret that he was not content to produce less and do his work by himself.

But a far greater man than Giovanni D'Enrico has given here the measure of his power. In the Eve of the first chapel, in that of the Temptation in the Wilderness, of the first Vision of St. Joseph, and in the populous one of the Journey to Calvary, one is surprised by figures of a force and vitality that, through all the disguises and injuries of time, are clearly revealed as masterworks. On inquiry, they prove to be by a man of Flemish origin, Tabaquet, known in Italy as Tabachetti, who came here toward the end of the sixteenth century. The histories of art, not to be wanting to their fatal inadequacy, make little or no mention of Tabachetti, while celebrating many geniuses of not half his value. I would not go to the length of Mr. Samuel Butler, whose amusing and very clever book* ought to be in the hands of every visitor to Varallo, when he exalts Tabachetti above Michelangelo, and says that, were he given a choice whether to have created the figures in the Medici chapel or those of Tabachetti, he "would not for a moment hesitate about choosing Tabachetti's, though they drove their unhappy creator mad, which the Medicean chapel never did by Michelangelo." But, in the presence of some of Tabachetti's statues, one may share Mr. Butler's enthusiasm without repeating his language.

There are works by unknown men—the Massacre of the Innocents, for example—that will repay a good deal of study, and single figures, as that of a man tugging at a rope in the chapel of the Flagellation, or that in the chapel of the Descent from the Cross, known as Il Vecchietto, the little old man, which, if not done by Tabachetti, would prove that he had his peers among his fellow-artists. Perhaps it is more reasonable to suppose that Tabachetti himself was the unaccredited author of these marvellous statues. They are, like all the rest, of an uncompromising realism; indeed, it is hard to believe that the Vecchietto is not an unusually picturesque example of the flesh and blood of one of these mountain valleys. But the realism of Tabachetti and his fellow-artists does not content itself, *more hodierno*, with the reproduction of ugly or brutal types, though there are plenty of these, but occasionally gratifies our longing for the beautiful. Tabachetti's Eve, for example, is of a loveliness that, once seen, is not readily forgoten.

The architecture of the chapels is similar to that at Orta, and some of its combinations charming; but the buildings are so arranged that there is scarcely a peep out over the surrounding landscape, and, notwithstanding the abundance of great trees on the mountain, there is little, comparatively, of the sylvan character that delights the visitor at Orta.

This group of sacred mountains includes one more, that of Crea, least known of all, but in importance second only to Varallo. It may be visited either from Serralunga or from Moncalvo, both on the line between Casale-Monferrato and Asti. There is an inn among the buildings on the summit, but I know nothing of it. The probabilities are that, unless the visitor happens to be a guest in one of the castles that crown nearly all the innumerable hill-tops of the region, he will have to content himself with a single brief inspection of the treasures of the Sacro Monte. I have left myself so little space that I can indicate but three or four of these. In the main church, besides a very fine altar-piece by Macrino D'Alba, there is a chapel decorated on all sides by beautiful frescoes by Spanzoti (or Spanzotti), master of Sodoma, according to some; by an unknown painter of Pavia in the employ of the Duke of Monferrato, according to others. Unfortunately, the chapel is so dark that the frescoes are usually shown by candlelight. On one occasion, when the great doors of the church were wide open, the light of the western sun streamed in towards the chapel, and I had a twilight view of them. It is a mystery how they were ever painted, and a still greater one that they should have turned out so beautiful. Among the outside chapels, incontestably the most important is the first on the way up from Serralunga. The subject is the Martyrdom of St. Eusebius, who was stoned to death in front of the fine church of St. Andrew at Vercelli. The frescoes are by Guglielmo Caccia, known as Moncalvo, a post-Gaudenzian painter, and the statues, by Tabachetti, are extremely interesting. I shall never forget the powerful figure of one of the stoners—this said without prejudice to the others.

Crea has two or three chapels filled by sculptors of to-day, and one of them, the Journey to Calvary, by Bistolfo, counts among the most noteworthy achievements of recent Italian sculpture—or rather of modelling, since the figures are in plaster of Paris. Elegance, grace, distinction, and a certain gentle pathos are the chief characteristics of the work. These are quite enough to lift it above mediocrity, or indeed above any of the ancient groups, excepting those due to the genius of Tabachetti.

It only remains to be said that the hilltop of Crea is covered with a dense wood, in which one comes upon the chapels as surprises. There are outlooks, however, and from one (where, by the way, is an astonishing representation of Paradise) the panorama spread before one is superb, extending from Monte Rosa in the west to Milan in the northeast, with Vercelli and Novara as soft dark patches in the blue haze that overhangs the valley of the Po, and to the south the range of the Ligurian Apennines. At night the electric lights of Novi may be seen on the further edge of the plain underlying these mountains. S. K.

Correspondence.

INTRINSICATE, INTRINSECATE.

TO THE EDITOR OF THE NATION:

SIR: Among the old dramatists who have this word, Shakespeare was neither the first nor the last. There exists, however, hitherto unnoticed, an earlier authority for it than any of them, namely, the translator of the Second Part of Macchiavelli's *Arte of warre:*

> "The exercises of warre, seeming unto them partly not necessary, partly an *intrinsicate* matter, whiche they understande not." Peter Whitehorne, *Certaine Wayes for the ordering of Souldioures in battleray*, etc. (1562), fol. 40 r. (ed. 1573).

Intrinsicate is irreflectively derived, by Theobald, from the Latin *intrinsecus*, or else from the Italian *intrinsecarsi*, though the context, wherever he had met with the strange term, plainly indicates what it was intended to signify. Dr. Johnson, drawing his bow at a venture, and that a wild one, is of opinion that it "seems to have been ignorantly formed between *intricate* and *intrinsecal*."

How did the dramatists come by *intrinsicate?*

Improbable, with near approach to impossibility, is the supposition that any two persons, whatever their notions as to its genesis, can have brought it forward independently. Must not, then, its adoption by Shakespeare and the rest, as substitutable for *intricate*, have originated from its use seen in the quotation given above, or occurring elsewhere? This view is surely colourable, in presence of the fact that "intrinsecate matter" renders *viluppo*, "intricacy." Had he essayed to enrich our mother-tongue by adopting a full-bodied synonym of "familiar" from the Italian, Whitehorne would not have missed the mark in his neoterizing. His *intrinsicate*, a fancied improvement on *intricate*, was, pretty clearly, due to somebody's misapprehending the sense of *intrinsicato* or *intrinsecato*.

---

* *Ex Voto:* An Account of the Sacro Monte or New Jerusalem at Varallo-Sesia. London: Longmans. 1890.

Playfully and otherwise, Shakespeare has minted a good number of barbarisms, one of which is *intrinse*. This, being in *Lear*, is earlier than the equivalent *intrinsicate* of *Antony and Cleopatra*. Both words the Rev. Professor Skeat uninquiringly identifies with *intrinsic*.

Was Dr. Johnson acquainted with any unetymological monstrosity at all matching *intrinsicate* as he was disposed to account for it? Be this as it may, we of later times are acquainted with one in Mr. and Mrs. Browning's *adaptitude*, the lady leading the way. Pity it is that eccentrics, if they will produce such deformities as this, with *electrocute*, *imson*, *oratund*, *phillog*, *utian*, and the like, should perpetrate their felonies in the eye of the public.

Though it would have been no accession to our language to Anglicize *intrinsicato* in its proper acceptation, yet, as regards another Italian vocable, *scienziato*, Dr. Whewell, if he had proposed to invest it with an English dress, would, besides avoiding a breach of analogy, have precluded copious ink-spilth. That *scientiate* was once used here is the proof:

> "Such as will learne an Art or a Science, the first object that they set before them is not immediately that of the Art, or that of the Science, but an Artist, or a *Scientiate*, and that not the greatest neither but the nearest. . . . When the Artist or *Scientiat* hath arriv'd," etc. Anon., Translation of Malvezzi's *Pourtract of the Politicke Christian Favourite* (1647), p. 100.

F. H.

MARLESFORD, ENGLAND, June 19, 1900.

Notes.

McClure, Phillips & Co. announce 'The Gavel and the Mace,' a guide to parliamentary practice by Frank W. Hackett, Assistant Secretary of the Navy; an 'Encyclopædia of Etiquette'; and 'The Trust Problem,' by Prof. Jeremiah W. Jenks of Cornell University.

Noyes, Platt & Co., Boston, give their imprint to a very tasteful little Official Catalogue of the American Fine Arts Exhibit at the current Paris Exposition. It contains the personnel of the Commission of the Department, the national juries convened on both sides of the water, biographical sketches of the American contributors, the catalogue of works, and half-tone examples of these.

'The Associate Hermits' carries on the altogether handsome uniform edition of Mr. Frank R. Stockton's ingenious fiction; and a companion volume is numbered one of "Stories," with "The Lady or the Tiger" at the fore, followed by its sequel and other short pieces (Scribners).

The Scribners have entered the lists where publishers contend for cheaper editions of Carlyle's 'French Revolution.' Theirs makes a plump octavo volume of 800 pages in fair type, and is provided with a certain number of illustrations after old prints, in rather odd selection, so far as portraits go. The index, as we remarked recently of a rival edition, is a copy, and of itself lends no distinction or special value to the reprint, as it might have done.

Mr. Moncure D. Conway's 'Thomas Paine,' to turn to a kindred work, has been done into French by Félix Rabbe (since deceased), and handsomely published by Plon-Nourrit & Cie., Paris. Mr. Conway's increasing exploitation of this theme is well known, and prepares one to learn that whoever wants his completest tale about his hero must resort to the present translation. Some excision has taken place also, however, and the French and English presentations are needed to supplement each other, even though the former be "en grande partie un ouvrage nouveau," as Mr. Conway explains in his preface. The author appropriately chooses for his frontispiece a portrait by Laurent Dabos, a painter of Toulouse.

A scholarly little book, printed very attractively in a first American (third English) edition, is W. Arnold Buffum's 'Tears of the Heliades,' an essay on amber as a gem; more particularly on Sicilian amber so used. The subject has seemingly been thoroughly ransacked on the historical side by one who is a collector as well as capable of bookish research. The agreeable chapters abound, too, in classical and vernacular poetical quotations, pretty descriptions, even romantic incident. There are one colored illustration and two photographic, besides a geological section of the Amber Coast.

'Appletons' Annual Cyclopædia' for 1899 differs in no essential feature from the long series of which it is the latest issue. It has a map of China to serve roughly for reference in the present extremity, and its three larger portraits are of the late Gen. Lawton, Paul Krüger, and President Loubet. The editor's pretension to "clearly set forth" "the causes, the processes, and the result so far as reached" of the wars in the Philippines and in South Africa is violently negatived by his account of the occupation of Manila and the subsequent outbreak of hostilities between Aguinaldo and his followers and our forces. It is not too much to call the statement on p. 695 a gross perversion of the facts. The survey of the year's literary output, American and foreign, being an uncritical listing of titles, would be more intelligibly and usefully reduced to a frank classified catalogue, so printed as to permit the eye to run over and take it in easily.

The Robert Clarke Co. of Cincinnati publish the 'Recollections of a Lifetime,' by Roeliff Brinkerhoff (8vo, pp. 448). Gen. Brinkerhoff is best known by his long devotion to prison reform and to the improvement of hospitals for the insane and idiotic. He has taken an interest also in archæology and genealogy (especially that of the Brinkerhoff family). The natural outcome of these tastes is the compilation of his own Recollections of a lifetime which has brought him in touch with interesting people and events. In very early life he was tutor in the Donelson and Jackson families in Tennessee. Returning home, he threw himself into the anti-Nebraska movement and into the new Republican party. During the civil war he was a quartermaster, having large responsibilities in depots for the purchase and distribution of supplies. He was later a revenue reformer and an independent in politics. He had personal acquaintance with many leading men in political life, and enlarged the circle to include those most prominent in the benevolent activities to which he has given his later years. The revision of his MS. for the press has been too careless, with the result that many minor errors have escaped his notice. The proof-reading is also very faulty. In paper, type, and presswork the volume is excellent, and the matter was worth greater care in the other respects mentioned.

In the fourth and last volume of 'How England Saved Europe' (Scribners), Dr. Fitchett reaches his most patriotic heights. His subject is the warfare on French soil in 1814-'15, leading up to the abdication at Fontainebleau and then to Waterloo. Chapters on St. Helena and Napoleon's historical character are also furnished. As it is Dr. Fitchett's thesis to show that England actually did save Europe from ruin, he is led to describe Bonaparte's malignity in the colors of the pit. "He scorned truth. He worshipped force. He was absolutely pitiless. He erected selfishness into a law. He counted himself apart from morality, or above it. Religion to him was a tool, and capable of being used for very irreligious ends. He poured out human blood like water. . . . He substituted 'glory' for 'duty' in human ethics. He slew his own conscience, and did much to slay the conscience of the world. Yet all this, when seen in retrospect, failed to stir him with a thrill of pity or prick him with a pang of self-blame." In a word, what Seeley is to Thiers that Dr. Fitchett is to Seeley. Every demerit of Napoleon, moreover, is turned to the glory of England. Such volumes do not contribute to the friendship of nations, but, on the other hand, we must applaud Dr. Fitchett for closing his series of red-covered and somewhat fiery volumes with a panegyric of peace.

Dr. Emmet Densmore's 'Consumption and Chronic Diseases' (New York: The Stillman Publishing Co.) shows one of the tendencies of the age to strike into paths not marked out under the authority of the schools, and as such it has its good and its objectionable sides. The writer describes vividly the remarkable results obtained in the treatment of pulmonary consumption in sanitaria where reliance is placed almost exclusively upon three influences, abundant food, rest or freedom from undue fatigue, fresh air. The book is written to demonstrate that the essentials of the treatment can be carried out at home. By "fresh air" is to be understood, however, not alone reasonable ventilation, but a life spent out of doors, or in rooms in which the windows are partly open summer and winter, day and night. By "food" is meant a quantity which will insure a rapid gain in weight, to be taken whether the patient wants it or does not. The author advocates the exclusive use of milk for this purpose, a dose being taken every forty-five minutes or so throughout the day. Valuable suggestions are made with regard to clothing, exercise, and other matters, yet they should not be adopted wholly at random. Fresh air, to be safe, should be almost continuous, and milk, as an exclusive article of diet, is certainly not without its objections, and we cannot avoid the suspicion that, when it is found so useful, it is because it shares the power that attaches to all exclusive extremes, to secure enthusiasm and confidence which reason and reasonable methods cannot inspire. Nevertheless, the principle advocated is of high importance.

New modes of locomotion call for a new class of guide-books. Miss Katharine M. Abbott, who began by showing what trolley trips were possible and interesting on the New England coast, from and to Boston, has now undertaken the same service for the District of Columbia, and publishes, through G. P. Putnam's Sons, an illustrated pocket volume entitled 'Trolley Trips in and about Fascinating Washington.' The open electric conveyance is thus made to conduct the stranger confidently to the chief sights of a city in the shortest possible time, with a minimum of fatigue and of expense. A map makes the routes easily comprehended in advance, and is an added insurance against "getting lost."

Students of the classics, as well as those interested in the history of the woman movement, will read with satisfaction a brochure by Prof. Ivo Bruns of Kiel: 'Frauenemancipation in Athen; Ein Beitrag zur attischen Kulturgeschichte des fünften und vierten Jahrhunderts' (Kiel: Schmidt & Klaunig). The first part of the treatise is a defence of Euripides against the accusation of misogyny, which in manner recalls Lessing's 'Rettung des Horaz.' The inferences which the well-known scholar draws from the Attic writers of the fifth and fourth centuries suggest the most striking analogies between our modern woman movement and the Athenian, which reaches its climax in Plato's 'Republic.' But the philosophers of the fourth century, so the writer argues, received all the postulates regarding the condition of woman from the preceding epoch, during which public opinion was greatly agitated over the problem. This pamphlet is of "culture-historical" interest, also, as indicating a transitional stage between the use of Latin and of German in university affairs. On the title-page and the last inside page we find, in Ciceronian Latin, the announcement of, and invitation to, the celebration, in the University aula, of the Emperor's (latest) birthday, on which occasion one of the professors was to express in a *German* oration the common sentiments of deep affection—"oratione *patrio sermone* habenda communia omnium vota auspicatissima pronuntiabit."

'Das herrschende Schulsystem und die nationale Schulreform,' by Prof. E. Dahn (Kiel and Leipzig: Lipsius & Fischer), is not a well-written book, but it may serve a useful purpose as a source of information supplementary to any or all English books on education in Germany. It deals almost exclusively with secondary schools, and the author, as director of one of these, and as editor of the *Pädagogisches Archiv*, knows much about inside affairs, about the weal and woe (especially the latter) of the teachers and pupils in these institutions, that no foreign visitor can ever find out.

Asher & Co., Berlin, have recently published a volume on the German workingmen's insurance system: 'Einrichtung und Wirkung der deutschen Arbeiterversicherung.' The magnitude and success (for so much must be acknowledged even by disbelievers in this kind of State Socialism) of the organization is shown by the fact that since 1885 more than two billions of marks have been paid in indemnities to workingmen and women through this Government institution; the amounts contributed to the insurance fund by the workingmen, the employers, and the Government being, respectively, 1,164, 1,099, and 150 million marks.

Three Bulletins of the Copyright Office at Washington afford the freshest guidance to owners of literary property. No. 1 (4th ed.) gives the Copyright Law of the United States in force July, 1900; No. 2 (part ii.) gives instruction for Registration for Copyright Protection within the British Dominions; No. 2 (part iii.) contains the Rules and Forms relating to Copyright Registration in Canada, together with the Canadian Copyright Law of 1886.

A special American-South African number of *Hollandia*, "a weekly illustrated paper for the Dutch-speaking world at large," is by exception wholly in English. It is an appeal for American intervention against the operations of the game of war which the Boers initiated. It arrives when all eyes in America, as in Europe, are turned Chinaward to a much more stupendous drama, and when the Roman occupation of the late South African republics has gone so far as to put intervention out of the question. In judging whether the war is glorious or inglorious for England, some of the argumentation of *Hollandia* will have weight; but that other question, whether the Boers have the same claim on the world's sympathies as baffled invaders of British territory that they would have had if they had simply resisted within their own borders, is not to be settled by historical retrospect carried back of October 9, 1899, the date of the Boers' ultimatum.

Consular Reports for June contains a comprehensive account, with numerous statistics, of last year's Russian petroleum trade, from which it appears that though more work has been done than in 1898 and the total production has increased, by nearly five million barrels, to sixty-three millions, the results have been less satisfactory. The wells have increased in number, but the daily average output from each well has fallen from 199 to 174 barrels, and the cost of production has seriously increased. "The limit of drilling operations," it is inferred, "has probably been reached." There is also a curious report of the French system of taxation, and a short but suggestive article by our Consul-General at Berlin on Germany's food supply. He notes that the population of the empire has nearly trebled during the past century, and the agricultural products, by reason of scientific culture and freedom from the destruction and waste of local wars, have nearly quadrupled. This is offset, however, by a "vast and increasing diversion of these products to other than life-sustaining purposes in the form of food. Nearly the whole of the barley crop is malted and used for the manufacture of beer; potatoes and maize in vast quantities are devoted to the production of alcohol, and the best lands of Germany are now devoted to the culture of beet-sugar, the greater portion of which is exported." Another report calls attention to the greatly increased cost of living in Germany and the disproportionate advance in wages.

The annual report of the Woman's Education Association of Massachusetts shows a wide range of useful work, from the provision of fellowships for foreign study, the maintenance of the American Women's Table at the Zoölogical Station at Naples, and the sending of twenty-nine travelling libraries and seven picture sets to the rural towns, to the promotion of vacation schools in Boston and the labelling of the trees and shrubs in the Back Bay Fens. The special subject to which the attention of the Association has been directed during the past year has been the place of moral education. The mere acquisition of knowledge should no longer be regarded as the chief purpose of education, but "the building up of character must be part of the teaching in our schools."

Was the Epistle to the Hebrews written by a woman? is the novel question raised by the brilliant church historian of the Berlin University, Professor Harnack, to which he gives the equally surprising answer that in all probability this is the case. His discussion of this problem, which constitutes the *pièce de résistance* in the first issue of the new *Zeitschrift für neutestamentliche Wissenschaft*, is a skilful combination of the condition of affairs as presupposed by this anonymous letter, with what we know of the character and history of the noteworthy couple, Aquila and Priscilla. He concludes that this letter is the product of their pen; the wife in all probability, chiefly on account of the total suppression of the author's name by even the earliest literature, having been the chief factor in the composition. Harnack does not pretend to have discovered any data in the literature of the Apostolic period that would directly or indirectly connect the name of Priscilla with the authorship of Hebrews. His argumentation is entirely along the line of inner literary and historical criticism, and is a model specimen of this kind of analytic and constructive research. The author frankly heads his article "Probabilia."

—The sixth volume of the 'Life and Correspondence of Rufus King' (Putnam) completes the work, and shows how active King was in the last eleven years of his life. The Federal party had committed suicide, as Gore said, and Monroe in the Presidential chair gave an administration that was commonplace, and more remarkable for the intrigues of members of his Cabinet for the succession than for its own merits and statesmanship. "The election of a Pope is purity, simplicity, and certainty when compared with the system of electing a President by a caucus. The conclave of Cardinals are closed, and soon walled up, while the caucus of Congress to elect a President is composed of members who separately confer with whom they please, and for one or two years carry on the intrigue to choose a President." So King wrote in 1823, when four candidates were in the field. He had been reëlected to the Senate in 1820 under conditions very flattering to himself, and still exercised much influence by his moderation, wide knowledge, and experience. In the muddy politics of New York he was active, favoring a convention to revise the Constitution, and much opposed to the Clinton faction. It is extraordinary to find him seriously recommending Van Buren for a position on the bench of the Supreme Court, and he does not seem to have understood that smooth and dexterous political manager. As a Federalist, he disliked John Quincy Adams; and when Monroe spoke slightingly of the Federalists, a coolness arose between King and the President.

—In domestic affairs much of importance was done. On the Missouri question King took a leading part, and he argued against slavery on the highest ground, that man could not enslave man. He did not believe, however, that the institution could be touched by Congress in States where it already existed. The passage of the compromise was fought ably, and, when accomplished, was looked upon as a defeat absolute and complete. "The pretended concession, for it is revocable at pleasure, is itself of no value, and has been provided as an apology to the members of the free States who have assisted in putting us under a Government of the privileged order of men who are henceforth to be and for ever to remain our masters." It was King who framed the Navigation Act of 1818, but the conditions of American commerce then seemed to justify such a law. These conditions have long since passed away, and the law should have been repealed. At the close of his term as Senator, when he was in his seventieth year, he was offered and accepted the English mission, but held it only for a year. In this last volume will be found an abundance of new and interesting materials on State and national issues and politics. The editing has been judicious, although complaint might be made of the long extracts from the annals of Congress and Adams's Diary, necessarily occupying space which could be filled with original matter. The "memoranda" on p. 427 should have been dated 1820, not 1821.

—The inaugural address of Professor Macdonald of the Hartford Theological Seminary has been reprinted under the title of 'Muslim Jurisprudence.' Since our advance into the Sulu archipelago, the difficult subject to which this pamphlet introduces us can no longer be regarded as purely academic. An original analysis is here given of the sources of Muslim Law, and a sketch of the four famous schools by which that law has been expounded and developed. The treatment is so lucid and so far from dry that he who runs, and even he who skips, may not only read, but be interested. At the base of these legal systems lies, first, what we may term Statute Law, namely, the revelations promulgated by Muhammad and embodied in the Qur'an; second, what may be called Case Law, consisting of precedents derived from Muhammad's usage as preserved by history or tradition. Upon that foundation, by means of what Austin calls "illations and deductions," and by skilfully added theories of their own, the ingenuity of countless generations of jurists has built up these elaborate structures. The dictum of Sir Henry Maine, that all law has been developed, first through legal fiction, next through equity, and lastly by legislation, is true only in part as applied to these systems; for legislation in the ordinary sense they have never known. The spectacle of a law expanded and modified by text-writers for more than a thousand years, yet not amenable to the will of any sovereign or any legislative body, is indeed calculated to astonish the Western mind. How then, we ask, has this law been amended so as to deal with the changing conditions of the vast Muslim world?

—That is the question answered by this essay. Each of the great jurists devised some progressive principle—which we may roughly denote by that "slippery expression" Equity—wherewith to override or mitigate the rigors of the older law. In the school of Abu Hanifa this equity was based on Preference—*i. e.*, the jurist's choice of what was fair and just. The equity of Malik was founded on what we should now call Public Policy—*i. e.*, the judge's view of what was to the public advantage. In the hands of ash-Shafi'i the remedial principle took the form of upholding rules settled by Agreement—*i. e.*, such as had been accepted by a consensus of Muslim opinion. The last principle was the most fruitful of the three. "The hope for the future lay, and lies, in the principle of the Agreement." Professor Macdonald points out that the Muslim jurists learnt their methods of legal interpretation from those opinions or general statements laid down by the Roman *jurisprudentes*, and of which Justinian's Digest so largely consists. The analogies are many and striking. So, also, the Muslim principle of Agreement reminds one of the rescript of Hadrian, which ordained that, if the opinions of the licensed *prudentes* all agreed, such common opinion had the force of statute; but, if they disagreed, the judge might follow which he chose. We trust that the author may some day expand this valuable essay, since shortness is its only shortcoming. The difficult task of producing compactness without density has been admirably performed.

—All the manifestations of State medicine have a common motive, the prevention of disease. It is near the root in principle, although late in development, to engage that the children assembled in schools be neither damaged nor put in risk thereby. But whether caused by the schools, or merely noted therein, it appears that "observation and special research show that a considerable percentage of the children in schools are in such a condition of ill-health that their physical development is vastly more in need of special attention than their intellectual development." There do not seem to be statistics to differentiate the conditions caused by improper furniture, overcrowding, poor construction, unreasonable hours, etc., due to the school as such, from those connected with the children as independent causes. But the large public schools of our cities may be choked with opportunities for the spread of the ordinarily recognized contagious diseases, and with continuing physical influences that depress susceptible youth. The latter are an atmosphere saturated with organic débris and with the general emanations from the body that create crowd-poisoning. These are independent of the physical evils generated in or fostered by the imperfect bodies in which so many of our souls abide. No school officer whose ordinary duty is instruction, however well trained, can do more than observe the concrete consequence. He may notice that a child is obviously ill or manifestly defective. His duties to the whole carry him beyond those that are sick. As a teacher he is charged with teaching, not with house-building, nor body-building, nor with the repair of either. There should, it is reasoned, be a responsible physical director, competent to detect, and possessing authority to remove, the cause of offence. To follow this to its conclusion involves a discussion as to the limits within which, if at all, the State should compel public or other medical service to be invoked, beyond merely affording opportunity for its voluntary use. If vaccination, as it certainly should be, is compulsory, and diphtheria must be isolated, must incipient consumption be segregated, and should the State destroy the mosquito host of the malarial parasite as it does the gypsy-moth and the scale-insect? These remarks are based upon an interesting but incompressible paper on "Health Inspection in Schools" by Prof. William H. Burnham of Clark University in the *Pedagogical Seminary* for April last.

—Perhaps no small fact is more pregnant with the character of our anæsthetic age than the decline in the popularity of the celebrated treatise of Boethius. It is not to philosophy that people who fancy themselves terribly stricken nowadays go for consolation. They more often, whether rich or poor, betake themselves to travel. They cannot any longer understand how such indisputable woe as that of the author of the 'De Consolatione Philosophiæ' could have the heart for such an artificial style of composition. The reason is, that the Gorgon terrors of adversity are no longer remembered. They are among those picturesque features of the good old times which the prosaic nineteenth century has expunged, except from seats of war. Nevertheless, we have to record the appearance of the third English edition of the 'De Consolatione' within as many years, and that without counting Middle-English or Anglo-Saxon recensions. Dr. Walter John Sedgefield, editor of King Alfred's version for the Clarendon Press, has now brought out, through the same press (New York: Henry Frowde), a translation into modern English. Nobody would seek acquaintance with the work itself in this volume. On the contrary, its interest lies precisely in its great departures from the original—the ruthless excision of many of its fine passages, which marks King Alfred as a regular blue-pencil editor, and the still more remarkable and numerous insertions, which certainly throw a great deal of curious light upon the character of the English hero. Dr. Sedgefield has provided the volume with an entertaining introduction of over forty pages, which, after dealing with Boethius and with Alfred, branches off upon the subject of the previous English versions of the book. It gives specimens of most of them which are decidedly curious, and are doubtless intended to be reprints literatim, which unfortunately they are not—quite. There are brief but sufficient notes, and an alphabetical index. The volume is even prettier than James's edition of 1897. Neither is equal to Lord Preston's of 1695, which, if one likes the grandiloquence of that generation, is the most agreeable English presentation of a book that affords food for various reflections.

—The Clarendon Press edition of Burnet's 'History of My Own Time,' issued under the care of Dr. Osmund Airy (New York: Henry Frowde), is already known through the excellent first volume, which brought the reign of Charles II. down to 1673. The second volume, which now appears after an interval of three years, carries on the Bishop's narrative to the accession of James II., and finishes one stage of the undertaking. For the convenience of those who wish to buy only this section of the work, a full analytical index is provided of the part that ends with the death of Charles. As a piece of printing, the edition is very beautiful. Dr. Airy's comments are learned and careful. The need of good notes is especially great in the case of a writer like Burnet, who entered into political life and had strong prepossessions about persons. The notes are of two classes: the first deals with the state of the MS., and the second contains matter of elucidation. Burnet made a considerable number of changes in language, etc., when he revised his composition, and his manner of work is at least partly reflected in the textual notes. For historical side-lights and corrections Dr. Airy has used not only the State papers, memoirs, and other writers contemporary with Burnet, but the most recently published monographs. Here is an example of the rapidity with which material accumulates. Dr. Airy states that "since the whole of the notes were in type, the Montagu papers have been edited by the Historical Manuscripts Commission, and that Miss Foxcroft has published her laborious and very exhaustive work upon Halifax. I name only two out of many fresh sources of information which have seen the light during the progress of the book through the press." A glance at the note (p. 20) on the marriage of the Duke of York with Maria D'Este will show the reader what pains Dr. Airy has bestowed upon his task. Here and at numerous other points he displays full command of recent Continental studies in the field which Burnet traverses. It is not likely that the Bishop of Sarum will require another editor in our day.

LANG'S HISTORY OF SCOTLAND.

A History of Scotland from the Roman Occupation. By Andrew Lang. In two volumes. Vol. I. With a frontispiece. Dodd, Mead & Co. 1900.

A good history of Scotland has for some time been needed. Tytler's, published more than sixty years ago, has been long out of date, and although it is a creditable piece of work, written with judgment and fairness, it is deficient in force and pictorial skill. John Hill Burton's book, now some thirty years old, marked an advance, and showed a considerable mastery of the post-mediæval sources. But the style and manner were not quite equal to the theme, nor were the salient features of the historical development of the nation brought out with adequate breadth and clearness of view. Mr. E. W. Robertson and Mr. W. F. Skene did much for the very obscure early period, of which they possessed an altogether exceptional knowledge, and have rendered the task of their successors much easier. More recently Dr. Hume Brown has written an excellent book coming down to the accession of Queen Mary. But the field was still open for a comprehensive treatment of the whole subject which should be on the one hand thoroughly critical as regards the earlier days of obscurity, and on the other hand broad and impartial as regards that period, covering the sixteenth and seventeenth centuries, in which Scotland plays a considerable part in general European history, and which has given rise to so many passionate controversies involved not only with religious feeling, but with predilections for or aversions to figures like those of Queen Mary and John Knox, the later Stuart Kings and the Covenanters—dramatic figures, who excited a sympathy in their own time which has not died out of the Scottish mind.

Does Mr. Lang's book promise to fill the void and take rank as likely to be, for some time to come, the standard book on Scottish history? One can speak but tentatively, for we have before us only the first volume, which carries the story down from the beginning of things to the early days of the Reformation, when the murder of Cardinal Beaton in 1546 opened the long religious conflict which virtually ended with the battle of Killiecrankie in 1689. Mr. Lang has many qualifications for his enterprise. He is, to begin with, a Scot, yet a Scot who has lived long enough outside Scotland to have got rid of the narrower forms of Scottish patriotism. He is a skilful and practised writer, with much grace of style, though, as an acute critic has remarked, his sentences are better than his paragraphs. He is fortunate in possessing a strong taste for archæology and a complete mastery of folklore, gifts very helpful in dealing with the obscure early periods. He is industrious, generally accurate, and entirely abreast of the modern methods of historical criticism. With these gifts, and having evidently spent time and pains upon the historical sources, it was to be expected that he should produce a book of real merit. This he has done. This history promises, if it goes on as it has begun, to be on the whole the best account of Scottish affairs that has yet appeared. It honestly grapples with, if it does not always solve, the problems that are due to the deplorable paucity and brevity of the authorities for nearly all the earlier, and parts even of the later, periods. It shows an interest in the Celtic as well as the Angle or Saxon part of the Scottish nation which has been wanting in some Scotch historians, and it fairly assigns to each element its share in the building up of a Scottish people out of very diverse races. It does justice, but not more than justice, to the two national heroes of the war of independence, without attempting to decry the merits or to deny the case, such as it was, of their English antagonists. It is written with spirit throughout; wit is not wanting; and some of the descriptive passages, such as that of the fight of Flodden Field, are full of color and power, while the chapters on economic, social, and constitutional matters show real insight and grasp. They prove that though Mr. Lang may have become best known as a littérateur, he has the capacities of an historian.

The only defects which it seems necessary to note are the habit into which he sometimes falls, though it is one which a diligent student of Homer might have been expected to avoid, of occasionally telling a story by allusion rather than in a direct, straightforward way, and the tendency to let the broad results of a series or group of events become obscured by the multiplicity of details. He is so conscientious in giving the details, often in themselves tedious or perplexing, of a string of quarrels or intrigues, that we see only the details, and fail to catch a broad general impression of the trend of things, and the general result that emerged. This is especially the case in the two very tangled reigns of David the Second and James the Fifth, when the perfidies and tergiversations of the Scottish nobles attained their highly repellent maximum. More selfish or more treacherous leaders no country ever had; and Mr. Lang is not too strong in his denunciations of their conduct. It is certainly difficult to convey a clear impression of the main stream of events in such a period; yet we feel that more might have been achieved in this way than the book achieves. There is also another danger which Mr. Lang has to avoid. He evidently desires to do justice all around, and is (on the whole) commendably free from partisanship; but in his references to the Scottish reformers of the sixteenth century, and in particular to John Knox, there is a note of acridity, not so much in the substance of what is said as in the manner of saying it, which will expose him to the suspicion of partisan feeling. It is natural that the violence of the contemporary assailants of the old Church, and the unfairness of some of its most recent enemies, should drive him the other way. He is, for instance, well justified in his exposure of Mr. Froude's constant misrepresentations. That best known of recent British writers on the Reformation period might almost seem to have been born with a natural aversion to truth, an aversion sedulously cultivated during a long literary career. But the reign of Queen Mary, with which the second volume of this History will deal, has been a field for such embittered controversy that any one who touches it had better avoid the kind of tone which characterizes Mr. Lang's anticipatory references, in various parts of the first volume, to the Presbyterian reformers of the sixteenth century. Such faults as they committed can be just as effectively set forth and reprobated in a less biting and provocative fashion than that which Mr. Lang employs.

There is, in our author's treatment of his subject, perhaps not quite enough reference to the contemporary history of the rest of Europe, though it is no doubt true that down till the reign of James the Fourth Scotland stood rather out of the general stream of that history, and had few international relations except with France. There is also less use made than might have been expected of the physical structure of Scotland as a determining factor in the growth of the nation, and in those wars, foreign or intestine, which fill so large a part of her annals. There are some instances of carelessness, such as "Pont de Garde" for "Pont du Gard," "Egil Skallagrim," for "Egil, son of Skallagrim." But we forbear to dwell on such omissions or these small inaccuracies lest we should appear to disparage what is, take it all in all, a valuable and interesting piece of work, which throws much new light upon its subject, and contains many fine and striking passages.

No country in Europe has had a more romantic history than Scotland. No country has, in proportion to its population, produced a greater number of remarkable men, or contributed more to the general progress of letters, science, and abstract thought in the modern world. Yet no country of Western or Central Europe was, during the Middle Ages, more backward in what is called civilization. Scotland stood at the beginning of the sixteenth century much where England and France had stood at the beginning of the thirteenth. She was a prey to frightful disorders. The Celtic Highlands were, and remained for two centuries longer, under their primitive clan-system. The lowlands were hardly in better case, so far as law and order was concerned, for the nobles carried on almost incessant wars with one another or against the King. It was not till near the middle of the sixteenth century that James the Fifth created a regular system of central judicature, such as had been created for England by Henry the Second nearly 400 years before. The lines of the political Constitution were still unsettled, if indeed one can talk of a political constitution where war and violence were the rule. The people were poor and rude, speaking a form of English very unlike that of their Southern neighbors, and possessing few of the comforts, scarcely any of the luxuries of life. No doubt the nation already abounded with literary talent, and had begun to produce poets of distinction. But it was the struggles of the Reformation that were to give a definite form to that peculiar character by which it has asserted itself in the modern world, and retains, even after two centuries of union with its immensely larger and wealthier partner of the South, so much that is distinctive, so much that is interesting to the visitor from abroad. Already the long resistance to England from the days of Wallace downwards had braced up the spirit of the people, and united, all over the Lowlands, the dissimilar Celtic and Saxon elements into one nation. The long strife with Rome and Episcopacy, which filled the reigns of the last four Stuarts, was to complete the work. We trust that before many months Mr. Lang will give us his narrative of this period, which will test his powers even more fully than the difficult task which he has now accomplished of describing the birth and youth of the Scottish people.

Four Months Besieged: The Story of Ladysmith. By H. H. S. Pearse, the *Daily News* (London) Special Correspondent. With maps, and illustrations from sketches and photographs by the Author. The Macmillan Co. Crown 8vo, pp. xiv, 244.

This volume sustains the well-established reputation of the war correspondence of the *Daily News*, though it is not a compilation of letters published in that journal. Mr. Pearse, the special correspondent, kept careful current notes of events during the siege of Ladysmith, and wrote letters which miscarried, were suppressed by the censorship, or were belated, so that a valuable fund of original matter is here edited from his copies. He is a veteran in years as well as in service, who had two sons serving in the volunteers of General Buller's column. The father in the beleaguered town and the sons fighting with the relieving army lend a romantic interest to the story. The tone of experienced judgment in the book is warranted by the age and preparation of the writer, and quickly wins our confidence.

The little town of Ladysmith was a natural growth in the progress of South African colonization. It was the trading centre for the colonists of North Natal, where the road from Durban, the principal port on the Indian Ocean, to Johannesburg and Pretoria, approaches the Drachensberg range and throws off a westward branch towards Kroonstad and the centre of the Orange Free State. In such a broken country the watercourses are the natural lines of travel, and their valleys the desirable regions for settlement. The roads, therefore, follow the streams, and at the heads of the valleys cut by their erosion are found the passes in the mountains. Ladysmith lies in a fork of the Klip River, a tributary of the Tugela, and the branches of the Klip mark the north and west roads over the mountains. When the railroad was built, it naturally followed the easy grades of the wagon road, and Ladysmith was also at its junction. Thus the town became the base for a couple of military posts near the mountain passes; stores and munitions of war accumulated, its garrison was large, and it was regarded by Natal colonists as their protection from northern invasion.

This would have been true enough in a war of moderate proportions; but when the Transvaal and the Orange Free State united in a Landsturm against the British States, the proportions were not moderate. England needed time to collect a large army in South Africa, and the Boers did not mean to give it to her. They declared war in the hope of capturing all the British forces in South Africa before the large army could arrive. They organized two columns of invasion, one to operate against Natal on the east, the other against Cape Colony on the west. As they lived on horseback, they were an army of mounted riflemen with a small corps of well-trained artillery. But their two columns must operate independently, some four hundred miles apart. The circumstances indicated the true strategy for the British to be a stubborn resistance on one line by a comparatively small but active force, and a concentration on the other of the bulk of their army to crush the enemy—in short, to follow the plan which Lord Roberts adopted when he reached the theatre of war. This implies the probability that the weaker column may be forced back, and the region which suffers from this will cry out. Such discontent may become politically dangerous, and it is a question of statesmanship rather than of military art to decide between risks at such a juncture. It appears that the political officers of the Natal colony thought it imperative to hold Ladysmith, and the generals on the ground, White and Symons, either agreed with this or yielded their military judgment to the political one. Symons was killed in the first engagement, and White was surrounded at Ladysmith by the end of October.

Mr. Pearse was evidently of the opinion, at the time, that it was possible for Gen. White greatly to have delayed the investment and prolonged his control of the railway, by a more vigorous use of his forces. Ladysmith is not a fortress; it is only a position—an open village with considerable camps among the hills around it. The situation had a resemblance to that of Atlanta in our civil war. The attacking army was not big enough to march around that city at once, and the defenders, by extending their own works by the flank, delayed and prevented the complete investment, covered the railway behind them, and, after a month, slipped away to a new position in the rear. Could not Gen. White have done this at Ladysmith? If he had preserved his communications for even half a month, Buller would have joined him with the relieving column, making the army largely superior to the Boers. Time was evidently the essence of the problem, for the Boers do not seem to have greatly outnumbered White. A very vigorous defensive was in order, not by sending detachments out to attack the enemy by way of sortie, but by occupying connected positions in front of the town and making the Boers attack.

Once the place was invested, the patient stubbornness of defence is very warmly, but none too warmly, praised by Mr. Pearse. There was no thought of surrender, there was invincible determination not to yield a foot; there were several brilliant night attacks on the Boers' big guns, permanently disabling two of them. The growing scarcity of food was willingly borne, as was the disease which followed on the heels of partial starvation. The townspeople were hardly less brave than the soldiers. The exposure and the want were shared by both. Women and children became accustomed to the ordinary fire of the great guns, and went about their houses and through the streets in apparent indifference to the danger, seeking bombproof shelter only when the cannonade was most rapid and continuous.

The story of four months of this wearing and nerve-depressing life under fire is told in Mr. Pearse's journal, with circumstantial details which make the experience live before us. At nightfall on the last day of February, Buller's advance-guard of cavalry dashes into the town, and their welcome by soldiers and citizens, with cheers and with weeping, is made half hysterical by the reaction from the long nervous tension, the lack of food, and the widespread influence of fever. The deaths in battle and from wounds had not been very numerous; indeed, one of the curious lessons of the siege is the wonderful range and accuracy of aim of rifled cannon throwing hundredweight shells four or five miles, and the merely trifling mischief they do when reasonable precautions are taken not to expose men in masses or in large visible groups. The moral effects of ceaseless watching, constant danger, and unwholesome conditions would seem to be more destructive than the most active field fighting.

Mr. Pearse's excellent photographs form a connected panorama of the whole circuit of the town. The important features of the landscape are noted, and the pictures thus become a great help to the study of the situation.

Early Connecticut Houses: An Historical and Architectural Study. By Norman M. Isham, A.M., Architect, and Albert F. Brown, Architect. Providence, R. I.: The Preston & Rounds Co. 1900.

Four years ago there was reviewed in these columns the book entitled 'Early Rhode Island Houses,' the work of the same authors as the present one, which is in size and style nearly a sister book, but a little larger; and although there are minor differences in the way in which the subject is presented, they hardly call for detailed comment. There is again a completeness of record, a successful attempt to tell the whole story as far as it is important it should be told, upon which it is hard to comment in terms too favorable. Five seventeenth-century houses in Farmington, three in Hartford, one in Windsor, one in Berlin, and one in South Glastonbury are treated in chapters ii. and iii. The houses of the same epoch in "the New Haven colony" are two in New Haven, two in Branford, one in Guilford, one in Milford, and one in Southold; and these are treated in chapters v. and vi. Then there is a third geographical division of the subject, and it appears in chapter viii. that there is at least one seventeenth-century house in New London. The houses of the eighteenth century, not more numerous, are treated in chapters iv., vii., and viii. Each house is presented in a small, carefully made drawing, mainly in outline, without the slightest attempt at artistic effect; and the more artistic on that account, as revealing the work of architectural art without the interference of the draughtsman's fancies. It is clear that these little drawings of effect (stated to have been made with the aid of photographs) and the plans and explanatory sections are as trustworthy as it is possible to make drawings of the kind. Even if in any one case it should appear that something conjectural has been assumed rather too boldly, or that some indication has been misunderstood, the book would still be accurate and worthy of confidence far beyond the wont of archæological research.

As for the help which the authors have here given to the architectural student, the value of that depends so very largely upon the student himself, and his habits and bringing-up, that nothing absolute can be said of it. Fifteen years ago, when that interesting renascence in American frame houses was in its full glory, and when the clapboarded and shingled dwelling was the study and the delight of some of the most able and painstaking of our architects, these books would have been invaluable. With us in America, everything architectural goes by fashions, as offensively as does female costume, and at present the surface indications are that no one cares any longer for the naturally developed American wooden house. Without being sanguine, however, it may be assumed that the disappearance of interest in that single natural piece of American artistic evolution is not as complete as one feels or says in his despair; and so, as we recommended the book of four years ago, we recommend this one now to every person who cares about genuine tradition in fine art. And let us remember that tradition is the life and soul of fine art. No less an authority than John La Farge, and in no less careful writing than his 'Letters from Japan,' has told us that—and in good time, for there were critics who began to doubt whether tradition, which had managed to let itself be forgotten, could be of much avail. The tradition is as good as ever, and without it there is no safety. It is the restless and impatient spirit of the time, which, beginning with 1830, has created the art of autovivisection, and thereby replaced the somewhat nobler art of creation.

In the notice of the 'Rhode Island Houses,' attention was called to the drawings of the details of framing in solid timber, showing the systems of shaping uprights and horizontals, and of applying to these such simple decoration as notchings and stop-chamfers could supply. It was pointed out that, as it was stated in the authors' text, so was it evident from their drawings, that the earlier work of the New England carpenters was as strictly traditional, and that in the best sense—as completely Elizabethan or at least Jacobean in its significance—as if the workmen had never left the island of Great Britain. The same thing has to be said about these detail drawings from the Connecticut villages; and in this instance, at least, the authors have given to the reader for his satisfaction, and that he may himself use comparisons which will not be odious, drawings from such venerable English houses as Stokesay Gate House and Moreton Old Hall, and from half a dozen Jacobean houses besides. In connection with this the reader might study the interesting note on page 236, which consists chiefly of a letter from the author of the recent admirable 'History of Renaissance Architecture in England,' Reginald Blomfield.

If we could have another revival of interest in the native American wood-framed houses, perhaps the revivalists might be led to study solid timber a little more carefully. The carpenter of the present age is supposed to abhor solid timber. It is a tradition thirty years old that the house carpenter thinks himself above it, and jobs out all the handling of heavy sticks to the framer; but the framer has no idea of cutting, shaping, trimming, chamfering, treating architecturally the scantling which he tosses about. He looks upon that as joists, studs, and girders, and knows no architectural drawings but small-scale framing plans. Therefore, it will require some little patience and a great deal of enthusiasm on the part of the designer to get his solid woodwork properly done; but it is so well worth doing, and the result would be so delightful to everybody who cares for architecture, that the hope cannot quite die in the mind of the enthusiast. If the reader frequents exhibits of architectural drawings, or even if he takes one or another of our periodicals devoted to that subject, he will remember the long array of designs based upon English half-timbered country houses, and he will remember that it is often pointed out by contemporary writers on the subject that these modern buildings are nearly always fakes, nearly always mere simulacra of timber frame construction. Nearly always are they simply wooden houses of the common type, covered with smooth boarding and then "adorned" by a copy in thin boards of the skeleton of timber which the old English house displays. Now, it cannot be supposed that any architect who has designed such a thing approves of it or likes to be reminded of what he has been doing. One who has such an artistic conscience as that which we have here supposed common to the profession, would be glad of the chance, it is to be presumed, to do the thing in reality.

Life Beyond Death. By Minot J. Savage, D.D. (Harvard). G. P. Putnam's Sons. 1899.

Dr. Savage's old-fashioned title-page gives ample intimation of the contents and purpose of his book: "A Review of the world's beliefs on the subject [of Life Beyond Death], a consideration of present conditions of thought and feeling, leading to the question as to whether it can be demonstrated as a fact; to which is added an appendix containing some hints as to personal experiences and opinions." It is easy to understand the popular impression made by Dr. Savage as one reads these pages. They are singularly persuasive in their manner. One text might have answered for the whole collection: "Come and let us reason together." At every stage we have the effect of a man thinking *with* his hearers and not *for* them. One cannot but admire the daring of the preacher venturing to treat such subjects with no manuscript before him, while at the same time the disadvantages of such a method appear from time to time in forms of expression which leave something to desire, as being loosely framed or defective in some sort.

The dedication is a letter to Philip Henry Savage, Dr. Savage's son, the promising poet and librarian who was cut off untimely June 4, 1899. It is almost too tender for the public eye, but it gives a note of deeper and more touching significance to those portions of the book which deal with Dr. Savage's personal confidence in the spiritualistic argument for a future life. That his preface is concerned with this, and his appendix, and the last four chapters of the book, makes it plain that we are to look to this matter for the book's dominant inspiration. Those chapters which treat historically the beliefs of mankind touching a future life are necessarily too brief for any fulness of detail. It is a virtue of the first chapter, "Primitive Ideas," that it reflects the uncertainty of investigation in this quarter hitherto. Dr. Savage makes no concealment of the fact that a future life was generally, in the early stages of belief, something dreaded rather than something desired. Where he is dealing with the Old Testament teaching, he finds the dawning of a hope of deliverance from Sheol where a correct translation and exegesis admit no such construction; and, coming to the New Testament, his Pauline Universalism is not borne out by so competent a scholar as Prof. Cone, himself a Universalist.

The chapter called "The Agnostic Reaction" is full of generous appreciation of the doubters and deniers of our time, but is the following a true account of the agnostic party? "They simply reject, and are rejoiced that the evidence does not compel them to accept, the things that are inherited from the hideous barbarism of man half-way out of the animal—that is all." On the contrary, your genuine agnostic is as unable to affirm a good God and a good future as the worst yet conceived. Chapter ix., "The Spiritualistic Reaction," represents spiritualism, the doctrine of intermundane communication, as a reaction from Agnosticism. Shall we not keep closer to the facts if we say that spiritualism in this sense achieved its most notable popular victories *pari passu* with the agnostic and the materialistic advance? That there has been of late years a spiritualistic reaction there can be no doubt, but its spiritualism has been that of science and philosophy jointly discovering the insufficiency of matter as a final term. It has been that of the Neo-Kantians and Neo-Hegelians making their damaging criticism on that Spencerian philosophy which Dr. Savage esteems so highly. But the Spiritualists, with a capital letter, will not be satisfied with Dr. Savage's relation to them and their opinions. He declines being called a Spiritualist because there is so much in popular spiritualism of which he disapproves. He admits a preponderance of fraud in slate-writing and other manifestations. He sets down all materialization as fraudulent. Nevertheless he is persuaded that we have enough evidence to convince us of the truth of Spiritualism "as a provisional hypothesis."

The Society for Psychical Research has a chapter to itself, and Dr. Savage is convinced, with Prof. William James and others, that there are phenomena which point unmistakably to the action of extra-human intelligence. We get, however, from him an impression of more ample evidence than that of Professor James's "one white crow," Mrs. Piper, that all "psychics" are not black. In the appendix he takes us into his confidence in a most frank and simple fashion. Clearly his investigations have been very careful and severe, though it might not be difficult to imagine a temper yet more sternly scientific. And they are significant of a circle of phenomena which, if they do not prove another life, prove occult elements in this of marvellous depth, and very great importance.

English Political Philosophy, from Hobbes to Maine. By William Graham. London: Edward Arnold. 1899.

First Principles in Politics. By William Samuel Lilly. G. P. Putnam's Sons. 1899.

The design of Prof. Graham's book is good. No country, except Athens, has produced so much political thinking of a high order as England. The writers selected for examination—Hobbes, Locke, Burke, Bentham, Mill, and Maine—were great men, whose influence on thought and on civilization well deserves to be estimated. The method adopted by Prof. Graham is to treat the chief writings of each of these philosophers analytically, supplying at the same time criticism and comment. He also attempts "to distinguish what is permanently true from what is doubtful or erroneous, to disengage the former, and, as far as may be, develop it further, with the hope that finally, from the exposition and criticism together, something like an Introduction to Political Science might result, resting on authority and reason combined." So far as exposition is concerned, a reasonable degree of success is attained. The arguments of the writers are carefully condensed and summarized, and the most important and typical views are given by quotation. The comment is occasionally helpful, but it is unavoidably tedious. We may save time, but it is at the sacrifice of pleasure; and it is doubtful if any one competent to appreciate the criticism would not do better to consult the originals for himself.

In his attempt to distinguish false from true, and to give some finality to political speculation, Prof. Graham undertakes a task requiring very exceptional powers, and one in which failure involves no reproach. Why we consider his attempt unsuccessful we can show most briefly by illustration. He reviews Burke's writings, and we are bound to say with the greatest care and with excellent judgment. Then he proceeds "to pronounce a final opinion on Burke's theory of things." He finds

> "a system of opinions that rejects the possibility of discovery in moral or political philosophy; that forbids honest inquiry on religious questions that might appear to lead further than its own conclusions; a mental temperament that would make a difference of speculative dogma in religion or politics a ground of a prolonged war with a neighboring nation, and one that is even out of sympathy with the new economical doctrines and the great new developments in manufactures and trade. . . . We find a system of politics that rests property mainly on prescription, whatever injustices and abuses may be connected with it, as in the case of the feudal burdens and dues in France; that rests government as well as property on prescription, and that accordingly approves of an irresponsible and corrupt oligarchy governing England. . . . We find a view of morals that rests right conduct on opinions, manners, habits, as external objective guides, or else on prejudice and mere strong feeling as internal instructors, instead of on conscience, reason, utility. . . . This stamp of mind that dislikes all change, at the Reformation would have condemned it, and would have been on the side of Philip II.; at the rise of Christianity, with the persecuting Emperors."

So much for Burke. Now if we refer to Prof. Graham's criticism of Locke's views on Toleration, we find him defending the persecution of the Christians as a political necessity; and as to Philip's policy of extirpating heresy by slaughtering the Netherlanders, Prof. Graham blandly observes that history will justify him in making the attempt. When he examines Mill's philosophy, he takes the position that, except in the field of invention, little more progress remains to be made by mankind. "Science is nearly completed, art in all its branches has probably already reached its highest culmination." We shall not get much further than Spinoza, Kant, or Hegel; but, perhaps, the social organization "can be somewhat improved." Prof. Graham's complacency exceeds that of Burke, and we cannot but deplore the lot of Newton in living when he did. Had he possessed our modern wisdom, instead of blindly thinking he was picking up a few pebbles on the boundless ocean of truth, he would have discovered that what confronted him was but a small pond, the opposite shore of which was in plain sight.

Mr. Lilly is a dogmatist. He dislikes the Utilitarians, and holds to Natural Right. He maintains that right and wrong in their nature are what they are from everlasting to everlasting, and are unchangeable even by the fiat of Omnipotence. At the same time he insists that reason is the characteristic endowment of man, that it is separated by a whole universe from instinct, and that the capacity for ethical development is possessed by the human race alone. Furthermore, Mr. Lilly declares that the State is not only an organism, but a person. It is also a superior person; "the rights of the organic whole come before the rights of any constituent part." Sadly enough, this superior person occasionally sins; but it seems rather presumptuous for beings of a lower order to venture on such criticism. Lèse-majesté is really flat blasphemy. Mere mortals should not define the duties of superior beings; especially since these beings either do not possess the faculty of speech, or disdain to use it in silencing human impertinence. While we cannot adopt Mr. Lilly's political metaphysics, we must do him the justice of saying that he is a vigorous writer, and that many of his observations on social questions are acute and suggestive.

Bird Studies with a Camera. With Introductory Chapters on the Outfit and Methods of the Bird Photographer. By Frank M. Chapman, Assistant Curator of Vertebrate Zoölogy in the American Museum of Natural History, etc. With over one hundred photographs from nature, by the author. D. Appleton & Co. 1900. 12mo, pp. viii, 218.

The utility of the camera as an aid in nature study is vividly demonstrated in 'Bird Studies'—a most charmingly written book, as well as a very important contribution to ornithology. The author happily combines scientific exactness with the keen insight and sympathetic touch of the born bird-lover, and ranks not only as an ornithologist of high standing in the technicalities of his science, but as one of our best popular writers on birds. He has had exceptionally wide experience in field work, and is easily the leading expert with the camera in its relation to bird life. To make the way easier for others who may wish to enter this fascinating field of both research and pleasure, about forty pages are devoted to instructions to the would-be bird photographer in reference to his outfit and methods of work, based on long experience in the use of the camera, and giving doubtless the best and fullest instructions regarding the technique of the subject ever presented to the public. The remaining 150 pages, with their 100 reproductions of the author's photographs, afford abundant incentive to effort on the part of beginners in this delightful field, and sufficient evidence of the success that has rewarded his own patient endeavors.

Photography, although so fascinating, is not merely a pastime, but, as our author well says, an invaluable substitute for any amount of description. In recording the character of a bird's haunts, its nesting site, nest, eggs, the appearance and development of its young, the camera is so far ahead of the pen in its power of graphic representation that it is a waste of time to use the latter when circumstances permit the utilization of the former. A photograph of a marsh or wood showing the favorite haunts of a species is worth more than pages of description. A picture of a bird's nesting site conveys a better idea of the situation than words can possibly give, while in place of vague phrases descriptive of a nest, we have a faithful delineation of the nest itself, etc. Especially is the camera to be prized as furnishing an indisputable register of conditions that are rapidly passing away, as in the case of the few large bird colonies still existing. We know that the Great Auk found one of its last resorts at Funk Island, where was once a prosperous colony; and how important an addition to this bird's history, Mr. Chapman asks, would be a series of photographs taken of this bird as it formerly existed on this island! The wild pigeon, less than a century ago, was so abundant as at times to darken the sun with its passing millions, but there was then no camera to record these flights and supply evidence of facts that now seem amost beyond belief. And such instances are innumerable.

Mr. Chapman's work consists of a series of chapters each focussed, as it were, on some particular species, or on some locality of special interest to the bird student; as for example, "The Chicadee, a Study in Black and White," with its eight pictures of old and young chicadee life, and accompanying text telling of the trials and patience required to secure the pictures, and giving us a hitherto unwritten chicadee biography. The chapter on the Least Bittern, with its six illustrations, is a revelation even to the ornithologist regarding this little known recluse. That entitled "Two Herons" tells of the housekeeping affairs of a large colony of night herons or quawks on Long Island, and of the haunts of the Great Blue Heron in Cayuga County, New York; in both cases the telephoto lens had to be used in securing the pictures here shown. "Where Swallows Roost" is a tale of the Hackensack marshes, where marsh mallows and wild rice are effectively in evidence as well as swallows. "Two Days with the Terns" recounts briefly the sad history of the all but annihilation of these lovely sea birds along our coast, and exhibits to the eye the various stages of growth of the young and the graceful form and pose of the old birds, as studied at Great Gull Island, New York, and on the Weepeekets in Buzzard's Bay. "The Bird Rocks of the Gulf of St. Lawrence" deals with the great colonies of sea birds—gannets, gulls, guillemots, and petrels, or Mother Carey chickens—still in existence, though with greatly reduced population, on Percé Rock, the Bird Rocks, Bonaventure Island, and the Magdalens, with many views of the islands themselves, of the hardy fishermen, the lighthouse and light-keeper's home and family on Great Bird Rock, and of bird life in all its varied kinds and phases. "Life on Pelican Island, with Some Speculations on the Origin of Bird Migration" concludes the book. Pelican Island is a small islet off the east coast of Florida, where all the pelicans of the neighboring region find a nesting-place. Ten pictures, with the usual delightful narrative of personal experience and events in the pelican metropolis, serve to make very real this little-known resort of a bird that has of late been slaughtered with reckless hand to supply the long quills recently so much in vogue for women's hats.

Mr. Chapman has a few words to say on "the charm of photography," as well as on its utility as an aid in bird study, a portion of which we cannot resist transcribing, since it shows how the camera is replacing the gun, even with earnest bird students:

> "As a one-time sportsman, who yielded to none in his enjoyment of the chase, I can affirm that there is a fascination about the hunting of wild animals with a camera as far ahead of the pleasure to be derived from their pursuit with shotgun or rifle as the sport found in shooting quail is beyond that of breaking clay 'pigeons.' Continuing the comparison, from a sportsman's standpoint, hunting with a camera is the highest development of man's inherent love of the chase. The killing of a bird with a gun seems little short of murder after one has attempted to capture its image with a lens. The demands on the skill and patience of the bird photographer are endless, and his pleasure is intensified in proportion to the nature of the difficulties to be overcome, and in the event of success it is perpetuated by the infinitely more satisfactory results obtained. He does not rejoice over a bag of mutilated flesh and feathers, but in the possession of a trophy—an eloquent token of his prowess as a hunter, a talisman which holds the power of revivifying the circumstances attending its acquisition."

The Orchestra. By Ebenezer Prout. Edward Schuberth & Co.

Germany cannot claim a monopoly of the great musical theorists and writers of works on composition. Dr. Prout has written at least a dozen treatises on harmony, counterpoint, fugue, and musical form, and his books, while no less thorough than those of the Germans, are usually more practical and up to date. The crowning work of his series is now before us—two volumes on the orchestra—which, with the exception, perhaps, of Gevaert's treatise, may be pronounced the most useful extant on the subject for students, composers, and amateurs who wish to know more about the components of orchestral coloring than their ears unaided tell them. Dr. Prout has devoted eleven years to his task, having made a list of some 1,400 passages in the works of the masters of all schools. From these he selected the most pertinent, and made such free use of them that his two volumes contain more pages of illustrations than of reading-matter; whereat surely no student will growl. It will save him much trouble or expense, especially as many of the author's references are to the less familiar and accessible works of such fine colorists as Schubert and Mozart, Auber and Cherubini.

One might quarrel with the author for practically ignoring Bach and Handel, and beginning with Haydn and Mozart as the originators of modern orchestration; but, though Bach and Handel were great colorists in their way, some of their instruments differed from ours, so that Dr. Prout's procedure is justifiable, and we may agree with him that "the science of orchestration, as practised at the present time, is the most recently developed branch of music, being not much more than a century old." Its history has been well told by Henri Lavoix. Our author also points out that just as no sensible man would ever think of trying to paint a picture before he had thoroughly learned drawing and perspective, so it is quite useless for any one to attempt to write for orchestra before he has obtained a complete mastery of the other branches of composition. So far as the art of tone-coloring can be taught on paper, it is done in Dr. Prout's book; but, as he admits, "the feeling for orchestral coloring must be, like the invention of melody, a natural gift, and not the result of mere calculation. . . . Further, just as every great painter has his own peculiar style of coloring, each great composer has his own method of scoring; and it would be no more possible for an experienced musician to mistake a score of Mozart for one of Wagner than it would for an art-connoisseur to mistake a painting by Titian for one by J. W. Turner." As a poet may torture his brain days or weeks for the right word to express his thought, so a composer may hunt a long time till he finds in his mind the proper instrumental coloring for the musical idea and mood he has in view. A great composer can call to his mind's ear peculiar tone colors as a poet or novelist can particular scenes to his mind's eye.

A Novel of the American Colony in Paris.

A New Race Diplomatist.

By JENNIE BULLARD WATERBURY. With five Illustrations by Edouard Cucuel. 12mo, cloth, $1.50.

J. B. LIPPINCOTT COMPANY, Publishers,
PHILADELPHIA.

Reading Case for the Nation,

To receive the current numbers in a convenient (temporary) form. Substantially made, bound in cloth, with *The Nation* stamped on the side in gold. Holds about one volume. Papers easily and neatly adjusted. Sent, postpaid, on receipt of 75 cents.

The Nation.

NEW YORK, THURSDAY, JULY 12, 1900.

The Week.

The condition of the national finances as revealed in the annual balance sheet is extremely gratifying, showing a surplus of $81,229,777. Secretary Gage, in his last annual report, estimated the surplus at the end of the fiscal year 1900 at $40,000,000. The total receipts, exclusive of the postal service, are $568,988,948, and the expenditures $487,759,171. This showing will make the demand for a reduction of taxes imperative. With the gradual reduction of the expenses in the Philippines, the surplus of the year 1901 should be more than $100,000,000, provided we do not get into any new wars.

Representative Grosvenor of Ohio has explained that we have taken charge of the Philippine Islands for the money to be made out of them, and it is time to ascertain how our investment is turning out. The field was not a particularly promising one. Up to June 30, 1898, the value of our annual exports had seldom exceeded $150,000, if we may trust the Treasury Bureau of Statistics, but in the following year this value rose to $400,000, and in the eleven months ending May, 1900, it was $2,386,333. These figures may be compared with those given by the War Department concerning the imports at Manila during the calendar year 1899. The value of these imports is returned at $17,450,000, of which $1,330,350 represents the value of imports from the United States; about one-thirteenth of the total. If both sets of figures are accurate, it would appear that the imports at this port are about one-half of the total imports into the Philippine Islands, although we cannot tell how large a part of these imports is furnished by foreign countries, except in the case of the port of Manila. We may reasonably assume that the value of our exports to the Philippine Islands will not fall much short of $3,000,000, when the returns for the year are completed. The magnitude of these figures is not impressive, especially when we compare them with the figures for the rest of our export trade. That amounted to $1,400,000,000, of which the Manila trade would be somewhat more than one-fifth of one per cent. If we estimate the profit on this trade at ten per cent., it would amount to $300,000, or about one and one-half per cent. on the $20,000,000 which we paid for the islands. It would be a very moderate estimate of the total cost of this piece of property to put it at $300,000,000. If it has not cost us that already, it soon will have. We may, therefore, consider that the present return on our speculation is about one-tenth of one per cent. If we call our gains on our total exports $140,000,000, or ten per cent. of their value, we find that the whole of it is swallowed in the expenses of obtaining a trade from which we gain $300,000 a year.

We have to bear in mind that we are maintaining a great many thousand American soldiers in the Philippine Islands, and that the growth of our export may be due to their demands, and not to those of our new subjects. Such a growth of exports, it is hardly necessary to say, is abnormal and prejudicial. The more we have of such trade, the poorer we shall grow. We are willing to concede that in certain articles there is some evidence that we are building up a trade with the natives of these islands. We might have expected to increase our exports of agricultural implements, and we have done so. Year before last the value of these exports was $50; but this year it has risen to the great figure of $225. In cotton cloths, we have increased our exports till their value has reached nearly $14,000, and we sell nearly $10,000 worth of clothing and all other cotton manufactures. Our export of boots and shoes amount to $6,440; of leather and manufactures thereof, to $3,220; of mineral oils, to $7,921. Dairy products were shipped to the value of $1,904; and cheese to the value of $3,594. We also disposed of about $8,000 worth of furniture; and if we were giving the figures for a small interior town, instead of a great empire, we might say that we were doing a brisk business, in spite of the fact that the value of several articles exported has decreased. If, now, we turn to the articles required for the support of our troops and officers of all kinds, the explanation of our enlarged exports stares us in the face. We find no increase in the exports of cattle, or hogs, or sheep; but exports of horses have risen from *nil* to $211,550, and of course hay and grain are exported to feed them. Manufactures of tobacco increase from $795 to $12,493; coal from $70,000 to $143,000; fruits and nuts from $3,869 to $26,117; electric and other technical apparatus from $3,000 to $12,213; hams from $4,840 to $7,417; lard from $2,155 to $6,786. The greatest development of all is probably in the exports of alcoholic drinks; but the figures for this trade are not furnished for this year.

It is well known that the present head of the Treasury Bureau of Statistics is preparing the campaign text-book of the Republican party. Such a scandalous disregard of the proper duties and dignity of that bureau has never before been shown. There have been charges made of partisan use in the past, but these charges have never been proved to such an extent as to impugn the correctness of the returns issued by the Bureau. There have been issued, under official sanction, interpretations of commercial and industrial returns, favoring a particular policy or measure; and when Charles Foster was Secretary of the Treasury, the head of the Bureau permitted a violently protectionist interview to be circulated as a Treasury document, although it was well known at the time that the matter had been prepared by another hand. Such exhibitions of improper political activity by the Bureau have been rare, however, and have never failed to bring down criticism on those who were responsible. Certainly the conduct of the Bureau by such men as Gen. Walker and Mr. W. C. Ford did much to win the confidence of those who used the returns, and to attract favorable comment in foreign countries, where the same detailed and extensive system had not been applied. Secretary Gage must bear the full responsibility of causing the present scandal. He removed a man of experience to make room for a political hack, whose only qualification was his service during the campaign in running a "literary bureau" for the Republicans.

Such absolute control of a great political organization by one man as Bryan exercised last week has never before been seen in this country. All authorities at Kansas City agree that a large majority of the delegates were opposed to having a 16-to-1 plank in the platform. A majority of the Committee on Resolutions went into the meeting on Wednesday evening determined not to allow such a deliverance, and this majority included the representatives of every Northern State east of the Mississippi which was carried for the Democrats in the "tidal wave" of 1892—Connecticut, New York, New Jersey, Indiana, Illinois, and Wisconsin, as well as Ohio, which was so close that Cleveland secured one of the electoral votes. Almost every leader of any consequence regarded a separate silver plank as fatal to the party's chances of success. In short, the conditions were such as apparently to assure the defeat of the scheme. But Bryan had made up his mind that there should be a 16-to-1 plank, as emphatic as language could make it; he made his influence felt in the committee-room, and the majority shifted to his side; and the same influence caused all opposition to his policy to die out among the mass of the delegates. The candidate thus forced his own issue upon a reluctant Convention by an exhibition of personal power which recalls the sway of Andrew Jackson, two generations ago.

Correspondents at Kansas City noted the absence of well-known men among the delegates to the Democratic Convention. With the exception of ex-Senator Hill of New York and Senator Jones of Arkansas, there were but few of those familiar figures whom one expects always to see on such an occasion—the men who have long been conspicuous as the leaders of their party in their various States, and who have attended its conventions so often that they are recognized wherever they appear. It is safe to say that never since the first national gathering of the party in 1832 has there been an assembly of those who were presumptively leading Democrats, which contained so few men who had ever been heard of outside their own towns. There were whole delegations which embraced hardly a person who had any standing in the organization half a dozen years ago. Doubtless one element in the great demonstrations over Hill was the satisfaction which the mass of delegates felt in having somebody whom they had ever heard of in the convention hall to shout over. Another, evidently, was their desire to rebuke Tammany, which is very unpopular in the South and West, for its discourtesy to Hill.

Croker has done his best to give Platt control of the State Government for the next two years. The course of the Tammany boss at Kansas City need not have been changed in the slightest degree if he had gone there with the deliberate purpose of rendering Democratic success in New York hopeless. His forcing of Van Wyck upon the Committee on Resolutions, in place of Hill, who was entitled to the place, was just what was needed to assure the triumph of the silver men, as it deprived the opposition of their strongest leader. His absurd selection of Keller as New York's candidate for Vice-President only emphasized the contemptible position which the Empire State occupied throughout the Convention. In order to assert his power, the Tammany boss consistently pursued a policy tending to certain defeat in this State. There were discreditable exhibitions of machine power in the Philadelphia Convention, but no national gathering of either party ever witnessed such a display of brute force exerted to satisfy personal grudges as Croker's performances at Kansas City.

It is easy enough to find incidents in the South which indicate that the relations between the races grow worse rather than better. Such a thing is the recent passage by the Mississippi Press Association of a resolution to expel the editors of all newspapers that employ *negroes as typesetters*. The only protest was made by a woman, who declared that the black man whom she employed did as good work as any white, and had as good a right to his job. This is certainly discouraging enough, as doubtless many of the editors who voted for this boycott along race lines have written articles complaining because the negroes do not learn trades. Happily, at almost the same time, another organization of white men was taking action toward abolishing the color line. Birmingham, the manufacturing city in Northern Alabama, has a Trades Council, organized several years ago, which has never admitted colored delegates to its meetings. There is another organization, the United Mine-Workers, to which members of both races belong. The Council recently asked the Mine-Workers to employ only union labor, but the colored members urged that it was grossly unjust to require them to give their work to white men when they were denied admission to trade unions and representation in the Council because they were black. The Council could not meet this argument, and did the only sensible thing by lifting the ban against colored delegates. Such action by carpenters, bricklayers, and other artisans renders the course of the editors the more discreditable by contrast.

The case of the Rumanian Jews, 175 in number, who have been refused permission to enter this country by the Commissioner of Immigration, presents features of peculiar hardship. It is stated that these unfortunate persons are the victims of persecution at the hands of the Government of Rumania, which has not only exiled them, but has provided them with passports forbidding them to return. They are thus prevented from going back there and from coming in here, and are suspended, like Mohammed's coffin, between heaven and earth. If it be true that they are not paupers, it will be not only cruel but illegal to drive them from our doors. Their cause is pleaded by men of responsibility, and it is impossible not to be affected by the statements made in their behalf. Their lives, it is said, "have heretofore been so miserable, and they have been caused to suffer and endure such hardships, that another disappointment, such as being denied entrance into the United States (pictured to them a heaven for the persecuted), may result in a number of suicides." Assuming the facts to be as represented, it is obvious that modern conditions require some extension of the restraints of international law. It must be recognized that if one State expels a citizen from its territory, it is the same as requiring some other State to admit him—a requirement which cannot be enforced, and which ought not to be attempted. The practice is similar to that which prevailed extensively in England, under the old poor-law, when every parish was actively engaged in "unloading" paupers on all the rest. It is not uncommon in this country for tramps and petty criminals to be passed along from town to town, although the practice is illegal and pernicious. We have passed far beyond the stage when outlawry or exile was permissible as a punishment, and the resort to it should be condemned as barbarous.

Belated evidence is pouring in that there were grave warnings of the China émeute that went unheeded. As long ago as last February the *North China Herald* declared that its information led it to fear that the spring would witness a rising such as foreigners had never seen in China. "The whole country, from the Yellow River to the Great Wall and beyond, will be a blaze of insurrection which . . . will drive every foreigner out of Pekin and Tientsin under conditions which it is not difficult to foresee." Yet more significant—absolutely startling in its exact forecast of what occurred—was a letter published in the same newspaper from its native correspondent in Pekin. This man said in the issue of the *North China Herald* of May 16: "I write in all seriousness and sincerity to inform you that there is a great secret scheme, having for its aim to crush all foreigners in China and wrest back the territories 'leased' to them." He went on to describe the persons, and factions, and military forces conspiring to this end, much as we now know them. All Chinese of the upper classes, he added, knew of the plot, and "those who count foreigners among their friends have warned them, but have, to my own knowledge, been laughed at for their pains." It seems to have been the same fatal contempt of the natives which lulled British officialdom to sleep on the crater of the Sepoy Mutiny.

There is a notion in some quarters that, when the disturbances in China are over, Japan can be compensated by a money indemnity for the services she is expected to render. Even if she were satisfied to accept such an indemnity, what likelihood is there that China could pay it? To meet the burden of debt imposed at the conclusion of the last war, she was forced not only to turn over to Europe the collection of her customs as security for interest on her bonds, but also to permit the foreigners to raise and dispose of a considerable portion of her *likin*, or provincial imposts on foreign goods. Later, to raise the supplementary indemnity which Russia forced Japan to accept in lieu of the coveted Liao-Tong Peninsula, China was obliged to pay for Russia's guarantee of the additional bonds by permitting her to deflect to the southward through Mantchuria the line of the trans-Siberian railway, and to occupy that province in order to build and protect the road. When the present disorders are over, there will certainly be heavy bills for damages that China will have to pay, in one way or another. Her potential revenue capacity is very great, but before she can pay heavy taxes her industries must be developed, and under Chinese methods of spoils government it is neither possible for taxes to reach the Treasury, nor for the resources of the country to increase. Even if the Mantchu Government survives the present crisis, the participation of Europeans in the administration of China will certainly be greater than before, and it is not unlikely that the ruling house will end by occupying a position like that long held by the Khedive of Egypt or the native princes in India under English rule—a figurehead behind which the real governing power may shelter itself.

Lord Salisbury's characteristically audacious address to the missionary meeting in London practically implied that the imprudence of missionaries in China was the cause of the existing troubles. At any rate, he strongly urged the need in mission work of "tempering zeal with Christian prudence." His inference was, all along, that modern missions far too often needlessly embroil civilized with barbarous nations. But one at least of the missionary boards has taken up this challenge of the British Premier. The Secretary of the China Inland Mission wrote to the press to explain how the rules of his society explicitly directed missionaries to refrain from appealing to British consuls to "demand the vindication of real or supposed rights." The regulations add: "Under no circumstances may any missionary on his own responsibility make any written appeal to the British or other foreign authorities." The China Inland Mission has been in existence thirty-five years, and in that time has planted one hundred and twenty-five stations in ten of the interior provinces. Its missionaries have gone far beyond the reach of gunboats; yet in all this time only one missionary has lost his life through the violence of the people. On the other hand, British consuls have testified in the most unmistakable terms to the value of the work of the Inland Mission in conciliating the natives, so that they observe a more friendly attitude towards all foreigners. If Lord Salisbury were to apply his cynical analysis to diplomacy in China, and to the seizure of Chinese territory by nominally Christian nations, he would come nearer the exciting cause of the outbreak.

Siberia is no longer to be a penal colony, the synonym of exile and despair. The imperial decree abolishing the former status is not so much a witness to the Czar's humanity as it is a tribute to the railroad and the pioneer. Nothing since the opening of our own Western lands by the Pacific Railways has been comparable to the rapid settlement of the vast Siberian plains by the inrushing farmers who have followed, not the flag, but the iron road. Such colonization and development are Russia's surest pledge of supremacy in the Far East. She advances over wastes to make them productive. What she has done by the Trans-Caucasus Railway, she yet means to do along the whole northern stretch to Vladivostok, and later in Mantchuria. It is not her army nor her fleets which make Russia truly formidable in the Orient, but her traders, her farmers, her missionaries, her civil officials, who swarm in to complete and solidify the conquests of the sword.

Two years ago, Gen. Pelloux succeeded to the embarrassments of the Rudinì Ministry in Italy. It was the time of the so-called bread riots in the great industrial towns. The new Premier faced the grave peril with courage and sagacity, restored the country to order, and entered upon his office with the confidence of the Italian people and the cordial support of the Chamber of Deputies. Yet for a year past, and more, he has struggled vainly against a small but fractious minority, to which he has at length succumbed. The handful of radicals known as the Extreme Left, reinforced from other anti-Ministerial factions, so persistently baffled Pelloux's large majority that, in the general election of June 3, the Premier appealed to the country against the obstructive tactics of the minority, thus making the question of order and discipline in the lower house a national issue. The country returned a sullen answer, the gain of some dozen seats to the Ministry hardly balancing the accession of a score to the turbulent Extreme Left. A significant incident was the defeat of the Speaker, Colombo, in two constituencies. On the second day of the new Parliament, June 18, Pelloux resigned, leaving to Saracco the ungrateful task of forming a new "moderate" Cabinet. Unprincipled obstruction has rarely scored so notably against the most respectable element of a Parliament. Only in the Austrian Reichsrath, where for three years successive premiers have struggled against obstruction, and where the worst racial enmities between German and Czech have arisen, has a like spectacle been seen; and it is doubtful whether the Italian Extreme Left could have pursued their campaign so relentlessly and successfully without the example of a Parliament where violent obstruction had become the *épée de chevet* of either party. Now the country cannot excuse the majority it returns for failing to use the power received from the electors. The people may elect Deputies—they cannot hold the gavel over them.

Not long ago, in an article in *McClure's Magazine* on the Transvaal Republic and its chief, by a writer who claimed personal acquaintance with President Krüger, this statesman was given the character of a blackmailer and a bribe-taker. Some testimony offered in a court of law at Brussels during the past month tends to confirm this estimate of Krüger's character, and also to convict some of his associates of similar charges. The action was brought by the Transvaal Government against the Franco-Belgian Railway Company, which had a contract for building a road in the Transvaal territory. The railway company was accused of fraud in over-charging for the construction of the line. The counsel for the defence affirmed that the company had been blackmailed to an enormous amount by the public authorities of the Transvaal, including Krüger, Gen. Smit, and Commandant Eloff. M. Oppenheim, a leading member of the company, testified that when he was in South Africa he was the victim of a regular system of blackmailing. He spent 600,000 francs in presents, and, believing that he was dealing with people of good faith, he usually asked for no receipts. To Mr. Eloff he handed a check for 100,000 francs, the receipt of which that person acknowledged.

Continuing to give his evidence, M. Oppenheim said that it was repugnant to him to speak of a present of 100,000 francs that he made to President Krüger. He mentioned also numerous presents to members of the Volksraad, although, he observed, these gifts did not prevent the recipients from voting against him. M. Oppenheim declared that if he had not satisfied the blackmailers, no business would have been done. Dr. Leyds, the Transvaal diplomatic agent, was present at the trial as a witness, and was cross-examined with regard to the names of the persons who were alleged to have received presents. He said that a list of those persons had been communicated to him, but he had not read it, and it had been mislaid. M. Graux, the company's counsel, remarked that it was singular that a diplomatist should not have read a document of such importance. Some interesting questions of law are likely to be raised before the decision is rendered. One is, whether a defendant can plead his own wrongful act (bribery) as an excuse for overcharging for work performed under contract. Another is, whether a plaintiff can recover in a case where his authorized agents have been guilty of extortion and corruption. The question whether the damages, if any, shall be paid to Great Britain as the successor of the Transvaal Republic, may possibly come up for determination also.

BRYANISM AT KANSAS CITY.

We do not intend to support William J. Bryan for President under any circumstances, but we intend to tell the truth about him and all other candidates, according as we are able to discern the truth. The revival, in an offensive form, of the silver issue in the present campaign is due to the personal efforts and influence of Mr. Bryan. His opinion has been repeatedly expressed that fully a million of the votes cast for him four years ago would be alienated if the money question, which held the foremost place in 1896, were made a subordinate issue now. The million votes referred to are those of Populists and Silver Republicans. That he has greatly overestimated the number of them is manifest from the fact that both Towne and Teller, who may be supposed to represent them fairly well, put no stress on 16 to 1 in their speeches at Kansas City on July 4, but confined themselves to generalities respecting bimetallism. There are Democrats who voted against Bryan in 1896 on account of the money question, who would vote for him now if the issue of 16 to 1 were subordinated to other issues, or if a preference for bimetallism were expressed in general terms. Mr. Bryan will not tolerate either of these changes. He has deliberately thrown over the electoral votes of New York and all of the East in exchange for the doubtful chance of carrying the trans-Missouri States, where silver is not nearly so popular as it was four years ago. Mr. Bryan's wishes prevailed, though by a narrow majority, in the Committee on Resolutions, and so whatever odium attaches to 16 to 1 and its proposed upset of the standard of value, will attach to Mr. Bryan this year. He has armed his opponents with a weapon for which they could have afforded to pay any price.

Of the platform, the first thing to be said is, that the planks which deal with Imperialism are extremely well written. If produced by one hand, it is the hand of a master. It opens with a felicitous reference to the beginnings of our own nationality, and proceeds to show that the idea upon which our institutions rest is in conflict with the idea of our holding other peoples in subjection, and that the two cannot coexist in one and the same nationality and place. This has been the "stock argument" of all who have opposed the annexation of the Philippines, and of all who have condemned the bill for the government of Porto Rico. There is nothing original in it. It is common property now, but for that very reason it strikes the reader with more force than if it were now for the first time applied to current events of great importance. The plank which defines the purpose of the Democratic party in dealing with the Philippines, demands special attention. It is the following:

> "We condemn and denounce the Philippine policy of the present Administration. It has involved the republic in unnecessary war, sacrificed the lives of many of our noblest sons, and placed the United States, previously known and applauded throughout the world as the champion of freedom, in the false and un-American position of crushing with military force the efforts of our former allies to achieve liberty and self-government. The Filipinos cannot be citizens without endangering our civilization; they cannot be subjects without imperilling our form of government; and as we are not willing to surrender our civilization or to convert the republic into an empire, we favor an immediate declaration of the nation's purpose to give to the Filipinos, first, a stable form of government; second, independence; and, third, protection from outside interference, such as has been given for nearly a century to the republics of Central and South America."

This declaration has a ringing sound, but there is one thing lacking. It favors an immediate declaration of our purpose to give the Filipinos, first, a stable form of government; second (which is more than the Republicans promise), independence, etc. This leaves the Government of the United States the sole judge of what constitutes a stable form of government, and also of the time within which independence should be granted. This defect could have been cured by saying "We favor an immediate declaration of the nation's purpose to give the Filipinos independence *as soon as they establish a government of their own.*" That would have been in accord with the American doctrine of self-government. That would have been our Declaration of Independence applied to the Philippine Islands. Anything less than this comes short of our ideals. Of course we should never give the inhabitants of Luzon the government of a Sultan, but if they want such a government for themselves, we ought to allow it and recognize it, just as we have allowed and recognized it in Sulu. "There is one thing better than good government," said Mr. Edwin Burritt Smith at the Chicago conference last October, "and that is self-government"—a sentiment that was fitly applauded, and has been the real keynote of Anti-Imperialism throughout. It has not only the merit of being a great political truth, but the advantage of being a ready answer to every argument based upon expediency that can be advanced by the other side.

Whether this lapse came into the platform by design or by inadvertence, it is a defect which cannot be overlooked. It is necessary to say, however, that the Anti-Imperialist planks of the platform will accomplish much good, even though Mr. Bryan is not elected President. They will put one-half of the people of the United States in a high school to learn the principles of free government, as a class learns a lesson by repetition and recitation. It cannot be affirmed that the Democratic party had any decided opinion on this subject six months ago. It is certain that the party did not, on July 3, regard the question as "the paramount issue in the campaign." Nevertheless, we look to see the Democratic party get an education which it is much in need of, by standing on and defending the Anti-Imperialist planks of its platform. It is not impossible that the Republican party also may profit by the discussion.

One might almost say of Mr. Stevenson's nomination for the Vice-Presidency that he was made the candidate for this office eight years ago without any particular reason, and that he was taken up at Kansas City because he had run once before. His first selection was due to the fact that he seemed the most available man when the friends of Mr. Cleveland wanted to escape having Gov. Gray of Indiana upon the ticket; while his second success came from the natural reaction against the truckling to Populists which had characterized the previous action at Kansas City. In truth, the Illinoisan is one of those colorless men who find it equally easy to support a Cleveland on a sound-money platform, and a Bryan on a 16-to-1 plank. The sole distinction which he ever achieved was as a thorough-going spoilsman under the first Cleveland Administration, when, as First Assistant Postmaster-General, he cut off the heads of fourth-class Republican postmasters at a rate which causes him still to be remembered with affection by "former Dimmycrats," and which was used as a strong argument in his behalf last week. Mr. Stevenson would stand on any platform, but it is highly appropriate that there should not be even so much as a line in favor of civil-service reform in the one on which he tries his luck this time.

KING CONVENTION.

"King Caucus" was the name which, in 1823-24, came to be given in opprobrium to the method of nominating Presidents by Congressional caucus. That King was finally dethroned in 1824. His nominee, Crawford, was contemptuously set aside by the people, "regular" though the nomination was, and the Congressional caucus itself thereafter took its place in the political lumber-room. It fell because it had become too close a corporation. A pushing and jealous democracy would not longer endure the dictation of candidates by a handful of intriguing managers at Washington. A wider consultation of the electorate and a freer expression of real party choice were insisted upon, and took shape in the National-Convention system.

Whether it, in its turn, has not now gone stale, and, having a name to live, is really dead, is a question which presses for answer. Certainly any sober mind, surveying the proceedings at Philadelphia and at Kansas City, cannot help asking if the National Convention has not already become one of those institutions with which, as Bagehot says, the whole history of civilization is strewn—institutions that were "invaluable at first and deadly afterwards." That such a possibility has hung on the horizon of our own political seers is shown by the confident prediction of Horace Greeley, years ago, that National Conventions would "doubtless in good time travel the same road and encounter the same fate" as the Congressional caucus, upon which, for having abused its power, the people set their heel. And the *Yale Review* for May last, pointing out the disquieting evidence that the National Convention was "sinking into a machine which registers decisions made elsewhere," declared that the crucial question for the American democracy might soon be "whether it can throw off this yoke as it did that of the Congressional caucus seventy-five years ago." This was written before either Convention, though the clank of the machinery of both parties was filling the air.

Now we have the finished product before our eyes; and the opinion of the calmest and most impartial observers, on the spot and at a distance, is that bossism made perfect and delegates made dummies were never before so conspicuously exhibited as at both Philadelphia and Kansas City. It is not simply that foolish things were done—not merely that the machine ground out results fitted to affront the general intelligence. They affronted even the partisan intelligence. The Conventions did not even represent party wishes. With all their air of large party representation, they were the prey of cliques, the helpless victims of sub-committees of committees, themselves made up in most unrepresentative ways. At Philadelphia the sense of restiveness among the delegates, of resentment at being treated like dumb, driven cattle, was perhaps the most marked. "Whom are you for as Vice-President?" "I don't know; I haven't been told yet." That was the kind of cynical and bitter question and answer which passed back and forth. What Hanna calls "organization" had done its perfect work; and the result was a convention in which the signs of life were only galvanic.

Take the matter of the two party platforms. These should represent the consensus of a deliberate majority of the party. What they really represent, in both cases, is hole-and-corner methods and the tyranny of the machine. Everybody knows now how the minority of a minority succeeded in imposing a platform upon the Philadelphia Convention. Not one delegate in ten knew what the document was until he had a chance to denounce it indignantly after it was adopted. Contrast the supineness of 1900 with the watchful jealousy of 1880, when a delegate rose in Convention and compelled the platform committee to add a civil-service reform plank. Delegates were delegates in those days, not lay-figures. And at Kansas City the platform adopted was openly and notoriously in the teeth of the prevailing sentiment of the party. It overrode the demonstrated preference of three-fourths of the Democratic voters. And even in the packed committee the decisive votes were those of delegates from Oklahoma and Hawaii, neither with an electoral vote! Talk about the tail wagging the dog! This is the grin of the Cheshire cat weighing more than the whole animal. This is the bray of a mule, set to pull a load in place of the mule.

Mind, we are not saying these things because we do not like what they did at Philadelphia and at Kansas City. The point we make is that the party convention is fast becoming a Frankenstein in the hands of the party that nominally creates and controls it. The absolute unanimity, the unopposed nominations—does any man believe that these are signs of party vitality? No, they are like the order that reigned in Warsaw, an evidence that all opposition had been ruthlessly crushed. The machine had done its work too deadly well. We think Hanna and Bryan were guilty of a blunder in making things so appallingly unanimous. They ought to have allowed a breath of opposition, so as to keep up the pretence of an open field and a free decision. The veriest simpleton could not fairly assert, looking at the Republican voters instead of at the Republican machine, that Mr. McKinley is their unanimous choice. Mr. Bryan shockingly misrepresents millions of the electors of his party; yet their accredited delegates vote and cheer for him as one man. There could be no clearer proof that the party machine has become the old man of the sea, instead of the obedient servant, of party sentiment. He who has the machine has the party. Who would contest the nomination against the master of so many legions of delegates as McKinley? And Bryan's extraordinary hold on his party, partly a wonderful personal sway as it undoubtedly is, is also partly a result of the way in which he and his followers seized upon the disrupted Democratic machine in 1896, and have since clung to it.

But where is the possibility of reform? What substitute for the National Convention is feasible? Where may we look for

> "—the imperishable change
> That renovates the world"?

We think a beginning of better things may be discerned in the spreading practice in the South of nominating United States Senators and Governors in a general primary election, rather than by conventions or caucuses. Not for delegates, but directly for candidates, do the party voters cast their ballots. The system has worked well, on the whole, and is growing in favor. It is an appeal back to the people again from the machine, allowing the members of the party freely to express their opinion, not as to who should be delegates (to be owned or bought by a boss), but as to who should be the nominee. Imagine the method applied to a national nomination. Does any man suppose that a free Republican primary would have returned McKinley as its unanimous choice and man whom the party delights to honor? How would Bryan have fared under such a test? We know that political conditions in the South are peculiar, and that what works well there cannot always be extended to other parts of the country. But what all can see is that the breath of life has gone out of the old system of Presidential nominations, and that, if it cannot be revivified, directer and surer methods must be found. The new way, if one has to be devised, will surely take the form of a larger and freer *mandat impératif* by the party; and direct voting in the primaries would seem to promise it. At any rate, by one means or another, the hideous oppression of the reign of King Convention, as displayed this year with an unblushing tyranny never before known, must be brought to an end.

A SOCRATIC DIALOGUE.

"I think I got some capacity for cross-examining witnesses, which was very useful to me afterwards, from reading Plato's dialogues and getting familiar with Socrates's method of reducing a sophist *ad absurdum*."—(Senator George F. Hoar in his *Scribner* article on "Harvard College Fifty-eight Years Ago.")

Socrates Redivivus—Well met, Gorgias. I have been anxious to hear you explain, as your friends tell me you can with an unrivalled mastery of the rhetor's art, a passage in your oration to the Ephors which puzzled my poor understanding.

Gorgias Hodiernus—What passage was that, Socrates?

Socrates—The one where you said that it "was due to Mr. Bryan, more than to any other man," that the treaty of Paris was not defeated, or at least amended so as to put the Philippines on the same basis as Cuba.

Gorgias—It is true, Socrates, I made that statement to the Ephors, and by Ammon, the god of Cyrene, I will defend and maintain it in all places.

Socrates—Then you would say that a man who does not defeat an evil deed is more guilty than the man who plans and carries it through by all the means in his power?

Gorgias—What do you mean, Socrates? What I said is clear and certain. If Mr. Bryan had not persuaded the Democratic Ephors, the treaty would have been rejected or amended. Therefore the guilt is on his head.

Socrates—Well, let us follow the argument, Gorgias. Who is the real housebreaker, the man who plots a violent entry for robbery, or the man who fails to eject him?

Gorgias—It would be the former, Socrates.

Socrates—And you would say the same of political robbers?

Gorgias—I do not know what you mean, Socrates.

Socrates—Well, I will ask you what you would say if a Spartan general should agree with a Persian satrap to corrupt the Lacedæmonian state by introducing Persian customs—whom would you blame, that general or a private citizen who weakly acquiesced in his plot?

Gorgias—The general would be the man, Socrates.

Socrates—That is, you distinguish between the principal and the accessory?

Gorgias—All men do, Socrates.

Socrates—Then, by the dog of Egypt, tell me who was the principal in the matter of the Paris treaty. Was it Mr. Bryan?

Gorgias—No, but he "frustrated" the attempt to defeat it.

Socrates—But President McKinley might have frustrated the treaty itself, might he not? He negotiated it, did he not? When you were opposing its ratification, he was urging it, night and day, was he not?

Gorgias—I cannot deny it.

Socrates—Then, in the name of Zeus and Athene at once, how can you, who denounce the accessory, praise the principal? How can you say that the man who is chiefly responsible for what you describe as an attempt to "change our republic into an empire," is the "best beloved President who ever sat in the chair of Washington"?

Gorgias—But I expressly said that I had never questioned the honesty of purpose of President McKinley.

Socrates—Yet you do question Mr. Bryan's honesty, Gorgias?

Gorgias—How so, Socrates?

Socrates—You said you thought he wanted the treaty ratified so as to "keep the question for an issue in the campaign."

Gorgias—Yes, I said that, Socrates.

Socrates—But how could the deed of an honest and beloved President be an issue in the campaign?

Gorgias—It might seem, nevertheless, bad for the state.

Socrates—Then an honest and beloved man might yet ruin the republic?

Gorgias—That is so, Socrates.

Socrates—A dishonest and hated man might save it.

Gorgias—It would seem so.

Socrates—Then it is better to be right than to be beloved?

Gorgias—Better in a public man, I admit. Mr. Bryan, however, was both wrong and disliked. He was for ratifying the treaty, and that meant a continuation of the war.

Socrates—Yet he said he wanted to end the war, did he not?

Gorgias—He did.

Socrates—And he urged his friends to vote for the joint resolution putting the Philippines on the same footing as Cuba?

Gorgias—Even so, Socrates.

Socrates—And they did so?

Gorgias—They did.

Socrates—You voted for it yourself?

Gorgias—Assuredly, Socrates.

Socrates—And it would have ended the war, if adopted, and prevented the republic from becoming an empire?

Gorgias—I have no doubt of it.

Socrates—Yet McKinley was against it? All his friends among the Ephors voted against it? It was defeated only by the casting-vote of the Vice-President? Are not all these things so?

Gorgias—They are.

Socrates—Then must you not admit that Bryan and his friends wanted to end the war and save the republic, and that McKinley and his friends were really the ones who prolonged the war and threaten now to convert our state into an empire?

Gorgias—No, Socrates, I do not admit it. By Herë, I never will admit that!

Socrates—But why not, if truth and argument compel you?

Gorgias—Because I am a Republican, Socrates.

Socrates—Exactly. I merely wanted to know if it was the truth you were in search of, or an excuse for supporting your party. Well, good-by, Gorgias. Send me word if the entrails indicate that you will be chosen Ephor again.

OUR TRUE CHINESE POLICY.

With the official confirmation of the rumor that the German Minister had been massacred in the streets of Pekin, there was a sharp revival of talk about dismemberment of China. Hot and proud William will take a swift revenge and seize a province or two by way of enforced indemnity. His speech to the German marines on July 2 was a model of threatening. Of course, with such an example, the other Powers would hasten for their share of the prey, and China would be thoroughly cut to pieces and divided. The break-up is going on already "at lightning speed," writes Mr. A. R. Colquhoun in his book 'Overland to China,' just published by the Harpers; and he predicts a speedy and utter extinction of Chinese nationality and government.

Such a glib suggestion of a solution for the intensely difficult Chinese problem, thrust upon a world all unprepared, is both premature and perilous. Caution and a wary feeling our way should be the watch-words of any Chinese policy for the present. The trouble is grievous enough already; it might easily be made worse, however, by rash and inconsiderate treatment. It is at the very beginning of a political disturbance that, as the Italian master of statecraft pointed out, the political physician has his opportunity. The symptoms may be obscure at first, said Macchiavelli, but wise treatment may be effective then which, after the disease has become both more clear and more deadly, would be wholly without avail. Healing measures from the very start should be the motto in every Foreign Office.

Angry threats to "avenge" the slaughter of the German Minister, and of other foreigners in Pekin (if, unhappily, they have fallen victims to mob fury), are most ill-timed and inapplicable. It is like the foolish outcry in England about taking "revenge" for Gordon's death and for Majuba. As John Morley, the alleged atheist, said in the teeth of the Christian University Dons, they had their chairs of moral philosophy, they had a thousand pulpits, to teach that the doctrine of revenge is unchristian and barbarous, yet a Christian country was expected to gloat over a bloody national vengeance! Aside from this moral difficulty, there is the troublesome question, On whom are you going to glut your vengeance? The Chinese Government? First catch it. The people of China? But how many of the 350,000,000 know anything at all about the existing troubles, or have any responsibility whatever for them?

The fact is, we must make up our minds that ordinary remedies and methods will never do. We cannot deal with the Chinese Government or people as we would with any other. We really are confronting, not an organized government or a homogeneous people, but a vast congeries of governments, a huge conglomeration of peoples. It is not a case where a blow on the head will be felt throughout the whole organism. It would be like striking an amœba. In 1860 Lord Elgin ordered, as a measure calculated to strike terror throughout all China, the destruction of the Summer Palace. But the news of the event scarcely reached Pekin, only twelve miles away, and the rest of China never heard of it. It was a pebble dropped into the ocean. An English member of Parliament, Mr. Walton, who travelled far up the Yangtse last February, found whole provinces and even Government officials that had never heard of the Japanese war. Such is the difficulty of taking vengeance on an amorphous nation without a nervous system!

Nor can the Powers plume themselves on the success, thus far, of their stern and warlike attitude towards China. The attack on the Taku forts seems to have been an unnecessary and ill-advised affair. Admiral Kempff was at first covered with reproaches by the press and some hasty public men for having missed the chance to go in with an American ship where such elegant fighting was going on. Later, however, it was evident that he was the only commander present who kept his head, as well as lived mies of the United Kingdom be taken as premonitive of the spirit likely to animate an Irish Parliament for local affairs. It is more probable that such an assembly would before very long display the same spirit as the colonies. I have, indeed, heard Irishmen say, since the commencement of the present war, that the action of the colonies in blindly supporting wrong in the supposed interest of the Empire, somewhat reconciled them to the absence of Home Rule, because, under Home Rule, Ireland would be likely to do the same. Home Rule would certainly tend to make Ireland one in sympathy with the Empire; but her history and traditions are so different that it is improbable she would be so blindly influenced as are the colonies.

This convention is not likely, as I have said, to be without considerable influence. Concerning Home Rule it is not easy to predicate. It is to be remarked that the acceptance of Home Rule is more and more being made to imply the acceptance of other popular desires. The Convention of 1873 dealt only with Home Rule. The movement then inaugurated was moribund when Davitt and Parnell yoked land reform thereto and carried it so near success. At the time of the Parnell split in 1890, a single Home Rule plank had been returned to. The moment that catastrophe occurred, both parties strove to attract followers on other grounds. The Convention of 1896 covered nearly, though not so definitely, as much ground as the present. It is difficult to judge to what degree Home Rule may be but a pious opinion, the other claims those which really come home to the hearts of the people in Ireland. The belief of Irish Nationalists sixty years ago was that every reform granted in Ireland would strengthen and increase her desire for Home Rule, and her means for advancing it. This does not appear to be so. Each great reform has been effected largely through the enthusiasm of its being yoked with a national demand. But, when accomplished, the special adherents, those who most directly benefited by the change, have rather retired satisfied to their tents. This tendency is nowhere more observable than in the Catholic Church and in the upper grades of Catholic society. A cause cannot be said really to prosper, adherents to which can be attracted only by the putting forward of a number of questions, the settlement of which would all be included in the main issue. If the desire for Home Rule is genuine, every other question should make way for it. Thousands believe in Home Rule who cannot accept these additions to the programme. Others would be found willing to assist in advancing many of these desires if Home Rule were not joined to them.

The long simmering of this question without steady, continuous, vigorous action, has an unfortunate influence on Irish affairs and Irish prosperity. A large proportion of the Irish people indubitably desire Home Rule. The question is, whether they desire it to the extent of sacrificing and spending for its attainment; and unless they show that they desire it to that degree, it will be impossible for them to retain the sympathy of their friends at home and abroad. I have, I believe, before noted in your columns that, at the local Government elections, while many opponents of Home Rule accepted by popular constituencies, [illegible] Catholic and Socialistic questions were returned; and that many old and tried Protestant Home Rulers (who, as exponents of genuine Home Rule feeling, it would have been of prime importance to send forward) were rejected for less qualified men who more really represented sectional feeling. A significant situation had in this regard before these elections come about in Belfast. A change in the law for the first time gave a majority in certain wards to what had theretofore been known as the National Home Rule party. The Catholic Bishop stepped in and insisted that candidates should be chosen on Catholic, not national, grounds. In the face of vigorous protest he carried his point, and Protestants theretofore excluded from office because of their Home Rule opinions found themselves doubly excluded because of their religion. This, however, is not the spirit generally shown throughout Ireland.

Those most responsible for the advancement of Home Rule express themselves satisfied with the outcome of this convention. A very few years must now decide whether or not a burning desire exists on the part of the Irish people for a radical change in the relations between the countries—whether the apathy of late years has arisen only because of party differences, or whether it may not be due to changes in the thoughts, feelings, and tendencies of Irish society. One possible disintegrating element cannot be left out of account. Mr. Healy is, in a certain sense, one of the ablest Irish politicians. He has an important following in and out of Parliament. In the differences and discussions of the last few years it has always somehow occurred that he has in the end been found in opposition to the majority of the party to which he appears to have given his adhesion. And it has happened that those whom he has considered it his duty most to discredit, and, where possible, drive out of politics, are those who, to the majority of his countrymen, appear most useful, earnest, and devoted in the cause of home rule. After giving full adhesion to a reunited party a few months ago, he and his are now setting themselves bitterly in opposition to the work of this convention, the outcome of the deliberations of the said party. There is no legal justification for saying that his views have changed concerning the desirability of the continuance of a movement for Home Rule. It is, however, incontrovertible that, if a man desired the destruction of such movement, he could not better set himself about it; and there can be little doubt that he is receiving the support of a large number who do not desire openly to admit they are tired of the agitation.

Irishmen are deplorably prone blindly to follow those in whom they have once placed their trust, to abnegate their reason, to swallow wholesale statements without proof, to continue to believe, if they so desire, what has been over and over again proved to be untrue. This may be partly owing to the tribal system having prevailed over most of the country until within the last three hundred years. Until the recent remarkable display of similar characteristics in the English people in reference to the Transvaal war, it might have been supposed by some to arise from adherence to a religion that makes such large demands on faith and imagination. There is one consideration forcibly impressed upon many by the course of Irish affairs—the greater difficulties in the assertion of political desires, in the path of a people devotedly attached to spiritual leaders acting under influences outside their country, which mainly consider the prestige and advancement of a world-wide church, than those in the way of people ,the government of whose churches is centred in their own country. D. B.

A LEXICOGRAPHER ON LEXICOGRAPHY.

OXFORD, June 22, 1900.

This year's Romanes lecture was given today, not by any far-fetched savant unfamiliar to Oxford, but by the indefatigable Dr. James A. H. Murray, whose name and work have done and are still doing so much to centre the interest of all students of English in Oxford. Appropriately indeed he chose for his subject "The Evolution of English Lexicography."

He began by humorously complaining of persons who speak of 'The Dictionary' as of 'The Bible,' or of 'The Psalms,' and who, "if pressed as to the authorship of these works, would certainly say that 'The Psalms' were composed by David and 'The Dictionary' by Dr. Johnson." Against these thoughtless people he maintained that the English Dictionary, like the English Constitution, was the creation of no one man, but a growth that had slowly developed itself through the ages. Its beginnings were "neither Dictionaries nor English," but Latin glosses of the seventh and eighth centuries of our era. These explanations of the meanings of difficult words were written between the lines of old Latin MSS., sometimes giving a more familiar Latin equivalent, but sometimes also giving a vernacular English definition or translation. After a time these glosses were copied out into glossaries. Soon came in, among clerics of Teutonic speech, the habit of making vocabularies to facilitate the learning of Latin—the vocabulary being a list of Latin words with their vernacular equivalents. Vocabularies and glossaries made in connection with special books were finally fused together into very bulky documents. As these grew longer, the need of alphabetical arrangement became imperative. Our full-fledged plan of alphabetical order, however, was not achieved in a day. The first step was to bring together all the words having the same first letter. A second step so far improved upon this first-letter order as to rearrange the words beginning with A, B, and C, alphabetizing them according to the second letter.

The "Leiden Glossary," well known to special students, represents the wholly unalphabetical stage of arrangement, and was described by Dr. Murray as "a collection of smaller glossaries, or rather sets of glosses, each set entered under the name of the treatise from which it was extracted, the words in each being left in the order in which they happened to come to the treatise or work." The "Épinal Glossary," using largely the materials of its predecessor, is arranged in first-letter order. The third stage is represented by the "Corpus Glossary," so called from Corpus Christi College, Cambridge, which is in second-letter order. These three glossaries date back to the early eighth century and beyond, while there is one glossary in the British Museum (Harleian 3,376), belonging to the tenth century, of which Dr. Murray spoke as being arranged in third-letter order. So far and no further did the systematization of early English word-lists go. Nor were these lists, the earliest of which must have been begun between 600 and 700 A. D. (not long after the introduction of Christianity in Kent), prevailingly lists of Old English words until the Corpus Glossary and its successors were compiled. These tended to become a Latin dictionary for the use of Englishmen.

"The Normans," said Dr. Murray, "were about as far behind the people whom they conquered as the Romans were when they made themselves masters of Greece." Hence English lexicography stood still for more than 300 years after the Conquest, which overthrew Old English learning and literary culture, and abolished nearly all its poetical, philosophical, scientific, and artistic vocabulary. Professor Wülcker's edition of Thomas Wright's collection of early word-lists shows only two meagre vocabularies between 1066 and 1400, and of these one is but an echo of the earlier literary age of Alfred and Aelfric, while the other is a meagre list of plant-names. With the end of the fourteenth century, however, English lexicography reflects the return of English ascendancy, and we have six important vocabularies of the fifteenth century, prepared chiefly for helping boys to learn Latin. Notable among these was the 'Promptuarium Parvulorum,' of Brother Galfridus, Englished by Dr. Murray as "The Children's Storeroom or Repository."

With the renascence of ancient learning came, during the sixteenth century, many important Latin-English and English-Latin vocabularies, notably the Dictionary of Thomas Elyot, Knight, "the first work, so far as I know," said Dr. Murray, "which took to itself in English what was destined to be the famous name of *Dictionary*." After curious details as to quaint alternative names current in Elyot's day, such as Abecedarium, Glossographia, World of Words, Bibliotheca, and Gazophylacium, Dr. Murray spoke of the lexicographical activities of Thomas Cooper, "Schole-Maister of Maudlens, Oxford," the son of an Oxford tradesman, who became Dean of Christ Church and Vice-Chancellor, and of the 'Vulgaria' of William Horman, printed by Pynson in 1519. He also mentioned Howlet's 'Abecedarium' (1552), and the 'Alvearie' of John Baret (1573), "one of the most quaint and charming of all the early Dictionaries," and of the 'Manipulus Vocabulorum,' or English Riming Dictionary, of Peter Levins (1570).

A new departure had been made meanwhile in 1521, when Alexander Barclay's 'Introductory to write & to pronounce Frenche' was printed, with a vocabulary by Robert Coplande. For Henry VIII.'s sister Mary was written Palgrave's 'Esclaircissement de la Langue Françoyse,' published in 1530. This last is "the earliest Dictionary of a modern language, in French as well as in English." Similar publications for Spanish and Italian were then mentioned by Dr. Murray —a Spanish one in 1599 by Richard Percival, Gent, and "resolute John Florio's 'World of Words' (1611)"; nor did he forget the second Dictionary of English and another modern tongue (Welsh), "by me John Waley, 1547." Last, but not least, came Randall Cotgrave's famous French-English Dictionary, published in the same year (1611) with Florio's Italian-English work.

After a tribute to the racy English vocabulary of Florio and Cotgrave, the lecturer noted the chronological coincidence of their publications with the promulgation of King James's version of the Bible, and then turned to the first signs of a recognition among Englishmen that they could want a dictionary to help them to the knowledge and correct use of their own language. This he detected in "a modest octavo of 120 pages, 5½ by 3½, calling itself the *Table Alphabeticall of Hard Words*," by Robert Cawdrey (1604), a schoolmaster. A similar work appeared in 1616, and finally in 1623 appeared 'The English Dictionarie,' by "H. C. Gent"—*i. e.*, Henry Cockeram. Dr. Murray here entered into the humors of this most marvellous of vocabularies, wherein *adcorporated* means married, *bubulcitate* is explained as 'to cry like a cowboy'; and quoted in full its edifying account of the Crocodile. Of similar use was Thomas Blount's less entertaining Dictionary of hard words (1656), which went through many editions down to 1707. Then the lecturer, after interesting reference to the needs of women as having prompted the publication of several of these earliest English dictionaries, and after a generous tribute to the part played by women in our own day in the establishment of English study on a sound and secure basis, passed in rapid review various successive dictionaries of hard words, including the 'New World of Words' (in which Edward Phillips, a nephew of John Milton, so serenely helped himself out of Thomas Blount's stores), and fixed his attention upon the mathematician, John Kersey, who edited the last and posthumous issue of Phillips's work.

This same John Kersey ended by throwing Phillips's materials into another form, a 'General English Dictionary,' of which three editions appeared before 1721, and almost stumbled upon the idea that an English Dictionary should contain all English words and not simply "hard words." But this further step in the evolution of the modern dictionary was still to be made. Nathaniel Bailey, the man who made it, was, said Dr. Murray, "one of the most deserving in the annals of English Lexicography." His great work was his 'Universal Etymological English Dictionary' (1721); and though for us his fame has been eclipsed by that of Dr. Johnson, who is to us *par excellence* the eighteenth-century lexicographer, yet, said Dr. Murray, "down beyond the middle of that century, and to the man in the street much later, by far the best-known name in connection with dictionaries was that of Nathaniel Bailey." When he died (1742), the tenth edition was in the press, and successive editions were called for every two years until the end of the century.

Bailey furthermore brought out in 1730 his folio dictionary, which, according to Sir John Hawkins, formed the working basis of Dr. Johnson. Here Dr. Murray touched upon the peculiar genius of the age of Queen Anne, and spoke of the prevalent fear of decay in the language which resulted in a general desire "to fix" it by means of a Standard Dictionary after the fashion set in Italy by the Accademia della Crusca, and in France by the Académie Française. Johnson's Dictionary was the culmination of this general movement in England. Its special new feature, contributed to the evolution of the modern dictionary, was "the illustration of the use of each word by a selection of literary quotations, and the more delicate appreciation and discrimination of senses which this involved and rendered possible." Only where he had no quotations did Johnson insert words from Bailey's folio or other sources with "Dict." as the authority. Here followed a most generous and discriminating appreciation of Johnson's merits, and a lucid description of his method, as well as a passing mention of some of his errors, *e. g.*, in dealing with the words *coco* and *cocoa*, and with the word *dispatch*.

Dr. Murray's final verdict pronounces Johnson's Dictionary "a marvellous piece of work to accomplish in eight and a half years," and declares it to be quite certain "that, if all the quotations had had to be verified and furnished with exact references, a much longer time, or the employment of much more collaboration, would have been necessary." To this direct judgment, great point was added when the lecturer subjoined the further statement that, "with much antecedent preparation, with much skilled coöperation, and with strenuous effort, it took more than nine years to produce the first three letters of the alphabet of the Oxford New English Dictionary."

Johnson thus raised English lexicography to an altogether higher level. "In his hands," said Dr. Murray, with pardonable enthusiasm, "it became a department of literature." The briefest suggestion of the closing ten minutes of his lecture must suffice. Bailey and Johnson indicated the stress-accent; Kenrick and Walker brought in the careful indication of pronunciation—told what was the living word apart from its written symbol. In the closing century came Noah Webster and Charles Richardson. Of Webster, the lecturer spoke with eloquent appreciation; "Webster was a great man, a born definer of words; he was fired with the idea that America ought to have a dictionary of its own form of English, independent of British usage, and he produced a work of great originality and value." After a merited word of reprehension touching Webster's etymological vagaries, corrected in later editions, Dr. Murray pronounced the last edition of Webster, the International, "perhaps the best of one-volume dictionaries." Of Richardson also the lecturer spoke admiringly, and then gave a summary of the undertaking at the head of which he now stands, the 'New English Dictionary.' Not unnaturally, Dr. Murray effaced himself in this sketch, which began with the late Dean Trench's account of "Some Deficiencies in Existing English Dictionaries," addressed half a century ago to the London Philological Society.

Those of us who have followed the fortunes of the 'New English Dictionary' since and before the expenses of it were undertaken by the Clarendon Press, which ultimately means by the University of Oxford, are able to read between the lines of Dr. Murray's too modest account of this matter, and to admire the clearness of vision and tenacity of purpose exemplified in our great lexicographer's high-minded devotion to a scientific ideal. Large though our debt is to Dean Trench and to the Philological Society, it is larger still to Dr. Murray. Nor is it fair, in summing up, to forget the University of Oxford, which will certainly stand out in the eyes of all English-speaking peoples as a great institution of learning which is seriously crippled in all its branches, and will be so for the space of two generations, in order that the world of English speech may be dowered with a 'New English Dictionary,' containing the minutest record that science and unintermitting labor can achieve of all the facts concerning every word in the whole English language, past and present.

Louis Dyer.

THE PARIS EXPOSITION.—III.

THE FRENCH FINE-ARTS SECTION.—II.

Paris, June, 1900.

Whatever the Romantic Revival may mean to us, to its brave young leaders it meant, above all, the breaking away from the teaching of the schools and the cult of their own individuality. But, as I have said, nothing in their work, as you see it in the Exposition, strikes you more than the fact that few among them possessed any special personality to cultivate, and that, despite their protests, tradition still lingered. There is but a suggestion of individuality in Delacroix, none whatever in Célestin-Nanteuil, Devéria, Roqueplan, or the other young heroes of the Cénacle. Géricault died too young to fulfil the promise he gave, and Daumier, after all, devoted himself chiefly to black-and-white. Even in Corot, the new study of values does not quite destroy the old respect for Claude; and, if the legs and trousers of Millet's "Wood-Sawyers" caused consternation in the Paris studios, the picture now seems to us more in sympathy with the sober landscapes of the past than with the realistic studies and brilliant impressions that came after. Courbet, it has been said, was swept forward on the very crest of the wave of Realism. But Manet was practically the first to succeed in going direct to Nature, and to emancipate himself entirely from the leading-strings of tradition. He is the most legitimate outcome of Romanticism—that is, as its leaders understood it—though he was not born until the heat of the battle was over, and did not exhibit until, as a movement, it was at an end. His work, as you come to it in chronological order, is as startling as Géricault's among the Classical *machines*, and it is easy to understand the outcry it raised thirty years ago, when the best that Gautier could say for it was that it stimulated curiosity, and that, if Manet would only take the trouble, he might be a good painter.

As if to make up for the two International Exhibitions (1867 and 1878) when no place was found for him, as many as thirteen of his pictures are now included, almost filling one gallery. They have been chosen so as to give an excellent idea of his methods at different periods of his career, from the "Déjuener sur l'herbe" and the "Combat de Taureaux," when he was still influenced by Spain and Velasquez, to the outdoor subjects painted after 1870, when he had begun his *plein-air* experiments and the practice of his *peinture claire*. There are characteristic portraits: the Marcellin Desboutins, Madame Gonzales; and "Déjeuner dans l'atelier"; there is a sea piece, "Boulogne, sortie du port"; there are studies of asparagus and peonies, technical miracles worked by the man of all others, perhaps, who could intoxicate himself with paint for its own sake; there is one, at least, of those uncompromising renderings of a vulgar subject, "Un Bar aux Folies-Bergères," in which he triumphs by his beautiful painting of ugly detail. But of all these things, it is probably by the famous "Déjeuner sur l'herbe" that his reputation is assured. This is the picture that hung in the Salon des Refusés of 1863 or 1864, with Whistler, Bracquemond, Harpignies, and Legros. It belongs to much the same period as the "Olympe" of the Luxembourg—it is interesting to find water-color studies for both down stairs—and has the same fine qualities. It is masterly in the treatment of the nude in the figure of the model; the splendor of the blacks in the coats of the men who sit with her under the trees, and their contrast with the flesh tint; the exquisite detail, here—instead of the bunch of flowers, a basket with fruit and rolls scattered over the grass; the cool green of the wood; the distant stream, and the woman, half-dressed, wading through it. In this, Manet was painting a picture. In so many of his later canvases, he was but making experiments, brilliant, without doubt, and of enormous interest. But the perfect work of art is something more than experimental.

In the little group who owed their immediate inspiration to Manet, the experiment, it seems to me, becomes still more obvious; more so, curiously, in their later than in their earlier canvases. There is a room of Monets, Sisleys, Pisarros, and Renoirs; also examples of Cézanne and Mme. Morisot; though nothing by the most extreme of the group, Anquetin and Signac. As in the Caillebotte room at the Louvre, these impressions—it is convenient to use Monet's now accepted word for them—do not improve when shown in numbers together. The faults, not the beauties, are emphasized. From their theories of brush work, of the division of colors and tones on their canvas, amusing and fresh in the beginning, these painters developed mannerisms that are irritating. Take M. Claude Monet as an example, for, unquestionably, he is the most accomplished and distinguished of them all. In his first pictures, whatever his methods, he did give the effect he wanted; he did seize the impression of the moment and perpetuate it on his canvas, so successfully that you see only the loveliness of the passing train enveloped in its clouds of smoke, or the stretch of quiet, blue river in sunlight, or the silvery trees on a lakeside, or whatever it may be, without stopping to ask how the thing is done or what are his methods. But gradually his technical devices seem to have absorbed his attention until you cannot see the picture for the dots of color, and a landscape is transformed into a dazzling mosaic of tints from which, at the Exposition, at all events, you never get far enough away to discover a definite pattern or design. And I think, after the Corots and Daubignys, the Rousseaus and Troyons down stairs, you cannot but be conscious of the indifference of all these men to beauty. They accept Nature as she is wherever they happen to be brought face to face with her. If tree forms are not graceful, if lines are awkward, the fault is Nature's and not theirs; they wash their hands of the responsibility. Nature, as we have been told, is usually wrong, and many of their pictures seem but a bald statement of her indiscretions. It is the merest chance when a beautiful subject or composition preoccupies them.

Impressionism made such a noise in its day, it excited such heated controversy, such violent partisanship, and still more violent enmity, that one is apt, as in the case of Pre-Raphaelitism in England, to exaggerate its importance and the sphere of its influence. It seems to one now as if, thirty years ago, in France, the painter who was not an Impressionist simply did not exist; as if the new theories and methods exhausted all that was original and individual in the then younger generation. But it is the merit of a retrospective exhibition that it helps one to see things in their true proportions, their true relations. The fact is, that many artists as original and vigorous as Manet and Monet were seeking their artistic salvation on entirely different lines, and that Impressionism was but one—and not the most influential—of many forces at work in the schools and studios. In the very gallery with the Manets are portraits by M. Fantin-Latour—among them, a wonderful group of black-coated men gathered round the end of a dinner-table, in a gray room, almost Whistlerian—that have much of the feeling and dignity and solemnity of the old Dutch masters; for, at that time, Fantin had not devoted himself to flowers and nymphs and goddesses in mystic woods. There are two pictures—his finest, "L'Ex-Voto," of an earlier date from the Dijon Museum—by M. Legros, that show him also busy developing his individuality, not by evolving new theories, but by studying old masters. There are designs by Gustave Moreau and Puvis de Chavannes that explain how far Impressionism was from engrossing all artistic energies; though it must be confessed that the "Salomé," the "Vénus," and the others by Moreau, with their overloaded detail, their artificial mysticism, their affectations, hardly seem more genuine than the Rosicrucian romancing of Sar Péladan, and have little charm of color or line or composition to redeem them, while the examples of Puvis, if they do include a sketch for one of the Amiens series, fail to give an adequate idea of the distinction and dignity of his decorations. There are several pastels, if only two paintings, by Degas, the incomparable draughtsman, and, for sake of contrast, the essays in Realism of Bastien-Lepage, once the idol of the schools. There are landscapes by Cazin and Billotte, who have gone calmly upon their way as if controversy had never raged over the decomposition of tone and the use of complementary colors; and landscapes by Harpignies and Français, who never swerved from the principles of Romanticism. There are pictures by Fromentin, as independent in his painting as in his criticism; brilliant sketches by Henri Regnault to fill one with regret for the life's task unfinished; portraits by Baudry; academic studies of the nude by Falguière, who, though one had forgotten it, could paint; characteristic work of Meissonier, Hervier, Couture, Manet's master—it is not possible to go through the entire list. And after this there are so many things by men who exhibit as well in the Decennial Section that the two exhibitions cannot be separated. They overlap each other so completely that, but for the numbering of the galleries, you might not know where the one ended and the other began. Indeed, it would have been almost better to exclude living painters from the Centennial Collection and so avoid confusion.

The contemporary section is necessarily nothing more nor less than a reunion of the two Salons. Here are the men for whom you have been accustomed to look in each—M. Harpignies and M. Pointelin, M. Fantin-Latour and M. Henner in the Champs-Élysées; M. Cazin, M. Carrière, and M. Besnard, M. Adam-Jean and M. Cottet, M. Simon and M. Billotte, M. Lhermitte and M. Raffaëlli, and a dozen more in the Champ-de-Mars; though the absence of the foreigner from their midst is a loss. Here you find the old familiar banalities of Bouguereau, the portraits of Bonnat, which the Centennial collection convinces you have not grown more refined with time; and here the amusing portraits by Gandara, the Dutch-like studies of still-life and the sheen of metal by Ball. As a rule, the pictures are those already exhibited and long since discussed and classified; the sensations of ten years—the crimson horses of Besnard, the religious naturalism of Béraud, the vague crucifixion and vaguer theatre of Carrière, the wrestlers of Simon, the decorative dreams of Aman-Jean, and so on through an inexhaustible catalogue. They fill gallery after gallery in bewildering numbers, for the French artists have reserved for themselves as much space as they have spared for all other countries together. It is simply out of the question, therefore, to speak of the pictures separately or at length. All that can be done in an article of this kind is to endeavor to give some idea of general tendencies and characteristics. I can but speak from personal experience.

As I wandered through the interminable succession of galleries, I found myself marvelling at the state of quiescence into which art seems to have fallen in France after almost a century of "storm and stress." There are no signs of new movements, no daring departures, no gay proclamations of rebellion. I know it is the object of the Exposition to show what has already been accomplished, rather than to bring forward the younger men who may accomplish much in the future. It is the same in every other section; only the artist who has arrived is given a place. But ten years can see many changes and innovations; think what was done in the thirties and in the seventies! This last decade, however, appears to have been one of rest, much needed rest. The men of note in the Decennial collection, who do not figure in the Centennial, are few: M. Aman-Jean, M. Simon, M. Cottet, M. Ménard are the artists who occur to me at once, and, delightful as their work often is, they have had no influence on their generation. Whatever activity there has been during the last ten years has led really to reaction. It is astonishing to see how ephemeral has been the reign of impressionism. I was reading the other day a panegyric of Manet, in which it was declared that the artist, young or old, who had not been affected by his doctrines was the exception. But look around these galleries. Certainly a great deal has been learned from impressionism; every serious artistic movement, or even revolt, must have something to teach. And, certainly too, there are men like Besnard and Roll and Henri Martin and Eliot who, each after his own fashion, and within limits, have accepted the new creed preached by Manet and his disciples. But upon the work of the great majority, impressionism has left not a trace.

These are the negative tendencies from which there is no escape. But one very positive fact confronts you as persistently at every step—the immense technical knowledge and skill of the French painter. No one ever has mastered so thoroughly the grammars of art, though he may not, and usually has not, anything in particular to say, any message of his own to deliver to the world. I have stood appalled before some of the big *machines*, so common always in the two Salons, with their evidence of the painter's learning, his technical power, his amazing physical energy and endurance. In the Centennial collection, Lhermitte, whose strength is apt to be overlooked nowadays, and Carolus-Duran, whose huge "Assassiné" of 1866 accounts for the beginning of his reputation in the schools, are perhaps the two most astonishing. After that, it would be almost easier to say who does not overwhelm you with his ability to cover a gigantic stretch of canvas. One room in particular appeared to me typical of the attainments now in vogue, viz., the large room where M. Benjamin-Constant's design of the "Entry of Urban II. into Toulouse," the town for which it is destined, fills a centre, and is flanked on either side by the big arrangements of the nude *en plein-air* by M. Gervais, and the clever portraits of M. Blanche, and the brilliant studies of light by M. Gaston Latouche; these, in their turn, faced by the colossal performances of M. Tattegrain and M. Quentin. Or, there is a group of galleries where Roybet, and Rochegrosse, and Detaille, and Gervex, and Jean Paul Laurens, and Henri Martin, and Montenard, and Lefebvre, and Boutet de Monvel, and Dubufe follow each other in an amazing rapidity—as if to carry out a motive historical, or mystical, or illustrative, on such a scale were a mere everyday task. I do not say that the result is invariably a masterpiece; usually it is not; and, anyway, it cannot fairly be judged until the design is seen in the place on the walls and in the light for which it was intended. But I do say that the skill with which canvases of this class are turned out is a tribute to the technical traditions honored nowhere so sincerely as in France, and to the thoroughness of the schools to which the whole world now throngs. When the new genius does arise, it will be his own fault if he does not set out upon his career with a sound technical basis for his most imaginative or emotional flights. At times, fine technique is not the sole merit. M. Dagnan-Bouveret's "Last Supper" is placed at the end of a series of galleries, where all that is most theatrical in it becomes doubly conspicuous, where all that is most artificial in its scheme of illumination seems more pronounced than when I saw it first at the Champ-de-Mars. And yet, here, it was less easy than at the new Salon or when it appeared swathed in draperies in a London gallery, to deny the sincerity, the solemnity, that underlies the too obvious dramatic intention of its contrasts of light and shadow. And so it was with M. Cottet's sombre Breton Supper and brilliant Procession in the adjoining room. There is the same facility, but they are the work not only of the able painter who has a commission to fulfil or his mark to make in an exhibition, but of the artist who feels the beauty, the dignity of his subject, and strives his utmost to give it worthy expression. If he fails, there is more interest in his failure than in the success of the astonishingly clever manufacturer of the Salon *machine*.

I regret the more I have not space to go into detail, since I have left so much unsaid that I should like to have said. But I think I have explained the general character of the French Section in the Palais des Beaux-Arts, when I add that it confirmed me in the conclusions drawn from the Salons of recent years that, while ability is the rule in France at the end of the century, originality is the exception. To what purpose, then, it may be asked, the agitation, the revolts, the rebellions, the revivals, the unceasing strivings of a hundred years? To what good the struggle of Romanticism, of Realism, of Impressionism, and of all the other isms that have followed each other with the generations? You will have the answer if you go back, as I did, from the modern to the earlier room hung with the brown frigidities of David and his disciples. There may be stagnation, even decadence, for an interval, but, on the whole, the century has been one of development, not of retrogression.

Correspondence.

INDIAN SONG.

To the Editor of The Nation:

Sir: In a review of 'Indian Story and Song from North America,' published in your issue of June 7, the writer states: "No Indian ever uttered sentences like these: 'The sky was clear. The grass and wild flowers waved in the breeze that rose as the sun threw its first beams over the earth. Birds of all kinds vied with each other as they sang their joy on that beautiful morning.'" This misunderstanding of the Indian on the part of my critic I beg you will kindly allow me space to correct.

Among the Pawnee, from whom the above quotation is made, as well as among other tribes which I have studied in the field for the past twenty years, "The sky was clear" (or "is clear") is used as a symbolic expression as well as a statement of fact, and not infrequently occurs in religious rituals. The next sentence of the quotation is also symbolic as well as actual. The rituals tell that the wind gave breath to man, and is the breath of the gods. The breeze, that every early riser has noticed, which comes with the daybreak, can be explained by the meteorologist one way; to the Indian it is the breath of the gods bringing (or giving) new life to the new day. The rituals also teach that the first beams of the sun carry a peculiar power to whatever they touch. In the sacred ceremonies it is to these first rays that the pipe is offered to the east. The movements of the man who presents the pipe are with the body bent forward and the eyes fixed as on a low horizon line. The next sentence of the quoted passage speaks of the vying of birds. Contests between birds in song and strength of wing are the subject of many an Indian folk-tale. All these native beliefs and fancies are recalled in the "Story of the Wren," from which the sentences are cited—a story that belongs to a religious rite, and which is told by the priest to the initiated in order to inculcate certain ethical teachings. In like manner, did space permit, could be explained every figure of speech and each native fancy used in the stories given in the little book.

An Indian language lends itself to picture-making with a wealth of detail that almost defies translation into our more staid English speech. A single word will call up a scene, or describe an act, which, to give with equal force in English, would require a sentence, or even more than one. The Indian's mental attitude toward nature and his social surroundings is reflected in his language, his customs, and his cults. This attitude is so unlike our own that it has led, and still leads, to many misunderstandings between the two races.

A word as to the presentation of the music in the book. For economical reasons the aria was not printed upon a separate staff, but, as is stated in the preface, "the melodies are exactly as sung by the Indian." The accuracy of the published transcription has been tested by competent musicians by comparison with the graphophone records taken from the Indians themselves. The melody, as is generally the case in written music, is the upper line of notes in the treble staff. Any one can play or sing this aria, leaving the harmony out, if he chooses to do so. An aria unsupported by chords is not intelligible to the general reader, whose pleasure and information were in mind while preparing this book. There is another reason for publishing the songs as they appear, and that is, that the Indians themselves prefer the simple accompaniment as given, when the songs are made objective by being played upon an instrument—a curious and interesting fact, since the Indians, as stated in the book, always sing in unison.—Yours respectfully,

ALICE C. FLETCHER.

PEABODY MUSEUM, CAMBRIDGE, MASS.,

ROMAN EXTORTION.

TO THE EDITOR OF THE NATION:

SIR: In the interest of the intelligent and educated travelling public, annually spending money freely in Rome, I write to protest against a form of annoyance which has recently taken on more serious proportions than ever. Years ago, when visiting the Vatican, it was understood that at various barriers were stationed liveried menials who had to be paid *pour enfoncer une porte ouverte;* and to this custom, particularly as the collection was really a private one, the traveller commonly acceded with more or less grace. But to-day, in such *public* collections as the Museo Nazionale delle Terme, and still more markedly in the Museo Kircheriano, it has become almost impossible to obtain a moment of quiet for thought and study—even after paying the regulation entrance fee. The stranger, particularly if he be alone and happens to have deliberately chosen, for his own purposes, an hour when few visitors are likely to be present, is simply dogged from room to room by a *custode* in creaky boots; this under the pretence of seeing that objects under glass are not handled, or that the student shall not adopt the prevalent Italian practice of using the floor, as Thackeray said, for an "instrumentoon." Three days ago, at the Museo Nazionale, a party of perfectly competent American travellers were so persecuted in this manner that one of them offered the tormentor a franc to hold his tongue and stand still; and the offer was accepted.

To mere remonstrances the invariable answer is, "Ordinato dal Ministero." Now it cannot be that any department of the public service should decree the watching and harassing of a solitary stranger as though he were a potential thief. The more obvious explanation is that these servants simply lie in wait for the *forestiere*, and, in spite of the still more formal regulation, "Sono vietate le mancie" ("Tips forbidden"), occupy their idleness and ingenuity in devising schemes to tap him. A favorite device consists in keeping exact step with the visitor. The latter moves two paces, the *custode* takes two. The stranger moves a quarter circle round a show-case, and the other radius follows with military precision. If the student sits down for a moment to consult an authority, the heavy-footed guardian tramps noisily up and down till all possibility of concentrated thought has vanished. It might be well for the authorities to employ only deaf-mutes, shod with felt. Fortunately, the two museums on the Campidoglio, the Vatican galleries, the Accademia S. Luca, and most of the private collections are free from this nuisance. It would give the writer of this letter the greatest gratification to see it obtain a wide publicity.

A. U.

ROME, June 20, 1900.

"ACHILLES' WRATH."

TO THE EDITOR OF THE NATION:

SIR: The oldest copy of Pope's Iliad in the Astor Library is catalogued as of the original edition, 1715-20. As to volumes ii.-vi., this is probably true. Volume i. has been recently rebacked, but the old side-covers are exactly like those of the other volumes. Inside its cover is pasted Pope's autograph receipt for two guineas from Lady Massam, and a pencilled note on the title-page asserts that this is her Ladyship's copy. That very title-page, however, is plainly dated, not 1715, but 1738.

This Astor copy of volume i. does not contain at all the list of original subscribers (in which Lady Massam duly appears). Some of the plates are, I think, also missing. The paging runs not to 318, as in the edition of 1715, but over 380. Yet in general appearance it is entirely suited to its companions.

Pope's publisher, Bernard Lintot, died in 1736. According to the 'Dictionary of National Biography,' after his retirement to the country in 1730 his son Henry's name regularly appears associated with the father's. But the Astor first volume reads: "Printed by W. Bowyer for B. Lintott, and sold by" —— two other booksellers, not by the Lintots at all. Yet these are evidently not old copies or sheets purchased from the Lintots, as the paging alone proves.

Permit me to ask your correspondents for further information as to this edition, or as to other authorized editions issued in Pope's later lifetime. The familiar couplet from which my caption is taken does *not* appear in this copy of 1738. It does appear in the edition of 1750. Can it be positively ascribed to Pope—*or to Warburton?* If Pope had not revised the couplet in 1738, it seems unlikely that he did so between that date and his death in 1744. The change was made by some one who missed the word "unnumber'd" (μυρία), and was capable of the flat tautology, "Heavenly Goddess." Some, I am sure, will prefer Pope's original version:

> "The Wrath of *Peleus'* Son, the direful Spring
> Of all the *Grecian* woes, O Goddess, sing!"

Another couplet, i., 452-3, may aid in the discussion. Pope wrote in 1715:

> "Supported by the chiefs on either hand,
> In silence past along the winding strand."

There are few more graceful passages, and Pope in a note intimates his satisfaction with his own "numbers." But the "vulgate," from 1750 onward, reads:

> "Past silent, as the heralds held her hand,
> And oft look'd back, slow-moving o'er the strand."

The gasping *h*'s in the former line, we hope and plead, should rather from the pedant pupil's pen proceed.

There are several minor changes, also, indicating conscious revision, but none, at least in Book I., of great weight or interest. In every case the 1738 copy agrees with the text of 1715, a good specimen of which is in the Lenox Library. Of course, there may be plenty of positive evidence in existence—even Pope's autographic corrections. Certainly, the authorship of what is perhaps the most familiar heroic couplet in the language is a literary question of importance.

WM. C. LAWTON.

ADELPHI COLLEGE, BROOKLYN, June 28, 1900.

INTRINSECATE.

TO THE EDITOR OF THE NATION:

SIR: Has not your correspondent, "F. H.," overlooked the somewhat curious point that the use of this word by some contemporary poet, or dramatist, was one of the factors resulting in the so-called Elizabethan poetomachia? Marston, in the address To Those that seem Judicial Perusers, prefixed to the "Scourge of Villainie" (1598), attacks some contemporary in this fashion:

> "Yet when, by some scurvy chance, it [my book] shall come into the late perfumed fist of judicial Torquatus (that like some rotten stick in a troubled water hath got a great deal of barmy froth to stick to his sides), I know he will vouchsafe it some of his new-minted epithets (as *real*, *intrinsecate*, and *Delphic*), when in my conscience he understands not the least part of it."

Elizabethan poetic and dramatic literature contains many allusions testifying to familiarity with the writings of Macchiavelli. Marston's allusion has generally been held to have been intended for Ben Jonson, who uses all three words in his early plays; but the latest, and, in many respects, best authority on this topic declines to concede that Jonson is pointed at, although Mr. Small failed to give any authority for his assertion, contenting himself with saying that the three words were widely current at that particular time. (See 'The Stage Quarrel between Ben Jonson and the so-called Poetasters,' by Roscoe Addison Small, Breslau, 1899.)

C. A. H.

July 6, 1900.

Notes.

George Barrie & Son, Philadelphia, are to pictorialize the Paris Exhibition in the manner of four previous international exhibitions. The volumes devoted to the painting and sculpture of to-day will be in charge of Mr. William Watson, while M. André Saglio of the Musée Cluny will edit the volume on the centennial and retrospective collections in the Grand and the Petit Palais. M. Victor Champier will deal with the renaissance in the industrial decorative arts. One whole volume will be devoted to the architecture and life of the Exposition. A series of more than 500 intaglio plates will furnish the illustrations. A prospectus of the undertaking may be had at the firm's Paris office, No. 19 Rue Scribe.

Henry T. Coates & Co., Philadelphia, have in press 'The Weird Orient,' Eastern tales by Henry Iliowizi.

McClure, Phillips & Co. announce 'Abraham Lincoln—His Book,' a facsimile of a scrap-book of clippings made by Lincoln for one of his supporters in the contest with Douglas for the Senatorship in 1858, as containing the substance of all he had ever said on the subject of negro equality. It was to be, and was, used to prevent his opponents' making capital out of his alleged views on this subject. In the fall the same firm will publish 'Donegal Fairy Stories,' compiled by Seumas Macmanus.

'The Life and Writings of Thomas Jefferson,' by S. E. Forman, Ph.D. (Johns Hopkins), is in the press of the Bowen-Merrill Co., Indianapolis.

Sampson Low, Marston & Co. will market 'The *Times* History of the War in South Africa,' in five royal octavo volumes, fully illustrated with portraits, maps and plans.

A French translation of Professor Ashley's 'English Economic History' has just been published by the Paris house of Giard & Brière, in their "Bibliothèque Internationale d'Économie Politique," edited by M. Alfred Bonnet. The first volume is the work of M. Bondois of the Lycée Buffon; the second of M. Savinien Bouyssy.

'Foreign Missions of the Protestant Churches' (New York: Eaton & Mains), by Stephen L. Baldwin, D.D., is a handbook containing brief outline summaries of the work of about sixty missionary societies in this country and Europe, with some historical data. The introductory chapters treat of missions in general and the duty of Christians in respect to them. According to the statistical tables, there are now, in round numbers, nearly twenty thousand stations manned by more than twelve thousand missionaries and sixty-two thousand native assistants, to whose support the various churches contribute more than fifteen million dollars.

'The Reading of Speech from the Lips' (Providence, R. I.: Akerman Company), by Mary Hepburn Parsons, is a practical guide intended particularly to aid the deaf in teaching themselves the art of lip-reading. It is chiefly made up of lists of carefully selected words, with descriptions of the methods of forming the consonants, vowels, prefixes, and suffixes. The learner is warned that expertness is acquired only by long and constant practice, but that "two months should show very marked progress."

In 'The Hygiene of Transmissible Diseases' (Philadelphia: W. B. Saunders), Dr. A. C. Abbott has put together in an interesting and instructive form the main facts regarding the causes, modes of dissemination and infection, and also the prevention and general management, of more than thirty communicable diseases. Scarlet fever, measles, diphtheria, typhoid, and others come to mind at once, but without actually counting up the list one hardly realizes that there are so many. Some are limited to certain parts of the world, some seldom found except in certain parts. Most of them are to a greater or less extent preventable. Sex, age, race, occupation, density of population, heredity, season, and bad sanitation all have their influence as predisposing causes. Some are checked by isolation, disinfection, vaccination, and protective inoculation, and by antitoxic treatment, and there is hope that the scope of these last may become larger and larger. Bacteria in their various forms, though little known a few years ago, may now be considered almost as household pets. Terrible as are their baneful effects in certain cases, it must not be forgotten that the majority of them are benefactors of mankind. They are nature's scavengers, and change dead organic matter into food for plants which again feed man, and in other ways lead to the production of chemical substances of great use to the world. To employ such bacteria as are beneficial, and to repress and destroy such as are harmful, is a worthy, and to a large extent, a successful endeavor of mankind.

Two years ago this month the ill-fated and evil-manned *Bourgogne* went to the bottom in collision in a fog off Sable Island. Among the women who perished (and only one was saved) were the wife and unmarried daughter of Judge John F. Dillon, sailing from this port for France. A privately printed volume from the De Vinne Press, rich in portraits, and consisting mainly of letters from Mrs. Anna Price Dillon, is the husband's recent monument to his wife. A slight connecting narrative binds together the self-revelation and chronicle of the letters, of which the aspect is almost wholly personal and domestic, though Mrs. Dillon was public-spirited and interested in charities, libraries, and the cause of the higher education for women. The memorial is valuable as depicting a type of American character whose charm and energy are imperfectly shown in letter-writing. The Eastern-Western life of both husband and wife, and of the wife's parents, is also typically American.

In the July issue of the *Pennsylvania Magazine of History and Biography*, Mr. Richard Meade Bache discusses the charge brought by Mr. John Bigelow against William Temple Franklin of tampering with his grandfather's Autobiography in the publication of it. Mr. Bache concludes that the exchange of the autograph of the Autobiography "for what was ostensibly a perfect copy of it held by Mme. le Viellard" was innocently made by Temple Franklin, without collation of the two, and perhaps for the sake of fair printer's "copy." What he gave thus uncritically to the world was "almost the whole of the work as revised and corrected by Franklin himself"; what Mr. Bigelow gave, after the recovered MS., was "only a brief addition, apparently left by him [Franklin] without a copy."

The *Geographical Journal* for June opens with a sketch, by the Director-General, of the work of the Ordnance Survey during the past twelve years, accompanied by a series of diagrams. Much of this has been a resurvey, rendered necessary (especially in Yorkshire and Lancashire) by the "immense development of towns and urban districts." An account of a recent exploration of the Bermejo River in northern Argentina, which follows, is noteworthy as showing the retrogression of this region during the past few years. The sites of nearly deserted towns and posts were passed, and of an abandoned colony with all its habitations in ruins, and its once valuable machinery scattered about the long grass. Cultivation of every kind seemed to have ceased, "although anything of a semi-tropical character will grow—sugar-cane, castor-oil plant, tobacco, and the like," besides maize and vegetables. The cause appears to have been lack of means of transport and the want of a market. The character of parts of western China is shown by the remark of Mr. Amundsen in his description of a trip through Sechuen, that "a day's journey will often take the traveller no farther than he can call back to his last night's resting-place, traversing the deep valley between having occupied all his time from daybreak." Some of these valleys are very fertile, yielding three crops a year of barley, wheat, Indian corn, and buckwheat, the hills being covered by luxuriant pine forests. Sir Martin Conway contributes some curious extracts from manuscripts of the seventh century, describing the whale fishery in the sea of Greenland off the coasts of Spitsbergen. We remark finally an illustrated notice of the memorial—an obelisk of concrete (in the absence of suitable stone in the region) twenty feet high and surmounted by a cross—to Dr. Livingstone, to be erected on the site of the famous tree beneath which his heart was buried, and on which his native followers carved an inscription.

A new Klondike in Lapland is a possibility, according to M. Ch. Rabot in the *Tour du Monde*. He bases this belief on the fact that the geological conditions of the two regions are analogous, and that gold has been found for many years in the valleys of some of the rivers flowing into the Arctic. The sand of a tributary of Lake Enara in Finnish Lapland, he affirms, is richer than that of California or Siberia, a cubic metre yielding three and a quarter grains of gold. All efforts to find the mother rock have been unsuccessful hitherto, but such has been the success of the prospectors that machinery for washing gold will be set up this summer in the Norwegian river, the Alten-elf. M. Rabot also says that he has found fragments of diamonds on the Pasvig, the stream which forms the frontier between Norway and Russia, "and the only diamond-bearing region known in Europe."

In striking contrast to the great universities for the building up and keeping up of which enormous sums are spent each year, especially in this country, the old and once famous seat of learning at Würzburg on the Main is actually running down for want of funds. A falling off in the number of students—four hundred in the last ten years—equal to that in all the German universities combined, and this loss almost entirely in the one department upon which the fame of the University mainly rested, the medical, leaves the institution in a sad predicament. Various explanations of this retrogression, by no means flattering to the faculty and administration, have of late been furnished by the German press. But, from discussions in the Bavarian Diet, it appears that the discouraging condition is, in the main, due to the simple fact that the University of Würzburg lacks some of the essential appliances of a modern medical school, such as suitable hospitals and clinics; in short, that what is needed is funds, which the Government has failed to supply.

The new annual report of the youthful but vigorous Orient-Gesellschaft gives the particulars of the discoveries made by Dr. Koldewey and his assistants in the old *Kasr*, or castle ruins of the city of Babylon. Over 5,000 glazed and colored bricks, once a part of the east wall, have been unearthed, and these placed together show the pictures of white lions with yellow manes and yellow lions with green manes. The expectations of finding documentary data for the political history and civilization of ancient Babylonia have not been disappointed. A sculptured representation of the Babylonian deities contains a long inscription of considerable importance in this direction. It has not yet been examined in detail. A stele representing the Hittite god of thunder and lightning, with a Hittite inscription of six lines, is a valuable addition to the meagre list of Hittite inscriptions secured. Its contents evidently are of an historical nature.

The St. Petersburg *Herald* reports the systematic robbery of valuable antiquities from the Transcaucasian districts, especially of tablets with inscriptions, which have been sold abroad. These districts are rich in material of this kind dating back to pre-Christian times, the most important being inscriptions with the names of about twenty-five czars of Van, which they had made as memorials of their conquests. Recently one of these, at the foot of Mr. Ararat, with the inscription of Czar Menna, in which his virtues are reported, disappeared. The Chairman of the Moscow Archæological Society, Countess Uwarowa, reported that this inscription had been broken out of the rock and taken abroad.

The Italian Ministry of Education has ordered that the examination and publication of the papyri taken from Herculaneum and deposited in the museum in Naples be resumed after an interval of many years. The difficult task has been intrusted to Prof. Emilio Martini. Of the collection of 800 papyri found in 1752, only about 200 have been examined.

—Though less than forty members were present at the thirty-second annual meeting of the American Philological Association at Madison, Wis., on July 3-5, the interest in the meeting was well sustained, and the programme of thirty-one papers was unusually good. Five sessions were held. At the evening session on Tuesday, the President of the Association, Miss Abby Leach of Vassar College, delivered a scholarly address on "The Athenian Democracy in the Light of Greek Literature." By frequent and apt quotations from the poets, orators, historians, and philosophers of Athens the speaker gave an admirable picture of what the Athenians conceived democracy to be. The other sessions were devoted chiefly to the reading of papers, with some informal discussion. Professor Hale of Chicago answered affirmatively the question "Is there still a Latin Potential?" Professor Hempl of Michigan discussed at some length "The Psychological Basis of Word Order," and Professor Hendrickson of Chicago explained "The Technique of Literary Characterization in Dionysius of Halicarnassus." The paper on "The Sources of the Germania of Tacitus" by Professor Gudeman of the University of Pennsylvania gave evidence of the author's critical acumen. Two papers of unusual worth were in the field of Roman religion, one of which, by Professor Carter of Princeton, was on "The Cognomina of the Goddess Fortuna." The most important piece of business transacted at any meeting for years was the accepting by the general Association, on terms of close affiliation, of the Pacific Coast Philological Association, which was formed last winter and which held its first meeting in December. The general Association receives all fees from the branch Association, and in return pays the local expenses of its meetings and sets aside about twenty pages of the Transactions for suitable papers presented by the Pacific Coast Association. The Executive Committee of the general Association passes upon the fitness of the papers for publication. The next meeting of the Association will be held with Harvard University in July, 1901. The newly elected officers are: President, Professor Platner of Western Reserve; Vice-Presidents, Professors West of Princeton and C. F. Smith of Wisconsin. Prof. Herbert Weir Smyth of Bryn Mawr was re-elected Secretary and Treasurer. The Executive Committee consists of these officers and Professors Fowler of Western Reserve, Hempl of Michigan, March of Lafayette, E. T. Merrill of Wesleyan, and W. A. Merrill of California.

—'The History of Lord Lytton's Indian Administration,' by Lady Betty Balfour (Longmans), is a description, and also in part a vindication, of the Asiatic policy which was pursued by Great Britain from 1876 to 1880. The poetical efforts of 'Owen Meredith' have been received with more favor in this country than in England, but the author's career as Viceroy and Ambassador is less familiar. The second Lord Lytton was selected for high office by Disraeli at a time when the general public knew little about his political capacity in one way or another. He took kindly to his chief's anti-Russian views, and carried them out faithfully during his term of office in the East. On p. 424 of the present volume will be found a letter which reflects the degree of Lytton's attachment to the Earl of Beaconsfield, and the whole course of his Indian régime must be considered in the light of that relation. It will be remembered that prior to 1876 the attitude which had been maintained towards Russia by British Prime Ministers and Indian Viceroys was that of Lord Lawrence. Every one dreaded the advance of Russia and her possible encroachments upon Afghanistan, but the idea of forcing a protectorate, whether friendly or not in form, upon the northern tribesmen had not been accepted by British officials. The appointment of Lord Lytton inaugurated that "forward policy" on the northern frontier of which Disraeli must be called the author, and of which Lord Roberts became the military agent. The principal topics which must come up in any book on India under Lord Lytton are the Delhi Assemblage of 1877 (following the assumption of the Imperial title), the famine of 1877, the Afghan troubles of 1878-80, and the general question of finance. Lady Balfour excludes family and personal matters with great strictness, and relates her father's acts largely through his own correspondence. She certainly proves that he took his task to heart, and worked at it with enthusiasm. According to the original plan, Sir John Strachey was to have written the record of Lord Lytton's life in India. Though he could not eventually do so, the memory of his friend has not suffered so much as might have been expected from the substitution of any other person. Lady Balfour's scheme of portrayal is well suited to the requirements of the case. She has used documents of the first value, indeed has constituted herself the editor of those letters and papers which most completely give Lord Lytton's point of view. The result is not merely a monument of personal devotion, but a work which must be consulted by all writers on the subject of Anglo-Russian rivalries along the northern frontier of Afghanistan; a region which, despite "scientific frontiers," may still be called debatable.

—Ever since Kant, philosophers have been telling us a great deal about the Unknowable, and now scientists in their turn seem to be prepared to deluge us with a mass of facts about 'The Unknown.' Such, at least, is the impression produced by M. Flammarion's book, which, under this title, has been translated and published by Harpers. M. Flammarion is not a philosopher, but a distinguished astronomer, and the "unknown" facts he describes are those which form the subject-matter of "Psychical Research," being mainly narratives of "telepathy," apparitions of the dying, clairvoyance, veridical dreams and premonitions. He may certainly be congratulated on having produced a compact mass of stories, many of which are excellent, especially those in the preliminary chapter on incredulity, describing how scientific dogmatism has often egregiously stultified itself. How far M. Flammarion's "facts" can be held to go towards proving the immortality of the soul is another question, to which the answer will probably vary according to the bias wherewith the question is approached. It must be noted, however, that though M. Flammarion makes copious additions to the recorded evidence on the subject (in a few months an appeal in the columns of the *Annales Politiques et Littéraires*, and of a couple of other journals, brought him no less than 1,130 accounts which he considers worthy of note!), their quality as yet leaves much to be desired. Thus, of the cases of telepathy with the dying which he relates, only about a third appear to rest on strictly first-hand evidence (though with some additional trouble this proportion might doubtless have been largely increased). Moreover, on the whole, the stories, collected as they were mainly from a French public, seem to evince, as might perhaps have been expected, a sense of the value of evidence inferior to that shown in the Anglo-American stories published by the Society for Psychical Research. Still, there is no denying that apparently it is far from being true that such stories circulate only as unauthenticated hearsay; as soon as a serious demand is made for them, they can be supplied in abundance, and it would seem that, with the gradual growth of toleration for ghostseers, the quality of the evidence also tended to improve. But their quantity and quality alike will have to improve still further before science can presume to be in a position to pronounce with confidence of what truth these curious experiences are an adumbration. It is a pity that M. Flammarion's book is not provided with an index, and that in consequence of inadequate proofreading the proper names in it are thoroughly untrustworthy and often grotesque.

—The newest biography of Goethe, by

Prof. Georg Witkowski of Leipzig (New York: Lemcke & Buechner), produces in the main an agreeable impression. It is no small merit in these times that a German *Goethe-Forscher* should contrive to tell the story of his hero's life and say his critical say in the compass of one volume of 264 pages, surrendering much of his space withal to illustrations. A few years ago it looked as if the biographic art, as practised by German scholars, were tending toward a hypertrophy of thoroughness. Two different lives of Schiller, for example, were begun upon a scale which, should the works ever be completed, will require only a little less time in the reading than the events narrated took in happening. We believe, too, that a colossal biography of Goethe, to be done by a sort of literary syndicate, has been in contemplation. Witkowski has performed his task all alone, finished it up, published it complete in one volume, and is still a youngish man. We congratulate him, and hope that his achievement may be an omen of better times to come. Of course he has had to practise the Goethean doctrine of renunciation—to leave out much that he knew and would have liked to tell; but this will hardly be missed except by his fellow-biographers, who, to be sure, are becoming a pretty numerous portion of the German public. If his book has not distinction of style, like Grimm's, it is at least well written, sane, and up to date. The numerous illustrations—there are 155 of them in all—are as a rule well chosen, unless the objection be made that a good many of them are already very familiar to readers of Goethe literature.

—The fourth volume of Professor Fredericq's monumental "Corpus Documentorum Inquisitionis Neerlandicæ" (Ghent: Vuylsteke), comprises the period from 1514 to 1525. Ten pages suffice to cover the years up to the spread of the Lutheran heresies to the Low Countries, and the rest of the five hundred pages are the record of the fruitless endeavors of magistrates and inquisitors to check at its inception the progress of religious revolt. The material which the industry of Professor Fredericq has collected from all sources gives us a vivid picture of the spiritual exaltation of the time, and of the constancy with which the protomartyrs of the Reformation faced death in its most abhorrent form rather than forego their right to interpret Scripture after their own fashion. One of the most curious documents is the reprint of a rare tract by Willem Gnapheus, giving the examinations by the inquisitors of Jan de Backer of Woerden, a priest who had embraced Lutheranism, and taken to himself a wife. The disputations between him and his theological judges, in which, of course, he always comes off triumphant, are interesting specimens of scholastic digladiation, and manifest, moreover, how earnestly the inquisitors desired to make converts rather than victims. De Backer, however, was obdurate, and was burned at The Hague, September 15, 1525, after being humanely strangled before the pile was lighted. This mercy does not seem to have been general, for of two Augustinians, who were burnt at Brussels, July 1, 1523, we are told that they recited the creed and sang Te Deum until their voices were choked by the flames. Miracles, it seems, were not lacking to prove the truth of the doctrines for which these enthusiasts perished, for when the Carmelite Bernhard was burnt at Mechlin in February, 1525, it is related that he was thrice thrown on to the blazing pyre, when the flames were each time suddenly extinguished. He was then knocked on the head with a hammer, and the corpse was again thrown into the fire, when the flames were again smothered and the body disappeared—translated to heaven, as his disciples piously averred. Students of the period will find Professor Fredericq's volumes indispensable, for they present, in an accessible form, an enormous amount of important material, much of which is from inedited sources.

CROMWELL AND HIS PARLIAMENTS.

Oliver Cromwell and the Rule of the Puritans in England. By Charles Firth, M.A. Ball. Coll., Oxford. [Heroes of the Nations Series.] G. P. Putnam's Sons. 1900. Pp. xiii, 496.

What does Mr. Firth's 'Oliver Cromwell' add to our knowledge of the Protector? This is an inquiry which at the present day may fairly be asked with regard to any new life of Cromwell. As regards Mr. Firth's 'Oliver Cromwell and the Rule of the Puritans in England,' it suggests an obvious and very satisfactory answer. Mr. Firth has explained more clearly than any of his predecessors the true relation between Cromwell and his Parliaments, and has thus solved one at least of the many problems presented by the career of the great Puritan statesman.

For an enigma there assuredly exists. Why was it that Cromwell, whose sense and moderation distinguish him from an ordinary fanatic and from a commonplace despot, could neither dispense with, nor act with, any Parliament whatever? He was, throughout the contest with the King, the defender and the servant of the Long Parliament; he was anxious to maintain the principles of the Constitution; he more than once risked his influence with his soldiers in his successful effort to extort from them obedience to the Long Parliament. Yet he himself dissolved the Long Parliament by force, while in his own eyes such legal authority as he possessed seems to have been derived from his appointment as General by the Parliament which he destroyed. He convoked a Parliamentary Assembly which represented the most earnest Puritanism of the time, yet Cromwell and this Assembly of eminent Puritans could not act together, and the Little Parliament was induced or compelled to surrender its authority into Oliver's own hands.

He next constructed, or sanctioned the construction of, an elaborate Parliamentary Constitution, full of checks and balances, and comparable for the apparent ingenuity and skill of its provisions with the Republican Constitution of the United States or of the modern Swiss Confederation. A Reformed Parliament, as we should now term it, was convoked under the Instrument of Government. Scotland and Ireland were for the first time represented at Westminster. The Instrument of Government became the supreme law of the land. It looked at first sight as if, under the Constitution of 1653, the Protector and his Parliament might work together amicably enough. The majority of its members were Presbyterians or Moderate Independents. The House (for the Parliament consisted of one House only) was fully prepared to accept Cromwell as head of the State; but the House would not accept the Constitution, and Cromwell, though he offered a compromise which would have greatly extended the authority of the Parliament, was determined to maintain the new Constitution, and rapidly dissolved the very Assembly which he had convened.

In 1656 the Protector summoned a second Parliament. He was pressed by many advisers, and was at last asked by the House itself, to assume the name and office of King. He hesitated, he used vague and ambiguous expressions, but at last he rejected the crown, while allowing an amendment of the Constitution which, by the creation of an Upper House and other changes, approximated to the ancient monarchical constitution of England. But, under the amended Constitution which gave Cromwell a legal and acknowledged position, the Protector was as far from establishing real harmony between himself and the Parliament as under the original Instrument of Government. The Constitution of 1658 was no more workable than the Constitution of 1654. On February 4 he declared that all these divisions tended to nothing else but the playing of the game of the Stuarts, and dissolved the Parliament. On December 2, 1658, the Protector died. What, asks a student, was the real meaning of Cromwell's Parliamentary policy? Why could he not do without a Parliament? Why could he not act with a Parliament?

Mr. Firth's pages give a reply which is at once intelligible and, we believe, final. Cromwell neither could nor would dispense with a Parliament because he shared, and honestly acted upon, the conviction of English patriots that one main object, and certainly the chief justification, of resistance to the crown was the maintenance of English liberties; and the liberties of Englishmen were, to the patriots of the seventeenth century, absolutely bound up with the existence of Parliamentary authority. This is a fact which writers like Carlyle may conceal from themselves and their readers under clouds of misty rhetoric, but which no candid student of the past will venture to deny. To imagine that Cromwell or his followers, would, after waging war for the Parliament against the usurpations of the crown, consent to abolish representative government, is as idle as to suppose that the Whigs of 1688 would have consented to found a monarchical despotism, or that Washington would have liked to proclaim himself King of the Thirteen Colonies which had asserted their independence rather than acquiesce in taxation without representation. And if Cromwell's conscience had not forbidden, his sagacity would have rejected the attempt to establish despotism of any kind in England. The denial to the English people of the right to representation would have made the Stuarts the representatives of legality. Even as it was, the Restoration took place because it appeared to be the triumph of the Parliament and the law over the lawless despotism of the army.

The reasons why Cromwell could not act with any Parliament are complicated; yet, under Mr. Firth's treatment, become sufficiently clear. Something must be attributed to the defects of the Protector's character. His vigor and his insight were balanced by a curious impatience, as also by a want of foresight. He saw with infinite clearness what lay before him. He acted, when once his mind was made up, with crushing decision. But he did not look far ahead. He was a good deal more of a soldier than a Parliamentarian. He made the kind of mistakes which we may feel pretty sure would never have been committed by Pym: he cut through knots which it would have been wiser to untie. Thus Cromwell, it is perfectly plain, saw and felt that the Long Parliament was the last depository of legal authority. This sentiment troubled him at the very moment when he dissolved the House, yet he did not act upon his conviction, as would a trained Parliamentary leader. He did not in practice draw the inference that, at any cost of trouble, he must induce or compel the remnant of the Long Parliament to sanction and thus legalize a new Constitution.

It is easy, however, to exaggerate the effect of Cromwell's personal faults. Mr. Firth brings out clearly the fact that Cromwell's position was a false one. He pursued two different and at bottom inconsistent ends. "To understand," writes Mr. Firth, "what Cromwell's political aims were, it is necessary to inquire what he meant when he spoke of his discharging his duty to *the interest of the people of God and this Commonwealth.*' The order in which he places them is in itself significant. First he put the duty to a section of the English people; last, the duty to the English people in general." In other words, his aim was first to promote the cause for which the Independents had struggled, which in Cromwell's mind meant the cause both of religion and of toleration; and next, the interest of the English nation. To state the same fact in more modern terms, while he was the leader of a party, he was also the real governor of the nation; and he put the interest of the party, or rather the cause for which the party struggled, before the interest, or at any rate before the wish, of the nation. To Cromwell, indeed, the interest of the people of God and the interest of the nation were two distinct but by no means irreconcilable things. He hoped and endeavored to obtain a Parliament which should be equally concerned both for the one and for the other. But in this he failed and was doomed to fail. The Barebones Parliament did consider the interest of the people of God, but did not in the least understand the interest of the nation, and every other Cromwellian Parliament, the more nearly it represented the nation, the less it represented the limited body of men who seemed to Cromwell, and perhaps rightly, to be the salt of the earth, and to have really at heart the cause of religious freedom. But to him the liberty of the people of God remained more important than the civil liberty and interest of the nation, while no Parliament at all worthy of the name would accept the permanent limitation of the sovereignty of the people to the Puritan minority whom Cromwell termed, and held to be, the people of God.

Is it, however, absolutely certain—though here, it must be added, we leave the guidance of Mr. Firth and enter on the field of conjecture—that Cromwell did not in his mind anticipate a solution of the difficulties constantly arising between him and his Parliaments, which might really have been attained had Providence granted to him ten years more of life? Did he not at the bottom of his heart hope that, as a Puritan *King*, he might at once revive the old constitutional monarchy and secure the interest of the people of God? The assumption of the crown was, in the eyes of every lawyer—and the influence in the England of the seventeenth century of legal conceptions could hardly be exaggerated—the return to well-understood Parliamentary Constitutionalism; and the existence of a Cromwellian dynasty would have been an adequate security for the maintenance of Protestantism, and of at least as much religious freedom as then existed in any European State. Cromwell, it will be suggested, himself declined the crown, and therefore did not intend at any time to assume it. It is, however, possible that, without any dishonesty on his part, he looked forward to that change in outward circumstances which he would have termed a dispensation of Providence, and which a modern statesman would describe as a development of public opinion. The peril which Cromwell had to avoid was a collision with the hotter spirits of the army, which might excite civil war. But this danger was one which lessened year by year. In ten or even in five years, many of the sterner zealots would have died off or left the ranks. A general such as Monk, whom Cromwell significantly enough kept constantly in command, was ready to support the Protector and his descendants. There is nothing wild in the notion that the soldiers who in 1660 acquiesced, though we may assume reluctantly, in the return of the Stuarts, would five or six years earlier have easily tolerated the accession of Oliver to the throne. There was nothing at any rate irrational in the idea that Monk, and men like him, who did, in fact, restore the hereditary King, might have even more readily restored, under a new dynasty, the ancient monarchy of England. The most rational explanation of Cromwell's later policy is that, for the sake of the very people of God, he hoped, or even expected, that Providence would at last place the crown upon the head of the one man capable of reconciling the interest of the good cause and of the nation.

Liberty in the Nineteenth Century. By Frederic May Holland. G. P. Putnam's Sons. 1899.

Mr. Holland's book has more the effect of an aggregation of chapters than of a connected whole. No one would go to it for information, considering how much looseness of statement there is in it. At times there seems to be a rhetorical aversion to the concrete fact, and for the names of individuals we have ingenious circumlocutions. We read in one place of Theodore Parker's "successor," as if he did not have several. It is hardly fair to smirch them all as defenders of Russian despotism. Sometimes we have a page that might be the emptyings of a notebook rather than a piece of coherent writing. It should be said that there is a "List of Dates" at the end which makes the effect of the book less indeterminate, upon the whole, than it would otherwise be.

The first chapter, "Napoleon and his Work," is inspired by a well-considered and quite absolute distrust of war. Jefferson's embargo is the only American incident of the chapter, and Mr. Holland's wholesale condemnation of that measure is in keeping with his general dislike of Government interference and protection. Chapter ii., "Fruits of Peace," covers a good deal of ground. Robert Owen's experiments afford Mr. Holland his first opportunity to attack Socialism, and he makes the most of others as they turn up. At this point we come upon what is unquestionably the leading inspiration of his book. It is personal rather than political liberty that engages the writer's interest. Free speech, free publication, free Sundays, free trade—these are the ideas that quicken his enthusiasm. A free Sunday raises it to its highest pitch. To this subject he returns oftener than to any other, and generally his heart is soft as wax to those who have opposed restrictive Sabbath laws. Only Garrison's Sunday-reform agitation leaves him cold, but that is because his appreciation of Garrison in his entirety is below zero. In chapter iii., "Democrats and Garrisonians," the general impression conveyed is that the Democrats were the less criminal party. Mr. Holland's philosophy of what might have been is, that the Whigs might have checked the growth of slavery and have effected its final extinction in spite of the abolitionists and without a war. Speaking of the neglect of the clergy to oppose Texan annexation, he adds, "Channing died in 1842, and Parker went to Europe in September, 1843." The implication is that if Parker had remained at home, the Annexationists would have known the difference. But in 1843 Parker had preached but one good anti-slavery sermon, and all his heart and soul was in the controversy with his Unitarian brethren. In another connection Mr. Holland speaks as it if were the anti-slavery impulse that made Parker a lecturer in 1844. It was certainly not so, nor is it true that the substance of his lectures generally was the anti-slavery idea. A chapter on "Emancipation" carries on the war against Garrison initiated in the preceding. There is no perception of the unreality of the Free Soil vote in 1848, "five times as large as in 1844," but nearly twice as large as that of 1852. Mr. Holland blames the Know-Nothings of 1856 for defeating Frémont, but the fact is that most of the Know-Nothing honey went into the Republican hive. Know-Nothingism meant for Henry Wilson simply a device for disintegrating the old parties. It is significant of the working of Mr. Holland's mind that, from a vote of thanks given to Theodore Parker in Wilmington, Del., after a lecture, he argues that "abolitionism would [have] eventually become predominant in the Senate as it was already in the House of Representatives." In conclusion we are assured that emancipation might have been gained gradually and peacefully "if there had been more philanthropy among the clergy, more principle among the Whigs, and more wisdom among the abolitionists."

"Emerson and Other Transcendentalists" next come before the bar of Mr. Holland's stern discrimination. For Emerson's character he has only praise; for his doctrine, little but distrust. The criticism is made that his doctrine of virtue, as spontaneous will, was too much the reflection of his own innocence. Because all his own impulses were good and pure, he assumed all men's to be so. Few others fare so well in Mr. Holland's book as Theodore Parker, and in general his praise of him is well conceived. From Parker we pass to his disciple, Miss Cobbe, who is written of in the past tense, as if she were already dead, and whose passionate anti-vivisection crusade is imputed have implied remissness in the performance of an obvious duty.

He insists on certain elements as necessary to success in plans for his colonies. to wit: land for which irrigating water is actually known to be available; the ownership of this water and the irrigation system by the community concerned; picked colonists of intelligence and good habits; capital for the preliminary works, to be secured by a lien on the lands irrigated; coöperation in the community work; small farms, not exceeding on the average twenty acres, with diversified crops supplying family needs as well as the surplus needed for cash expenditures; intelligent leadership, and a whole-hearted backing up by the community of the leaders once chosen. In one particular only it seems to us that he has not been sufficiently explicit, and that is in relation to a market for the surplus products of the soil. In California the rapacity of middlemen has partly brought about its obvious antidote in the form of coöperative exchanges for handling the crops, but this is still less general than is to be desired, and has been enforced only after years of trial and disappointed hopes which have ruined many. Transportation charges to a market are another cardinal difficulty when railway managers follow the policy of charging "all the traffic will bear." The two difficulties of finding a market and getting to it without paying out the whole value of the crop, are responsible to a great extent for the disinclination of investors to consider irrigation colonization, and these factors are not discussed in the present volume. Doubtless settlement will proceed in about the ratio that these difficulties are favorably met. Meanwhile, the value of the book is unquestionable, and it is to be hoped it may reach the classes best calculated to profit by its revelations and advice.

The Journey of William of Rubruck to the Eastern Parts of the World in 1253-1255, as Narrated by Himself; with Two Accounts of the Earlier Journey of John of Pian de Carpine. Translated by William Woodville Rockhill, etc. London: The Hakluyt Society, 1900. 8vo, pp. lvi, 282.

The Hakluyt volume No. 4, of the Second Series, is by an American, Mr. W. W. Rockhill, Director of the Bureau of American Republics, whose long residence in Peking, associated with Chinese scholars and travellers, and his familiarity with Chinese literature, specially fitted him for translating, editing, and annotating this precious document. Sir Henry Yule had contemplated rendering into English, with copious notes, the "Itinerarium" of this worthy rival of Marco Polo, of which Sir Henry says, "It has few rivals in the whole library of travel"; but this purpose was thwarted by his untimely death. How near the indefatigable Franciscan came to passing into oblivion may be judged from the fact that his name does not occur in the great modern history of his order. Friar William was a native of Rubruck in French Flanders, but the dates of his birth and death are unknown. He is represented as a heavy man in person, and Col. Yule characterizes him as honest, pious, stout-hearted, intelligent, and keenly observant. He also says of the language of his manuscript; "Dog-latin, we fear it must be called." The first notice of the journey of Friar William was given by Roger Bacon, in 1264 ('Opus Majus,' i., 305 seq.). Hakluyt first made known the relation of his journey in 1600; and Samuel Purchas published the first complete text in 1625, calling it a "Jewell of Antiquitie."

The thirteenth was one of the most thrilling among the centuries. The tide of European enthusiasm was subsiding from the Holy Land, and in its place a refluent force began to overwhelm eastern Europe and Asia. In 1222, the Mongol broke through the Caucasus, devastating Russia as far north as Kazan; but it was in 1241 that a second invasion carried his triumphant banners into Silesia, Moravia, and Hungary, and threatened the whole of Europe. The jealousies of Pope Gregory IX. and Frederick II. gave to this threat apparently good chance of success. Within a few weeks of each other, however, both Gregory and the Mongol Emperor Ogodali expired, at once healing the politico-religious wounds of Europe and sending the Mongol chiefs with their armies to Karakorum, their capital in Central Asia. In 1243 Pope Innocent IV. promoted a general crusade against the Mongols, organized missions for their conversion, primarily, but incidentally to find out through the missionaries exactly what were their plans regarding Europe. Several missions followed in the next ten years, ending with that of William of Rubruck. All of these are included, so far as any literature exists about them, in Mr. Rockhill's translation.

The life of William became entangled in the Mongol invasion thus. He happened to be in Paris, in 1247, intending to accompany King Louis IX. on his crusade to the Holy Land. Just then Friar John of Pian de Carpine, near Perugia, and his companion Benedict, the Pole, who had already been on a mission to the Mongol chiefs, as far as Karakorum in Central Mongolia, had been sent to St. Louis, in Paris, by the Pope, to beg him to defer his crusade and to help him against the Tartars. No doubt Friar William of Rubruck met Friar John and his companions, and took from them the infection of converting the Mongols and of gathering up the scattered Christians of Western Asia.

In 1249 Friar William accompanied St. Louis to Egypt, and in 1251 was with the King in Cæsarea, when Friar Andrew of Longumel returned fom the Mongol Court, as did Philip of Toucy from a mission into southeastern Russia, and Baldwin of Hainaut, who had travelled as far as the Mongol Emperor's Court, near Karakorum, in the very focus of Asia. Thus acquainted with what was then known concerning the Mongols and their empire, Friar William was commissioned to undertake a journey of more than ten thousand miles in extent, on foot, on horseback, and in Tartar wagon-houses, to Mangu Chan. His itinerary begins with Constantinople, where he fitted out, and proceeds across the Black Sea to the Crimea, around the western and northern shore of Azov to the Don, through southern Russia to the Caspian near the Ural mouth, thence on a parallel nearly the same as that of our northern boundary to Karakorum, the Chan's capital. His residence there during six months, and all that he did and suffered, are set down with as much detail as though he had with him a stenographer. In travelling homeward William passed north of Lake Balkash to the Camp of Batu Chan, on the Volga, and, under the impression that King Louis was still in the Holy Land, made his way down the eastern shore of the Caspian to Derbent, and thence across the headwaters of the Araxes and the Euphrates to Cyprus. Greatly to his mortification, he was not allowed to carry his manuscript to the King in person, but had to remain in Antioch at the command of his superior. Thanks to faithful friends, however, the papers reached the King and were brought to light as has been stated.

The ethnological information contained in this volume, setting forth the condition of life and affairs six and a half centuries ago in Middle Asia, is of great importance at this time. It is clearly revealed therein that eastern and western Asia were intimately acquainted. Rubruck's best friend in Karakorum was a jeweller, born and trained in Paris. The details of William's narrative, replete with interest at every point, would carry us too far afield. It is with much pride that we place this piece of faithful work done by our countryman on the shelf between Rawlinson's Herodotus and Yule's Marco Polo. A bibliography of all works cited will aid the student in further research.

A Country Without Strikes. By Henry Demarest Lloyd. New York: Doubleday, Page & Co. 1900.

The experiment described by Mr. Lloyd in this little book is one which will be watched with interest by economists. We certainly owe a debt of gratitude to the author for taking the trouble to go to New Zealand and examine the situation for himself, and it is difficult not to share his enthusiasm over the condition of industrial peace which prevails in that region. Nevertheless, such enthusiasm somewhat impairs the value of the testimony of a witness, and Mr. Lloyd's account of the actual operation of what is called compulsory arbitration is not distinguished by scientific lucidity. We are obliged to read between the lines, and to supply a good many omissions, before we can feel competent to reach any conclusion; and whatever conclusion is reached must be tentative.

When we come to analyze the "Compulsory Arbitration Law," and study the decisions of the court by which it is administered, we find, as a matter of course, that the principle on which it is based is the regulation of wages and profits by Government. The statute applies only to laborers incorporated as trade-unions, and practically only to laborers working in factories. That class which is so turbulent in this country, the street-car hands, is exempted, and so are seamen and all Government employees. As the railroads are State enterprises, another troublesome element is thus unregulated. The Court has power to fine the members of trade-unions as well as employers for disobedience to its decrees. It requires employers to refuse employment to non-union laborers, provided union laborers can be obtained, and it limits the number of apprentices that may learn a trade. It fixes wages, and if any employer wishes to set up a business, he must comply with the conditions prescribed by the Court for its conduct. The effect is obviously to recreate the guild-system, under the supervision of a supreme judge. Hitherto, the experiment having been tried during a period of rising prices, the decisions having been almost invariably in favor of increased wages, and the judge having been one holding office for life, the law has worked with little friction. What will take place when prices fall, and when the office of judge becomes elective, it is impossible to predict. Possibly, by that time the advantages of conciliation may be generally recognized; and with closely limited guilds the present tranquillity may be continued. Laborers excluded from the trade-unions can find employment on the land, the unlimited supply of which in New Zealand will long insure the laboring classes an advantageous position in the industrial world.

Nature's Calendar. By Ernest Ingersoll. Harper & Bros. 1900. 8vo, pp. xvi, 270. Ills.

Mr. Ingersoll has had the idea of stimulating observation of the recurrence of natural events in the round of the year by preparing a volume in which some general account of these events is given, and a wide blank margin allowed for the reader's own notes by the side of the text. He has aimed to give a memorandum of some of the things for which the observer should be on the lookout from week to week, the text being arranged in the form of a calendar, with a chapter for each month. This he offers as a guide to study out of doors, a key to the "cycle of birth, career, death, and progeny, seed, blossom, and fruitage." The dates given refer to an ordinary season in the region about New York city. The reader is urged to make notes in the space provided for them. "In fact, if you will regard the printed part as nothing more than my beginning, and will complete it and correct it for your own locality, . . . you may find yours the better half of the book."

The basis of the book is a series of articles contributed by Mr. Ingersoll to *Forward and Wellspring* for 1899. Prof. C. M. Weed has assisted with data in regard to insect life, and Mr. Clarence Lown has contributed a photograph for each month, made in the Hudson valley, to illustrate the progress of the year. The general execution is but mediocre. The vagueness and generality of the author's remarks, though possibly suited to a popular article in an ephemeral publication, are not well adapted to teach untried amateurs to make observations of any value. In fact, the impression made by a perusal of the text is that it is neither good literature nor exact science. The amateur would gather far more valuable suggestions as to method from a reading of White's 'Selborne' than anything this volume has to offer, though White observed in a foreign country and at a period now antiquated. In short, it is another case of a good idea feebly and imperfectly worked out.

The volume is well printed, but on inconveniently heavy paper, and the "process" illustrations (originally good photographs) are poorly reproduced. There is no index, and the back of the book, for some inscrutable reason, has that collapsed appearance which is disgusting to the average bookman.

NOW READY. VOLUME I.

A HISTORY OF SCOTLAND
From the Roman Occupation
By ANDREW LANG
With Photogravure Frontispiece and Four Maps
8vo, $3.50 *net*

TO BE COMPLETE IN TWO VOLUMES.

Literature.—"He has proved master of his task; all doubt about that must be dispelled by his first volume. . . . Mr. Lang is not merely a conscientious chronicler; he excels in reviving the seeming and sentiment of the middle ages. We do not remember to have read a synthetic sketch of social conditions of any given period at once so faithful and so vivid as that of the twelfth century Scotland. . . . We have no hesitation in pronouncing the latest history of Scotland to be the most readable, and, taking account of the use that has been made of recent specialist research, the most complete."

Speaker.—"The results of Mr. Lang's labors are of great value. They are to be seen in a number of final judgments, which are of all the more importance that they seldom take the form of cocksure deliverances. . . . This book is as readable as it is erudite. It is absolutely indispensable to the reader of Scottish history."

Daily News.—"A monument of great and various learning lightly borne. . . . Mr. Lang's handling of the subject will be admired by every educated and impartial reader. . . . The Scottish Reformation, as Mr. Lang treats it, is not Scottish merely, nor even Anglo-Scottish only, but a question of European import."

Pall Mall Gazette.—"Mr. Lang is acquitting himself of this task admirably. No one now needs to be told of the fascination of his literary style, his perfect command of all the resources of our language, his clear, terse, and elegant form of expression, and the heights of facile eloquence to which, when occasion demands, he can rise. Of all this there is ample evidence in this work."

WORKS BY

THE LATE G. W. STEEVENS,

War Correspondent

FROM CAPETOWN TO LADYSMITH. 12mo, cloth, $1.25.

The publishers take pleasure in announcing that they have secured the American rights of this the last work of the late G. W. Steevens. The writer, probably the best known war correspondent of the time, has written many books of travel and many records of fighting, but to none of them will attach the peculiar and melancholy interest which can be claimed for this, his last work, completed just before he died.

It is a matter of common knowledge that the author recently died of enteric fever, a captive in Ladysmith. The march to that place and the desperate siege of it are wonderfully described, and the book will take rank among the great "adventure" writing of the time.

WITH KITCHENER TO KHARTUM. With 8 Maps and Plans. 12mo, cloth, $1.50.

"This book is a masterpiece. Mr. Steevens writes an English which is always alive and alert He fits a vivid experience with a vivid phrase, and his quick talent permits him to realize for his readers the magnificent panorama which fate has driven before his eyes. . . . The description of the battle of Omdurman reaches, we do not hesitate to say, the high-water mark of literature."—*Spectator.*

IN INDIA. With a Map. 12mo, cloth, $1.50.

"To read this book is a liberal education in one of the most interesting and least known portions of the Empire."—*St. James's Gazette.*

"Contains many brightly colored word pictures of cities and peoples, manners and customs."—*Morning Post.*

THE LAND OF THE DOLLAR. 12mo, cloth, 75c.

"One of the smartest books of travel which have appeared for a long time past. . . . Brings the general appearance of Transatlantic urban and rural life so clearly before the mind's eye of the reader that a perusal of his work almost answers the purpose of a personal inspection. New York has probably never been more lightly and cleverly sketched."—*Daily Telegraph.*

"An admirable, brief, and most intelligent portrait of America and the American of to-day, for which we may all be grateful. We do not know anything more lifelike, or in which a vivid perception of the points which best elucidate character and circumstances are better displayed. The survey is rapid, the impression keen."—*Spectator.*

WITH THE CONQUERING TURK. With 4 Maps. 12mo, cloth, $2.00.

"The most entertaining of the volumes we have had about the Ten Weeks' Campaign in the spring. . . . It gives brightly, and without any desperate striving after realism, a vivid idea of what a correspondent with the Turkish forces in Thessaly went through."—*Times.*

"This is a remarkably bright and vivid book. There is a delicious portrait of the jovial aide-de-camp, plenty of humorous touches of wayside scenes, servants' tricks, dragoman's English, and vagaries of cuisine."—*St. James's Gazette.*

EGYPT IN 1898. With Illustrations. 12mo, cloth, $1.50.

"Set forth in a style that provides plenty of entertainment. . . . Bright and readable."—*Times.*

"His keenly observant and humorous studies of men and things as he found them in the course of his comprehensive tour of exploration convey, in an agreeably condensed form, an amount of instruction that would not do discredit to a far more 'solid' and pretentious work."—*World.*

The Nation.

NEW YORK, THURSDAY, JULY 19, 1900.

The Week.

Secretary Hay has done well to make public the note of our Government to the other Powers, defining the attitude of the United States in the Chinese difficulty. This is "the new diplomacy" in one of its happier moments—publishing diplomatic correspondence, not in order to browbeat or exasperate a country with which we are in controversy, but for the purpose of taking the people and the whole world into confidence, with the object of solidifying support of a wise and humane and unselfish policy. That Mr. Hay's frankness will have such a conciliating effect we are justified in hoping. Already a favoring echo comes from England, with whose Chinese policy, so far as announced, our own is in substantial accord. It may be summed up in few words. First, protection of our citizens in China; second, hearty support of any native government which stands for law and order; third, indemnity for damage done, and guarantees against renewal of the outrages; fourth, withdrawal of foreign forces and the preservation of a "Chinese territorial and administrative entity"—to quote Mr. Hay. The policy is "hands on," to rescue and secure Americans; then at once and as resolutely, "hands off!" The hope of raising up an ally from within China is the one to which we must steadily cling. It is only common sense to look to a native government to do the immense and arduous work of policing the country. Intervening Powers could not do it one-tenth as well, or except at a cost ten times as great. The chief aim of intervention should be to find or create some local authority capable at once of fulfilling international obligations and maintaining domestic order. Mr. Hay clearly commits our Government to such a policy. In doing so he simply reaffirms the historic American position.

The Powers profess to have been entirely ignorant of the extent to which China had supplied herself with European-made guns and ammunition. Now, in the outburst of wisdom that follows the event, it is gravely proposed that the civilized nations of the world, which have brought to perfection the instruments of destruction, shall monopolize their use, and prohibit their sale to barbarians—meaning in this case those peoples of the earth less able to kill than we are. If Boers and Chinamen and Indians, Asiatic and American, can be kept from owning rifles and cannon, they will be less dangerous to the nations that want their trade or their land. But what are guns made for if not to sell? Has not German industry been reaping the benefit of the trade which all the Powers have been so anxious to develop with China? China did not wish it; we forced her ports, and she opened her country to us on any large scale only after the war with Japan revealed both to her and to the outside world how hopeless would be any attempt at resistance. Strange that we should be surprised when, compelled at the cannon's mouth to buy, she elected to buy cannon! The disconcerting promptness of his choice shows how quick was the despised Celestial to strengthen the weakest point in his civilization. But if we had let him alone, he never would have bought Mausers. If we are to develop China, we must expect to see her armed. England, with her firm grip on India, has found it impossible to keep the barbarous mountain tribes of the remote interior from supplying themselves with modern rifles. No measures which the European governments can adopt will avail to keep China from buying of the manufacturers through third parties, as long as China remains an independent Power.

So many predictions about China have been falsified that, in the attempt to save at least one prophet's reputation, there has been a revival of the late C. H. Pearson's theory of the Yellow Peril to civilization. But his idea was almost purely that of an industrial peril. Skilled and cheap Chinese and Japanese labor was to defy and destroy all competitors. Yet Pearson, though in general a neglected prophet, had one distinguished disciple. The Emperor William was so impressed in 1895 with the Yellow Peril that he turned political cartoonist for the nonce. His design, which was worked out in colors by Knackfuss, and was largely circulated in Germany, represented the civilized nations, led by the Archangel Michael, preparing to resist a Chinese dragon which was seen approaching. Even this imperial forecast, however, may be cited as first-class prophecy only in one respect—the alliance of the Powers against China. As for William's Chinese dragon, it was not a furious monster content to crunch the bones of its victims in its own lair or "sphere of influence," but an aggressive beast roaming forth in search of prey. This the Chinese dragon of real life is not. Whatever else may be said of the horrible excesses of the Chinese insurrectionists, they are undoubtedly intended as a kind of defence of Chinese independence against foreigners—not a wanton going outside to attack Europe.

In his speech accepting his nomination, President McKinley assured us that the organized forces which had been misled into rebellion in the Philippines were dispersed. Gen. MacArthur, however, maintains that 2,300 soldiers are all that he can spare for the Chinese service, and a demand for more soldiers is reported from every department. Gen. Lawton's estimate of 100,000 troops as necessary to maintain our supremacy was evidently none too large. The present force is too small to garrison more than half the principal towns, and in some of the important islands only the seaports are occupied. Very disquieting accounts are received from Mindanao and the Sulu Islands. Officers best acquainted with the conditions say that war with the Moros is inevitable. The island of Mindanao is nearly as large as Luzon, and it is ruled by two regiments, scattered along the coast in detachments hundreds of miles apart. When the inhabitants suspend the rapturous contemplation of American sovereignty in which Mr. McKinley describes them as engaged, and attack our troops, we must either evacuate or send reinforcements. Where are they to be procured? Every man that can be spared from this country and the West Indies will be needed in China, and unless President McKinley is prepared to call Congress together and have the army increased, it seems probable that we shall have to relinquish our "sovereignty" over a large part of the Philippines.

It has been pointed out from the beginning by those who knew the situation in the island of Luzon, that the crucial question would be that of the religious orders. No one will pretend that this question is one which concerns the American people; but no one will deny that our Government will handle it with an eye to the Catholic vote in this country. While Roman Catholics do not vote as a class, our politicians are very well aware that it is a serious matter to incur the ill-will of their Church. Should that Church take a decided position in favor of a particular policy toward the Friars of Luzon, it is certain that our Government would hesitate to antagonize it. Hence the report that Archbishop Chappelle has declared himself on the matter is important. He is represented as holding that the Filipinos owe to the monastic orders all the education and civilization which they possess; that it would be unjust to these orders to expel them or deprive them of their estates; that it would be impossible to replace them with other priests; and that the hostility to them is only on the part of those who covet their property. How far these opinions express the views of the higher clergy of the

Roman Church we cannot tell. The history of that Church, however, affords abundant evidence that its silence concerning the Philippine situation is no sign of ignorance or indifference. When the proper time comes, we shall find that the Church will have a perfectly well-defined policy to suggest to our Government; and we shall find that our Government will treat suggestions from that quarter with deference. The Filipinos may be assured that their own preferences in this matter will be treated as quite as subordinate to our higher ends as have been their ill-advised claims to independence and self-government.

Carl Schurz has always shown a remarkable talent for clear analysis and forcible exposition, and he is at his best in the letter on the Philippine situation which was printed in the *Herald* of Saturday. Mr. Schurz's paper is in form an answer to a recent defence of our policy in the Philippines by Senator Foraker of Ohio, but it serves also as the most searching indictment of that policy which has yet been framed. Its peculiar value consists in the fact that it brings together a large number of official statements which show the virtual alliance that existed between our forces and those of Aguinaldo for months after the destruction of the Spanish fleet, and thus demonstrates the breach of moral obligations on our part that is the worst feature of the whole unhappy business. Mr. Schurz is equally unanswerable when he urges that the Philippine Islands might be pacified any day by the application of the same principles there that we are applying in Cuba. The moral side of the question has never before been so cogently put.

Some facts regarding the adoption of the silver plank in the Kansas City platform have leaked out since the Convention adjourned. It has been made known by returning delegates that the policy actually adopted was the subject of much anxious consideration, and that the process of reasoning which led to its adoption was, in substance, that nearly all the persons who would oppose Mr. Bryan on account of his position in regard to silver, would oppose him even if there were no reference to the subject in the platform; that all who would oppose him on account of a new and explicit silver plank in the platform, would do so even if there were only a reaffirmation of the Chicago platform in general terms; while a large number of Populists and Silver Republicans, perhaps a million in the whole country, would abandon Mr. Bryan if there were any, even the smallest, sign of dodging the issue. Upon a deliberate calculation of the chances, therefore, it was deemed the safest course to ake a bold and explicit declaration in or of 16 to 1. It was Mr. Bryan's conviction, derived from many meetings he has addressed during the past four years, that the bulk of his supporters are still in earnest to bring about the free coinage of silver "at the present legal ratio," and that in the Democratic party they greatly outnumber those who voted for Palmer and Buckner four years ago, or who voted for McKinley direct. It was believed also at Kansas City that the Republican opponents of Imperialism, such men as ex-Gov. Boutwell, Carl Schurz, and ex-Senator Henderson, would consider that question the one of overwhelming importance in the campaign, and would vote for Bryan regardless of any other issue. To meet their views the clause was added at the last moment: "We regard it [Imperialism] as the paramount issue of the campaign."

The absorption of Democracy into Populism is rapidly becoming complete. Democratic conventions were held in South Dakota and Nebraska last week. In the former State the only Democrats whose names will appear on the ticket are the candidates for two Presidential electors and a few minor offices. The two nominees for Representatives in Congress, Governor, Lieutenant-Governor, Attorney-General, and some other less important places are Populists. In Nebraska there is only one Democrat on the State ticket of nine names, a second being a Silver Republican, and all the rest Populists. Fusion thus leaves scarcely more than a trace of Democracy, and Populism becomes supreme wherever the personal influence of Bryan is especially potent. Such developments help to illuminate the situation by making plain the influences which dominate the Opposition.

The public was so much engrossed with the Kansas City Convention that due notice was not given to a forward step by the Administration in the matter of civil-service reform—the first in either direction since the terribly long backward one of a year ago. President McKinley has approved an order putting the customs service in both Porto Rico and Hawaii under the civil-service rules, so that hereafter appointments to that branch of the service will be made, as in our custom-houses, from eligible lists of those who have passed a competitive examination. This has been followed by the sending from Washington to Manila of the chairman of the Central Board of Examiners of the Civil-Service Commission, to put the merit system into operation in the Philippines under the Taft Commission. All friends of good government will rejoice at this evidence that the President at last recognizes the necessity of taking some action to check the spoilsmen in "our new possessions," but they will not be satisfied until the right principle is universally applied, not only in Porto Rico and the Philippines, but also in Cuba—and the United States.

A proper rebuke is administered to the Administration by the *Journal of Commerce*, in an article entitled "The Bureau of Partisan Statistics." The reference is to the Treasury Bureau, which has issued a circular calling attention to the effect of the Porto Rico Tariff Act in increasing the commerce of that island. As the *Journal of Commerce* says, the Bureau has no right to publish theories and claims concerning the causes which influence trade. When it does this, it arouses the suspicion that the figures may be manipulated in order to sustain the theories. As we have recently pointed out, when the claims are of a partisan character, the suspicion becomes almost a certainty. In the present instance the claim is so obviously unfounded as to be ridiculous. A year ago our own tariff was applied in Porto Rico, and during the free-trade agitation commerce was at a stand-still. When the taxes were reduced and merchants knew what their charges would be, commerce naturally revived. It would naturally have revived more under free trade, but it would have revived simply because uncertainty was removed. The suggestion of the Bureau of Statistics that the Tariff Act had any peculiarly beneficent effect is a piece of gross impertinence.

Oregon's recent election illustrated the same tendency which had been revealed previously in other far Western States—that when the question of woman suffrage is submitted twice to the same electorate, it fares decidedly better the second time than the first. There are now seven such States, ranging between Kansas and Nebraska on the Missouri and Washington and Oregon on the Pacific, and there has been no exception to the rule. In one case the change was great enough to carry the proposition on the second trial, Colorado having rejected equal suffrage in 1877 by a vote of two to one, and accepted it in 1894 by a majority of several thousand. In Oregon an amendment was submitted in 1884, and "snowed under" by 28,176 no to 11,223 yea votes; while last month the negative total in a larger poll was almost exactly the same as sixteen years ago, 28,402, and the affirmative had more than doubled, reaching 26,265. The majority was in favor of the change outside of the city of Portland, in accordance with an invariable rule that such an amendment is strongest in the rural districts.

A controversy is now taking place between the authorities of Louisiana and those of Alabama which shows the far-reaching evil arising from the toleration of lynch-law. One Jacobi, charged with a crime in Montgomery, fled to New Orleans, and the Alabama authorities have been unable to secure his extradition. The Governor of Louisiana takes the position that it would be inhuman to surrender Jacobi, because he would probably be lynched as soon as he reached Montgomery, and might not be safe from the attack of a Montgomery mob, even at Mobile. It is reported that he has telegraphed to Gov. Johnston of Alabama, asking if the fugitive could be protected against lynching if he were surrendered; to which inquiry Gov. Johnston replied that 'it would be a shame to Alabama to have the Governor of a sister State declare that she could not preserve peace and enforce the law in her capital city." This answer evades the real issue. It is a shame that any one can declare truly that the law is not enforced in all parts of Alabama as well as in her capital city; but the shame exists. If toleration of lynch-law in a State justifies the governors of other States in refusing to surrender fugitives from justice, the Governor of Louisiana is warranted in his course in this instance. Unfortunately, the Governor of Alabama would be justified in similar action were he to receive a requisition from the Governor of Louisiana; for the law is disregarded in the latter State as well as in the former. We have lately seen the Governor of Indiana refusing the demand of the Governor of Kentucky for the extradition of a fugitive, and it admits of little doubt that the Governor of New York would take the same position. In fact, he has intimated plainly that such would be his course were ex-Gov. Taylor's extradition demanded by the Kentucky authorities.

The trial of the persons charged with murdering Gov. Goebel of Kentucky is, as might be expected, characterized by some peculiar features. In the exercise of the faculty of common sense, if not of any recognized judicial function, Judge Cantrill compelled every person entering the court to submit to a search for concealed weapons. Some of the high-spirited attorneys of Kentucky resented this as a personal indignity, but the Judge insisted on the execution of his order. The law of Kentucky forbids the carrying of concealed weapons, but we apprehend that the court is justified in taking judicial cognizance of the fact that the law is universally violated. It is quite probable that Judge Cantrill's action will avert bloodshed, for the trial will be conducted with extreme vigor by both sides. Great numbers of witnesses have been summoned, and a fierce struggle is going on over the selection of a jury. It is a reasonably safe prediction that if any stout Republican gets into the jury-box, there will be no conviction; and the probabilities are all against a conviction under any circumstances. In modern times it seldom happens that when the enterprise of newspaper detectives is baffled, that of the officers of the law is successful. Since the newspapers have failed to make out a probable case against any one, we cannot expect anything very definite from the prosecuting attorneys. Most of the witnesses they bring will be suspected of perjury; and they will be contradicted by witnesses equally worthy and unworthy of credence.

The copyright controversy between Canada and Great Britain appears to be nearing a fortunate conclusion. The pending bill has the support apparently of all factions in Canada, while satisfying as well the aggrieved parties, the English authors and publishers. The bill in fact contains several novel and interesting features, and is in every way an improvement over the old Canadian act, or over our present law. The former act provided that a copyrighted English book must be remanufactured in Canada within a month, or else, on condition of promising a royalty of 10 per cent. to the author, any publisher might apply for a license to reprint. There was, however, no provision for actually securing this royalty to the author. Thus every presumption was against him. Failing to complete in a month a difficult business transaction, his rights went over to distant publishers, who might or might not pay him the royalty fixed by law. The proposed act protects the author absolutely, while offering an ingenious concession to the Canadian printer. A book copyrighted in England is by that act copyrighted in Canada also. The author thus retains control of his property, unless he choose to transfer it to a colonial publisher. The author may, however, give an exclusive license to print and publish for Canada. In this case, the importation of non-Canadian editions is forbidden. The publisher is obliged to do the presswork in Canada, but is free to buy the plates elsewhere. In the light of this proposed act, how absurd and oppressive our law appears. We abandon all rights to the piratical publishers unless the author, by a difficult and costly negotiation, reserves them to himself. The new Canadian law will secure the property right of the author until he chooses to dispose of it. In view of this essentially just position towards property rights in literature, the English author may accept with complacency the printing clause, somewhat oppressive though it be.

Although the British Government is not in a position to reciprocate the action of the Dominion of Canada in the matter of a preferential tariff, it has found a means of recompense in another measure. A bill has been introduced in the House of Lords authorizing the investment of trust funds in the inscribed stock of the British Colonies, the effect of which will naturally be to enable these colonies to borrow on easier terms than heretofore. The interests of beneficiaries are protected by a clause forbidding trustees to purchase any of these stocks at a price exceeding its redemption value, if it is liable to be redeemed within fifteen years at par or any other fixed rate. Nor may a trustee purchase any such redeemable stock at a price exceeding 15 per cent. above par, or the fixed rate of redemption. The bill does not extend to the stock of the Indian empire, but is otherwise comprehensive in its application. A great many of these stocks are redeemable within fifteen years, and are, therefore, excluded; but the colonies will no doubt proceed forthwith to refund these stocks at lower rates. There is a good deal to be said in favor of such a measure as this; but it must be admitted that the obligations of some of the British colonies are not such as to tempt a prudent trustee to invest in them.

First a war, then investigation of the scandals which attend it. That seems to be the established order now, and Great Britain is following it. The revelations of miserable shortcomings, or worse, in the hospital service in South Africa came as a painful surprise to the English public. It had had the testimony of eminent English surgeons, Sir William Macormac among them, to the unusual efficiency of the hospitals in Cape Town and Durban; and to be told, as it has been on indisputable authority, that the hospital service at Bloemfontein and at other points in the interior had been scandalously bad, was as disagreeable as unexpected. Supplies, it is now proved, were short, medicines and tents and nurses and physicians were lacking, many wounded men were grievously neglected, and epidemics of typhoid desolated the camps. The only defence is military necessity. Lord Roberts had but a single-track railway on which to bring up supplies from a base 700 miles away. He had to accumulate subsistence for his army for an advance of twenty-five days, or else sit down paralyzed in Bloemfontein. He chose the sad alternative of letting the sick and wounded suffer rather than ruin his campaign. This is a fair statement of the dilemma with which he was confronted. Whether foresight on the part of the War Office might not have prevented him from being reduced to so cruel a choice is another matter, upon which an investigating committee is to pronounce. In any case, the reproach to the medical service of the British army is nothing like so severe as our own was exposed to for having allowed our home camps, with every supply and facility at hand, to become fever-ridden.

MR. M'KINLEY'S SHREWDNESS AND BLUNDER.

The President's speech to the notification committee at Canton on Thursday began well, was going strong (as the racers say) in the middle, but ended in the collapse of a political blunder of the first magnitude. It came out adroitly and effectively against those parts of the Democratic platform which are weak; but, unluckily, it made the mistake of dashing also against those parts which are strong. On the silver issue and the question of national good faith, Mr. McKinley rose like a man eager to smite under the fifth rib the Philistine whom the Lord had delivered into his hand. But on the topic of Imperialism, he put himself in a position where it is the Philistine who will do the smiting at *his* expense.

A shrewd politician like Mr. McKinley could not fail to strike at the joint in Mr. Bryan's harness. How completely the Democrats at Kansas City played the President's game is shown by his instant acceptance of their silver challenge. The old issue over again, he promptly retorts. It is for the people once more to unite against the "advocates of repudiation," and, in the battle for "public honor and honest money," relax no effort till a Congress is assured which will "sustain and, if need be, strengthen the present law." All this is admirably and forcibly said, and no Gold Democrat, no man who appreciates the critical importance of a sound currency and business stability, will do aught but applaud these utterances of the President. The caviller might point out that Mr. McKinley himself was long a promoter of what he now calls "repudiation," but even the caviller must admit that this particular old silverite is now soundly converted. If there was hope for William McKinley, there is hope for the man most dead in trespasses and silver; and in the complete change now wrought in the President, we see a symbol of the great transformation of the country at large.

When Mr. McKinley came to speak of other financial matters, he lacked something of perfect ingenuousness. He boasted of our being able to refund at 2 per cent., "a lower rate than that of any other country." Entire frankness would have required him to state, what everybody knows, that this rate was only temporarily obtained by taking advantage of the necessities of the banks in the matter of securing bonds as the basis of circulation. Let Secretary Gage go into the open market to borrow money, and it is safe to say he would have to pay more than 2 per cent. Indeed, the refunding law itself authorizes him to pay 3. Nor does the President's laudation of the ill-starred Dingley law, with his complete silence about the necessity of reducing war taxes, contain any promise of fiscal *taxation reform. In so far he justifies* the cynical intention of a prominent Democrat to vote for Mr. McKinley in order to make him "reap his own harvest." The example of Mr. Cleveland, crushed under the fatal legacy of Republican legislation, is the only one of the kind this Democrat wishes to see. Let the Republicans shoulder their own blunders this time, and see what good their nostrum of protection and overtaxation will do them.

It is, however, in the part of the President's speech which deals with the Philippines that we see his political cunning deserting him. He can scarcely be said to give a truthful account of the situation, and, what will doubtless seem to him and his managers a more serious matter, he states the case and outlines his intentions in a way to repel the very voters on whom the success of his candidacy depends. What can be said of Mr. McKinley's statement that "the people of the islands . . . recognize American sovereignty as the symbol and pledge of peace, justice, law, religious freedom, education, and the security of life and property"? It is the thing which is not, however much he would like it to be, true. If his idyllic picture of the islands is correct, why can he spare but a handful of troops from the Philippines for service in China? And if it is simply a question of police work, of repressing brigandage, where are the native militia who ought by this time to have been enrolled by the thousand for the work? The simple fact is that Mr. McKinley's 60,000 troops eat up his peaceful words. If they are needed, then the glad acceptance of our rule is a figment.

But what of the future? What of the charge made by the Democrats that Mr. McKinley's policy is one of Imperialism? We regret to say that he confirms the worst that has been alleged. The significant thing is that both he and Senator Lodge go further than the Republican platform. They stiffen and harden its Philippine planks till there can be no mistake about their Imperialistic intent. The platform was constructed, as its framers have said, for the express purpose of conciliating Republican Anti-Imperialists and the sensitive Germans, who know by sad experience what militarism is. So far as the platform goes, it would be still possible to talk, as Senator Spooner did, of giving the Filipinos ultimate independence. But Mr. McKinley has rudely shut the door on all those hopes. He denounces the policy of "scuttle." (This, from the valiant Porto Rican scuttler, is not without its humor.) The islands are "ours," our authority must be made "supreme"; there will be "no abatement of our rights, no abandonment of our duty." (Query, "plain duty"?)

Now we flatly say that all this, putting aside every higher question, is politically a blunder. It will drive away Republican Anti-Imperialist votes. What can Senator Hoar say to this defiant assertion of McKinley's autocratic rule in the Philippines? At the close of his speech in the Senate he called an imaginary roll, and came to this name:

> "William McKinley; William McKinley: 'There has been a cloud before my vision for a moment, but I see clearly now; I go back to what I said two years ago: "Forcible annexation is criminal aggression; Governments derive their just powers from the consent of the governed—not of some of them, but of all of them." I will stand with the Fathers of the republic. I will stand with the founders of the Republican party. No.' "

But William McKinley at Canton voted "yes" more vehemently than ever, and bade the fathers and founders go hang. We have no doubt that Senator Hoar will rise nobly to this new trial of his faith. He will trust in the President though he slay him. But to the doubters all over the country; to the troubled consciences in all parties; to the hesitant German-Americans whose votes alone may turn the whole election, Mr. McKinley's words will bear dismay. His first speech is, in this respect, his first blunder. And it is a great and grievous one.

THE TREND OF LEGISLATION.

One of the functions of the Library of the State of New York is the collection and classification every year of the statutes passed by all the legislatures in the Union. From a comparison of these statutes some notion of the general tendency of legislation may be obtained, and such a comparison is attempted in a Bulletin recently issued by the State Library. The subject is too broad to be dealt with except in a superficial manner, but in certain lines it is practicable to note changes which indicate the operation of permanent causes. If we define Socialism as the tendency to enlarge the functions of Government, we must admit that the general drift is in that direction. New commissions and bureaus are continually created, and more and more occupations are subjected to Governmental inspection. In some cases we may be able to discern the influence of a rational and enlightened public opinion, but in others we see the effect of political agitation and of class interests.

As illustrating progress of a satisfactory kind, we may take the legislation affecting the liquor traffic. During the last fifty years this traffic has been prohibited by the laws of no less than seventeen States. At present it is proscribed in only five States: Maine, New Hampshire, Vermont, Kansas, and North Dakota. These are States in which the population is comparatively sparse, and the farming class is predominant. When we consider the intensity of the feeling concerning the evils of drinking, the zeal of the Prohibition party, and the very great moral influence of the Woman's Christian Temperance Union, we must admit that the repeal of so many prohibitory laws is a remarkable achievement. On the other hand, the rather tempting experiment of the State dispensary system has not commended itself to the sober judgment of our people.

As this Bulletin points out, the attempt to instruct school-children in the physiological effects of alcohol is really a sign of progress. Instruction of this kind is now prescribed in all the States except Georgia, Idaho, Virginia, and Wyoming. We have never thought that teaching of this kind was a desirable feature in the public-school course. Much of it is extremely crude and even false; nevertheless, the method employed is better than that of prohibitory laws. It implies a recognition of the truth that persuasion is superior to force, and it tends to promote temperance by making the effects of alcoholic drink a subject of rational discussion and scientific observation. We may look forward to more correct teaching than now prevails, and to the gradual diffusion of the truth that temperance is but one feature of a sound morality, and that if our children are brought up to desire right living, it will not be necessary to frighten them into abstinence by the exhibition of appalling pictures of the coats of the drunkard's stomach.

We may find further instances of the gradual recognition of changed morality by legislatures in the modifications of the Sunday laws. It was not until 1893 that the State of New Jersey removed its legal prohibition of the publishing and selling of newspapers, the selling of milk, and of walking or riding for recreation, on Sundays. Not until 1897 did Connecticut remove its ban from recreation on that day, and only last year did it legalize the operation of electric cars. The State of California repealed its Sunday laws in 1883, but in 1893 an act was passed restraining employers from exacting more than six days' work in a week from their men. But our legislation on these subjects is extremely defective. Most of the old Sunday laws ought to be swept away. They are not enforced, and are cumbersome relics of an outgrown morality. On the other hand, our laws fail to recognize the fact that the community has adopted the view that six days' work a week is enough. We want one day a week for recreation; but we make little provision for the regulation of the labor of those who have to work in order that others may enjoy themselves.

It is only thirty years since the first State Board of Health was organized in Massachusetts. Now such boards exist in all but five of the States, and their operations will probably be supplemented before long by a national board. The creation of these boards has resulted in much improvement in our vital statistics, although in many States their registration is very imperfect. An illustration of the same tendency appears in the legislation which purports to prevent the adulteration of food; but here the evidence of pecuniary and class interests is so strong as to make it doubtful if such laws indicate genuine progress. The same doubt is suggested when we review the legislation professedly in the interest of laborers. The first Bureau of Labor Statistics was established in Massachusetts in 1869, and such bureaus now exist in thirty-two States, while the Federal Government also maintains one. In view of the large cost of these bureaus, and the partisanship to which most of them have fallen victims, the results which they have achieved are not such as to justify their existence. They have not aided social progress perceptibly, while they have complicated our politics. At the demand of the labor unions, many laws have been passed which have been ineffective, not only because they were regarded as creating offices to be filled by representatives of these unions, but also because they constituted class legislation. Very many of them have been declared unconstitutional; and they illustrate the class of changes which hinder genuine progress. The eight-hour laws, which affect only laborers employed directly or indirectly by Government, cannot be regarded as in the interest of the whole class of laborers or of the community. They benefit a privileged few, at the expense of the unprotected many. The old guild spirit creeps back, too, in laws intended to restrict the numbers of such artisans as blacksmiths and barbers. The general welfare is invoked here, as it always is, to justify special advantages, and over such attempts great struggles will take place in the future.

Many bad laws are passed, and many changes made which are not for the better, yet as we survey the whole field of legislation from year to year, we discern so many advances as to justify us in believing that we are all the time making genuine progress.

LIGHT ON THE BOSS BUSINESS.

Gen. Greene, the new President of the Republican County Committee, is confirming the worst fears of the machine. He actually wants the political workers under him to be honest—financially honest! He has found a shortage in the Committee's accounts of $20,000, or so, and doesn't like it. The bookkeeping system he discovers to be ingeniously devised to invite fraud and peculation, and, in his offensive reformatory zeal, he is giving orders to have the accounts kept in the ordinary way of business men. Worse than this, he has determined to have one regular bank account, with no money to be drawn out except by check signed by the President and Treasurer of the Committee. Naturally, he is stoutly opposed to Quigg's little plan of a Finance Committee, *à la* Tammany, with himself the irresponsible head of it, *à la* Croker. No wonder that Quigg, with such an enemy as Gen. Greene is proving himself to the tried and trusted methods of Republican politics, placed at the head of the most important committee, should be indulging in and divulging horrid fears lest Bryan carry New York.

These incidents should illumine many darkened minds respecting the boss business. Taken in connection with Platt's open arrangements to turn over the Republican boss-ship, with all its hereditaments and appurtenances, to Mr. Odell, they enable us to see precisely what the meat is upon which our Cæsars feed to grow so great. Exactly what is the property which Platt, being weak in body, but of sound and disposing mind, is preparing to will to Mr. Odell? Is it political wisdom? Is it long acquaintance with the wiles and guile of the Democratic party, and skill in meeting them? No, it is the power of the purse, simply and brutally; it is the power to receive political contributions and collect campaign tribute, with no questions asked, and no accounts kept or rendered. The Thrale brewery boasted no such potentiality of wealth.

One can but be amused at the simple-minded surprise of Republicans in this city at the cool way in which Platt is dictating the succession in tyranny. They have long been counting upon Nature and the revolving years finally to rid them of Platt's hated despotism. His yoke they could not throw off as long as he lived, but when he was gone! Then the old, free Republican party would be restored. Platt could leave no possible successor. The party simply would not stand it, you know. Well, the boss, like Conan Doyle's Duke at the battle of Armageddon, "will have a word to say about that." Having the greatest untaxed franchise in the State at his disposal, he does not propose to let it expire with him, but means to pass it on in unimpaired vigor to Mr. Odell.

There have been two theories about the secret of Platt's bestriding his party in this State. One is what may be called the diabolic theory. He was a man in alliance with the powers of evil. He had spun political plots out of his vitals as a spider spins her web. Of infernal ingenuity, and a very master of malevolent intrigue, he had got one and another party leader in his clutches, by a kind of black art, until he could not be shaken off. Of course, no such Quasimodo of political mischief could succeed him; and, his evil reign once over, the party could hold up its head again. The other theory made out Platt more human, a man of like passions with other mortals, even kindly in his way, but of singular sagacity, of old experience attaining a prophetic strain, managing men by wisdom, controlling his party by astuteness, conquering by shrewd counsels. This theory, too, implied, of course, that no such king of men, no such miracle of political insight, would be raised up to succeed Platt. Nature would break the mould. We have heard of a leading Republican politician of this city gravely shaking his head, when the question of Platt's successor was raised in conversation, and saying, "Mr. Platt will have no successor. No other man has his sheer ability, his extraordinary talent for leadership, his ripe experience, his profound knowledge of human nature"—our readers can guess the rest of the panegyric.

Everybody can see now, however, that the hiding of Platt's power is quite elsewhere. He has been a boss not because he was a fiend or because he was a sage. Ever since he first sat at the receipt of customs, as Chairman of the State Committee, and used the position to make himself Senator, the secret of his career has been an open one, to those who had eyes to see. The most blind ought now to be able to see it. Platt's designation of Mr. Odell as his heir is as revealing a proceeding as the filing of a will in the Surrogate's Court. It discovers the decedent's property and what he does with it. Platt's public property has consisted simply in being the "man whom you pay." That is the only tangible asset he can make over to Mr. Odell, but, that once passed on, all is passed on. If Republican business men go on paying money to a man who never renders accounts, if corporations continue to buy legislation from him, or pay him blackmail, the dynasty will be perpetuated. We shall simply say, "The boss is dead; long live the boss!" But if honest Republicans snap their purses shut when the boss's collectors come round, or say they will give only when some such system of business-like accounts is adopted as Gen. Greene advocates; if conscience or fear of publicity restrains corporations from swelling the secret corruption fund of the man in whose hands money means nomination to office, and control of his creatures in office, then we may begin to hope that the line of bosses will become extinct. The remedy is, as it has always been, in the hands of those who pay. The "man whom you pay" is but their wretched creature. The business of the boss is nothing, in essence, but the control of the party treasury; and if his supplies were to be cut off, he would die like an ordinary Christian.

THE GERMANS IN CHINA.

Among the items of news from China last week was a report from Canton that there had been a fight between the Germans and Boxers at Kiao-Chau in which many of the latter were killed. This incident, and the killing of Baron von Ketteler by the mob in Pekin, seem indicate that the irritation caused by the seizure of the bay and town of Kiao-Chau by Germany some three years ago is still active, and must be held accountable in large part for the present desperate situation in northern China.

The facts connected with this seizure are presented in an impartial way in the current number of the *Forum* by Charles Denby, jr., our former Secretary of Legation at Pekin. That the acquisition of a strip of territory on the Chinese coast had been in contemplation for some time before the actual seizure took place, was made plain by a speech of Herr von Bülow in the Reichstag, April 27, 1898, explaining, in part, the reasons for the seizure of Kiao-Chau. He said that Germany did not desire a partition of China, but was determined that, if it came, she should have a strategical position which would enable her to exercise a decisive influence in the future of the Far East. This, he said, was on the principle that the devil takes the hindmost. Germany now had a naval station and ports and the nucleus of an army in a convenient position. She could accordingly look with complacency on the development of affairs.

How this point of vantage was obtained has not been forgotten by distant observers; and therefore must be held in lively remembrance by the people whose territory was seized. Two German missionaries were brutally murdered by a Chinese mob at a village in southern Shantung, November 1, 1897. Germany demanded full reparation, indemnity for the families of the victims, compensation for the expenses incurred by the Government, and a naval station on the coast of China. If the Italian Government had demanded from us compensation for the victims of the New Orleans massacre, plus a naval station in Mobile Bay, the two cases would have been parallel in the eye of international law; the only difference being found in the strength of the Powers concerned, and their ability to enforce or resist the demand. China complied with all the requirements of Germany except the last, and had not refused even that when the German forces in Chinese waters, only two weeks after the murder of the missionaries, seized Kiao-Chau Bay, landed soldiers, and took possession of the forts and adjacent territory. Such haste implied an apprehension that the Chinese Government might offer a less advantageous place, or refuse the demand altogether. Some months after the seizure had been effected, the Chinese Government recognized it as an accomplished fact, and made a treaty with Germany granting a lease of the bay and adjacent territory for ninety-nine years, but retaining the sovereignty over it. That this reserved sovereignty was only nominal is shown by the fact that the government of the leased territory was vested in Germany. Various grants for the building of railways and the working of mines beyond the leased territory were embraced in the treaty, and these were coupled with written assurances that Germany had no treacherous intention to seize any land beyond the boundaries of the lease, but only to increase commerce and improve the relations of the two countries.

Mr. Denby mentions the following reasons why Germany seized Kiao-Chau rather than any other *point d'appui* on the coast:

> "Except Shantung, there was scarcely a province in which she could have planted herself without encroaching on the alleged rights of others. It is a sad commentary on the decadence of China that there is scarcely any desirable territory along the coast which does not fall within some foreign government's 'sphere of influence.' To have gone north of Shantung would have been to enter a field where the White Czar is self-predestined master. South of Shantung, in the provinces of Kiangsu and Chekiang, we come upon the Yangtse Valley, which has been staked out by England in a shadowy agreement with China that no part thereof shall be alienated to any other Power. The coast of Fukien, further south, has been preëmpted by Japan, by virtue of her annexation of Formosa—a preëmption which has been recognized by the Chinese Government in an agreement, made in April, 1898, that no part of this province shall be alienated by any nation but Japan. In the next two provinces, Kuangtung and Kuangsi, any German establishment would have been regarded with more than disfavor by England and France."

Mr. Denby adds that all the deep-water harbors on the coast are now in the hands of foreigners except that of Amoy. Italy, it is well understood, would not refuse that.

It is not to be supposed that the seizure of Kiao-Chau Bay was looked upon with indifference by the Chinese people or that it was without its influence in arousing the revengeful spirit of which there has been so much evidence during the past month. Although there was no popular outbreak at the time; although there was nothing like a general protest against the cession of Kiao-Chau to Germany, or of Port Arthur to Russia, yet there is much reason to believe that the dreadful scenes of the past month are traceable to an aroused public spirit, and not to the labors of missionaries in China. It can hardly be due to accident that the German Minister was the first to fall a victim to Chinese vengeance. The Government of China, in its explanation of the killing of Baron von Ketteler, does not refer to the seizure of Kiao-Chau Bay. It could not do so, since it had given its consent and ratification to it subsequently; but unless the Chinese are different from all other races of men known to history, the acts of Germany and the other grabbing Powers would be sufficient to account for all the bloodshed that has taken place in China since the 1st of June.

THE PARIS EXPOSITION.—IV.

FRENCH AERIAL NAVIGATION.

PARIS, June 23, 1900.

In the huge U-shaped building where most of the articles made in this world can be seen—from mighty machines of shining steel and brass to the most delicate fabrics fashioned by their almost human intelligence—one occasionally comes upon surprising oases, suggestive collections which open unexpected avenues of thought rather alien to the superbly material forcefulness of surrounding exhibits. Such are the remarkable cases of old keys, ancient locks, and ornamental iron work with which several happy hours unconsciously slipped away. One could scarcely imagine that so many beautiful forms of historic keys could exist, until these noteworthy collections of M. le Secq des Tournelles had been studied. Another is a fascinating room full of antique clocks and watches, hourglasses and clepsydras—the history of time, as it were, and still serviceable in annihilating our common father, though perhaps in a different way from that which their long-vanished makers intended. Of scarcely less interest is the corner in which are brought together all ancient devices in connection with artificial light—candlesticks of exquisite old shapes and many materials, snuffers and trays, numberless shelves of extinguishers, Roman lamps and candelabra, an epitome of historic illumination.

But I discovered to-day a veritable wellspring of pleasantness, after a somewhat arid stroll past wheels and leather, carriages and carpets. My attention was attracted by a large, bat-like object suspended overhead, showing a multiplicity of mysterious and rather chaotic wings: a bird, a butterfly, an August cicala, a bat, and a whirling maple seed combined, might perhaps describe the Ader type of flying-machine "éclaireur et torpilleur." It seemed to suggest the objects below. Captive balloons of many models, with various kinds of cars and baskets, opportunities for choice in ropes and pulleys, and even the pongee silks made in China and Japan for gaseous inflation, attracted few gazers; but the case containing a picture of Andree and his associates, Fraenkel and Strindberg, was constantly surrounded, as the one farther on, representing the frozen fjord and glistening mountains above which their balloon was poised on the 11th of July, 1897. Aeronautical instruments for meteorologic observation are grouped together, and a neighboring map shows the tracks of various high-air voyages from Paris to a distance of 1,200 kilometres. All these, with flying machines of different principles and epochs, "grapplers" and anchors for landing (unexpectedly or otherwise) upon earth and sea, make a very modern section, of which the interest is not diminished by a glance at the fine photographs taken from different altitudes. These appear to be a series of particularly good enlargements. St.-Genis-Laval (Rhone) from a height of 650 metres is clear and perfect, while a charming picture of cumulus cloud in process of formation, allowing between its masses distant but distinct glimpses of fields and woods, was taken from a height of 1,350 metres. The Pont-des-Vaux (Ain) from 1,600 metres is small yet still clearly defined, and lovely cloud photographs are shown, made at 2,050 metres altitude.

It will be remembered that scientific ascents for the purpose of getting above the accidents of meteorological circumstance have not been unknown; and here may be seen the actual substance of *Le Volta*, in which the famous astronomer Janssen made his upper-air pilgrimage on the 2d of December, 1870. This devoted observer, thus leaving besieged Paris in ample time for the sun's eclipse of the 22d, was not rewarded for his energetic faithfulness; an overcast sky being his portion upon the important day. The siege of Paris, indeed, is constantly memorialized in these aerial cases, in ways other than scientific. One of them contains a fragment of the material used by Eugène Godard in constructing *Le Washington* for use during that memorable winter; some of the dispatches thus sent overhead; and pictures of the balloon high above the city, casting its shadow upon surrounding clouds. Here, too, one sees the carefully stuffed body of the carrier pigeon celebrated at that troublous time—another sort of aerial communication, to be sure, but perhaps appropriately commemorated here. The tragic death in the sea of Prince on the 30th of November, 1870, and of Lacaze, who ascended in the *Richard Wallace* the 27th of January, 1871, and also perished in the ocean, are represented several times in harrowing pictures. Other cases contain volumes upon high-air navigation, volumes of *L'Aéronaute*, and numbers of the *Journal des Voyages*, illustrating this phase of human endeavor. Also exhibited are the kite explorations of upper air brought to such successful issue by Mr. A. Lawrence Rotch of Blue Hill. The familiar face of Dr. Abel Hureau de Villeneuve and those of MM. Henry Gifford and Maurice Mallet look from one frame, beside many old engravings of ascensions, successful descents, and fatal endings.

But historical collections of balloon memorabilia may be both poetic and æsthetic. This is proved by the quaint and beautiful articles owned by M. Louis Bérean and M. Albert Tissandier shown near by. Curious old prints published more than a hundred years ago, some of them colored, represent every sort of attempt at aerial navigation, sometimes seriously, often in amusing caricature, with catastrophes, both humorous and ghastly, which would appear to have been particularly dear to the hearts of artists and engravers in 1783 and thereabouts. Stone and marble tablets, one of that year in memory of De Rozier, oddly decorated medals in silver and bronze, an ancient oil painting of a captive balloon reluctantly restrained by ropes held in the tugging hands of a dozen blue-coated gentlemen of a past century, fill the first case, with a superb lot of old books. Among them is 'Essai sur la Nautique Aérienne,' published by Eugène Onfroy in 1784, and a fine old volume issued in Brescia in 1670, dedicated "Alla sacra Maestà Cesarea del Imperatore Leopoldo I," and volume iii. of 'La Découverte Australe, par un Homme-Volant; ou Le Dédale Français; Nouvelle très-philosophique,' of which the first volume is in another collection farther on. Volume i., however, has a more amusing frontispiece, wherein an airily attired individual in wings and an umbrella, carrying a suspended basket below his feet, is about to set sail into space from the summit cliff of a high mountain.

The painstaking and beautiful accumulation of M. Tissandier shows silver and pewter plates engraved with balloon subjects, numberless handsome snuff-boxes of multitudinous designs of the same idea painted or inlaid, old prints in quaint frames; cups and saucers, sugar-bowls, water-pitchers of all epochs; a vase in shape like a Japanese saké-bottle, a tiny drum of ancient form, silver candlesticks, miniatures, and jewelry set in brilliants, a cane, a sword, silver-handled knives, nearly thirty plates, and more than two dozen exquisitely painted fans, long gloves, brass escutcheons and ivory carvings—all old, all exhibiting in one form or another the thought of balloon voyaging or navigating the air in some manner. It forms a noteworthy and most curious aggregation, even a lot of antique printed cottons adding their pictorial testimony to aerial history.

For the sun's eclipse of August, 1887, Professor Mendeléef also attempted to rise above the clouds, in Russia. His experience could hardly fail to come to mind among these high-air memorials, though no record of his trip is shown here. In some way his aeronaut was left behind at the last moment, so that the astronomer got above the clouds in well-nigh a double sense, shooting up alone into space to a height of nearly two miles above the earth. He did obtain, from this lofty region, a clear and unobstructed view of a fine corona, quite obscured to his countrymen below; but we can well imagine that the imminent duties devolving upon him as the guiding spirit of so novel a conveyance must have allowed but preoccupied attention to solar glories.

M. Henry Dumoutet is an artist especially skilful in painting scenery of the upper air, and many illustrations from his facile brush are shown, in small monochrome water-colors, as well as oil representations in natural colors of life above the clouds. Moonlight with the strange atmospheric effect of a cross like an elongated corona around the mild luminary, zodiacal light in the constellation Virgo, earth-scenery from above, and many technical matters he has artistically delineated, especially the effects observed during the ascent of *L'Alliance* on the night of the 14th of November, 1899, with the Russian astronomer, Hansky, from Meudon, to look for the coy Leonids. A few of these, too, are shown, and his pictorial record of another excursion for a similar purpose two nights later also appears, when he once more essayed the empyrean in company with MM. Louis Vernachet and E. Valentine.

Of Mlle. Dorothea Klumpke's experiences during an aerial voyage in the *Centaure*, during the early morning of November 16, 1899, also in search of that year's elusive meteors, she has already told delightfully in the June *Century*. Her account, as she described to us orally her preparations and her flight into space, was even fuller than her written description of the mystery and exhilaration, the strange nearness of the unknown, and the inexplicable charm of upper air. She is "docteur ès sciences," and at the head of a force of computers in the Paris Observatory, charged with the very important duty of preparing a catalogue of the stars from the plates of the International Astrographic Congress. For the solar eclipse of the present year, May 28, she made another balloon ascension, but was unable to reach an altitude entirely above the mists and cloud enshrouding Paris at that time. The disappointment was less vital since the eclipse was not total here. Mlle. Klumpke has read a brilliant paper this week, at the International Congress of Women, upon feminine achievement in astronomy—a subject upon which she is undoubted authority.

Of course there is a captive balloon in the Exposition grounds, for the amusement of the laymen; but of far greater interest is the exhibition of free balloons at Vincennes. Last Sunday eight fully inflated air-voyagers of forty or fifty feet in diameter were simultaneously shown. Four ascended in twenty minutes, with their aeronauts. In one, a lady started on the unknown voyage with two aeronauts; in another, the captain of the celestial craft started alone. The lower air was perfectly quiet when the balloons were freed, and all took different directions, according to the speed of their vertical ascent and the corresponding air currents which they struck later. They set forth at four o'clock, but at sundown only one had entirely disappeared from the gaze of the vast throngs watching at Vincennes. The experiments are conducted under the auspices of the Committee on Aerostation, of which the veteran expert De Fonvielle is secretary.

The subject of human transportation through space will always be of profound interest until it is a practically and comfortably established fact of every-day occurrence. And France is surely the country in which this problem is liable to meet its final solution. MABEL LOOMIS TODD.

A NEW NATIONAL GALLERY FOR ENGLAND.

LONDON, June 27, 1900.

A new gallery has been added to the national possessions of England. On Monday, the 25th of June, Hertford House in Manchester Square was opened to the public, and now at last, after three years of waiting, the famous Wallace collection, bequeathed to the nation by Lady Wallace, is on view to all who choose to come and pass through the turn-stile at the door.

The history of the collection is well known. Its foundation was laid by the third Marquess of Hertford, the original, it is said, of Thackeray's Lord Steyne. It was added to enormously by the fourth Marquess, who, owing to some forgotten dispute with the vestry of his parish, went to live in Paris, which accounts for his special interest in the art of France. And it was completed by Sir Richard Wallace, to whom, instead of to the next of kin, it was left by this same Marquess upon his death in 1870. Sir Richard Wallace and, afterwards, Lady Wallace were generous; they were among the most frequent contributors to the Academy and other exhibitions of old masters; for a while, when the collection was first brought back from France, it was shown in the Bethnal Green Museum, where it remained from 1872 to 1875, so that the value of the treasures that Lady Wallace (who had inherited them in her turn) bequeathed to the nation was fully realized at the time of her death in 1897. Indeed, there could be no question as to accepting her bequest, though she did hamper it with certain conditions, and the National Museums have already suffered sadly from too many conditional gifts. I do not believe any one doubts the advantage of centralizing the great national collections. The pictures from Hertford House would have helped to fill the serious gaps in the National Gallery; the furniture and bronzes, faience and porcelain would have performed the same service in South Kensington; and the arms and armor would have made the armory at the Tower a worthy rival of that wonderful museum in Vienna. But Lady Wallace stipulated that the collection should always be kept together and known as the Wallace collection, and that the Government should agree to provide a special building for it in a central part of London.

As I have said, the bequest was one the nation could not afford to refuse, on any terms, and the result was that the Committee in charge decided that the collection should remain in Hertford House. Sir Edward Poynter objected. As Director of the National Gallery, he knew better than most men how much the Watteaus and Fragonards, the Lancrets and Paters, the Corots and Rousseaus were needed in Trafalgar Square, and he suggested as a compromise that a new building should be put up as near the National Gallery as possible. But he was alone, and unfortunately could not convert the rest of the Committee to his way of thinking. It is a pity, for Manchester Square is off the beaten track of museums and galleries—though Mr. Whistler's Company of the Butterfly now has delightful rooms round the corner—and there is just a danger of its sharing the fate of the picturesque little Soane Museum, virtually forgotten because it happens to be hidden away in Lincoln's Inn Fields.

However, it must be admitted that Hertford House is, in every other respect, an admirable museum. It has the charm of not having been built for the express purpose of exhibiting works of art. Two of the most beautiful museums in Europe are the Cluny in Paris and the Plantin in Antwerp, simply because they have not the look of museums. Hertford House, of course, cannot compete with them in beauty, and many of its apartments have been altered and rebuilt. Still, it retains, on the whole, the air of a palace rather than a gallery, and the arrangement of the collection adds to this effect. It has come to be a tradition nowadays that examples of the different arts should be separated as jealously as if their meeting within the same four walls were a crime. But there is no reason in the world why beautiful things should not be shown beautifully, and it is to the credit of the Directors that at Hertford House they have refused to draw the usual line of separation. The arms and armor have four spacious galleries to themselves on the ground floor; but the wonderful French furniture, of all kinds and many periods, the almost unrivalled Sèvres porcelain, the enamels and bronzes, the eighteenth-century snuff-boxes, the miniatures, the medals—all these things and many more are scattered throughout the large and small rooms whose walls are covered with pictures. The one drawback of this arrangement, at the moment, is an excess of gorgeousness. The walls in several of the galleries are of a vivid red that overpowers the paintings, the cases in the centre are aggressive with gilding. The cool, quiet green used as background for the Watteaus is a continual reproach to the hotter tint of the other rooms. But reds and gilding will be quickly subdued to the proper tone by time and London atmosphere, and the present flamboyant color and glitter reduced to an appropriate harmony.

The chief interest of the collection centres about the series of French pictures, for the simple reason that hitherto the French School has been all but unrepresented in the British national galleries. There are other fine pictures, to be sure: two or three splendid portraits by Rembrandt and one by Van Dyck; examples of Velasquez, Rubens's "Rainbow Landscape," a Titian, the "Perseus and Andromeda," lost to the world, the catalogue says, for about a century; a long succession of English portraits of the eighteenth century, among them Reynolds's "Strawberry Girl," which he himself describes as "one of the half-dozen original things which no man ever exceeded in his life-work," and his "Nelly O'Brien," which D'Annunzio has just been coupling with the "Mona Lisa"; and, without exception, the most delicate renderings of Venetian architecture and waters by Guardi that I have ever seen anywhere. But, after all, most of these masters and all the schools to which they belong may be studied just as well in the National Gallery, where, however, you might fancy French painting had come to an end with Claude and Poussin. Save for an occasional Greuze, Madame Vigée-Lebrun, and Rosa Bonheur, there is no French work at all. But in the Wallace collection there are exquisite Watteaus, nine in all; there are Lancrets, Paters, Fragonards—all the painters of *Fêtes Galantes*, of the artificial romantic comedy that faded and paled before the terrors of the Revolution and the cold classicism of David. There are Bouchers. There are men like Prudhon and Boilly, the connecting links between the eighteenth century and the Romanticism of 1830, the period that is most surprisingly well represented. It begins, as it should, with the English Bonington, an influence in France long before he won recognition in England, and it is doubtful whether there is another series as complete of his paintings and water-colors. And after him come Géricault, Delacroix, Decamps, Marilhat, Couture, Corot, Rousseau, Troyon, Dupré, Diaz. True, there is much that now has but an historical interest—innumerable canvases by Horace Vernet and Camille Roqueplan making you wonder why it ever seemed worth while to any one to collect them, even if here are the very pictures singled out for praise by Heine and Gautier: Vernet's "Judah and Tamar," Roqueplan's "Lion in Love," for example. But they have their place in the history of French art in the nineteenth century, and the great regret is that Sir Richard Wallace died just a little too soon, perhaps, to appreciate that this history is not complete without the work of Manet and Monet, Degas and Puvis de Chavannes, and one or two others whose fame and influence will prove something more than the passing fashion of a day.

But in a collection that has so many virtues the faults need not be insisted upon. After this, every American who comes to London and visits the National Gallery must complete his studies there by the journey across central London to Hertford House, in Manchester Square. N. N.

AFTER PETER THE GREAT.

PARIS, June 28, 1900.

M. Waliszewski is indefatigable. He has given us four volumes in succession: 'Le Roman d'une Impératrice,' 'Autour d'un Trône,' 'Marysienka,' and 'L'Hérédité de Pierre le Grand.' The two first volumes are a complete history of Catherine II.; the third is the history of Marie de la Grange d'Arquien, who became the wife of Sobieski. These works, if they are written in a sort of broken and exotic French, and sometimes show a sort of curious agitation of mind and fervor of imagination very uncommon in historians, constitute, nevertheless, a very important addition to the history, still so little known, of Russia, by the abundance of their documents, all taken from original sources. Twenty-five years ago, the Duke Decazes, who was then Minister of Foreign Affairs, opened to M. Waliszewski the Archives of the French Foreign Office, and thus gave him, with a taste for historical researches, the means to satisfy his curiosity. In his fourth volume he has used not only the French Archives, but those of Dresden and of Berlin.

The volume opens after the death of Peter the Great. The situation was singular; there was no will, no heir to the throne, no law of heredity, "no sovereign in a country where the sovereign had arranged that all power should emanate from him alone, and that there should be nobody to regulate him." The only law was, for the moment, in these few words which Peter had traced in his agony: "Give everything to . . ." He had not been able to finish the sentence. The old aristocratic families of Russia were divided and jealous of each other. The men in office were all upstarts, creatures of the reformer; they were afraid of falling into obscurity again. Their only chance was a perpetuation of the great reign, and therefore all their wishes and hopes went to the companion of the Tsar, with whom they had a community of interests and sentiments. Was not Catherine, like themselves, an upstart and a creature of Peter? She manœuvred with great ability. During the last illness of the Tsar, she made arrangements with the officers of the guards; as soon as Peter was dead, she convoked the Synod, the officers of state, surrounded the palace with troops, and was proclaimed Empress. Catherine I. owed her elevation to the throne to a *coup d'état*, and this method was followed afterwards for Ivan III., Elizabeth, and Catherine II. "The Guard will always play, in these revolutions, the part of the ancient chorus. Behind the authors of the revolution of 1762 there will not be even the shadow of a principle, and the Orloffs, in order to attain their object with the wife of Peter III., will take the shortest road, the road used by soldiers when they feel strongest."

With the régime of *coups d'état* came also that of government by women, of gynecocracy, which lasted seventy years. It is rather curious that this form of feminism found a natural theatre in the Slav world. In Russia, as well as in Bohemia and in Poland, woman has frequently the features and character of an Amazon. At Novgorod, women appeared in the popular assemblies. Herzen spoke severely of Catherine I. He said that "the Russia of Peter the Great reached the new Russia through a house of prostitution." In reality, not much that is certain is known about Catherine before she became the wife of the sovereign. In 1702 she was called Martha, and "between the house of Parson Glück and the camp of the conquerors of Livonia, she filled the office of a good German maid, used to most humble functions." The year after, Peter took her to Moscow, she was converted to the Orthodox Church, and had two children, Anne and Elizabeth. She was married to Peter only in 1712, after the birth of these children. It is said that she did not know at first how to read and write; but in three months she learned to sign documents of state, and the Russian Archives possess her book of expenses from 1722 to 1725, written in her own hand. The Empress was surrounded by German maids, and by German or Polish adventurers, such as Reinhold Loewenwolde, the agent of the Duchess of Courland (daughter of the eldest brother of Peter), a typical representative of those Germans who, under Peter I., held themselves "as tranquil as water, as low as grass," as the Russian proverb runs; and Sapieha, who became her lover at the same time, the type of those Polish noblemen who, "at the approach of disaster to their country, saved their own fortunes at the price which is generally given for such compromises."

What the Court was at the time can be gathered from these lines of Lefort, the Saxon envoy:

> "July 14, 1725.—It is impossible to define the conduct of this Court; night is turned into day; . . . nothing is done; . . . nobody will undertake any business; . . . the palace is inaccessible, full of intrigues.
>
> "May 25, 1726.—I am afraid of being considered a liar if I say what sort of life is led at this Court. Who would believe that the nights are all spent in horrid scenes of drinking? . . . There is no question of business; everything languishes and perishes.
>
> "March 15, 1727.—The Treasury is empty; nobody is paid. . . . In fact, I cannot find sufficiently vivid colors to paint this chaos."

It is quite true that Catherine spent her life in drinking, that she kept her old habits of washerwoman, of regimental cook; that she did not for a moment think of governing. "Nevertheless," says M. Waliszewski, "there was a government moving in the chaos of which the Saxon envoy speaks; it lived and was not drowned, otherwise this reign, as well as the following reigns which closely resembled it, would have marked the end of Russia. Gynecocracy had, in this country as elsewhere, a natural counterpart, at the same time damaging and salutary, namely, favoritism." Russia was, in reality, in the hands of more or less clever favorites. "This phenomenon does not explain wholly an enigma which puzzled all the contemporaries—the maintenance and development of a formidable power under conditions of life which, to all appearances, ought to have determined its ruin. Russia had other reasons for living and increasing its power, which I will try to explain. But the participation in power of the Menshikoffs and the Potemkins was one of the elements of this prodigious destiny."

During his lifetime Peter the Great sometimes accepted Romodanovski and sometimes Menshikoff as substitutes in the exercise of the fundamental functions of sovereignty. In the absence of any organized political bodies, Catherine had nothing to do but to allow Menshikoff to perform the duties which he had often assumed during Peter's journeys. Menshikoff became the real ruler and sovereign. He encountered some rivals—the Duke of Holstein, Tolstoi—and had to make concessions to them. The Empress died at the age of fifty, after a few months' ailing. According to the terms of her will, the new Emperor was Peter Alexeyevitch. The will safeguarded the rights of Anne and Elizabeth, in case Peter should die without posterity.

Peter II. was only twelve years old. He had nothing of his grandfather in his appearance, and looked more like his mother, Charlotte of Wolfenbüttel. He was in the habit of calling Menshikoff "papa," and so continued. Menshikoff took him into his own house, sent away his preceptors, and gave him one of his own choice, the Westphalian Ostermann. On the height which he had now attained, Menshikoff showed much cleverness. In order to give solidity to his fortune, he surrounded himself and the young Emperor with members of the oldest families, the Galitzins, the Dolgorukis. He set free the grandmother of the young Emperor, who had been kept in prison since 1718 in the convent of Lake Ladoga, Eudoxia Lapukhin, who went under the name of the "Nun Helen." Curious details are found in the papers of the time as to the treatment inflicted at Schlüsselburg on this touching victim of the passions of Peter the Great. Eudoxia was not, however, allowed to come to St. Petersburg.

The history of the fall of Menshikoff is told at great length by M. Waliszewski. The young Emperor did not long follow his rule, and on the 7th of September, 1727, dismissed the man who had been the favorite of Catherine. Menshikoff was exiled to his estate of Oranienburg, and lost all his dignities. All the members of his family left St. Petersburg. The people looked upon these changes with indifference, being ignorant of the causes and not perceiving the consequences.

Peter II. was a very despicable sovereign—or, rather, he was no sovereign at all. His whole time was spent in hunting. With all his defects, he was popular. He kept the army on a peace footing, and therefore did not tax the people very heavily. He affianced himself to one of the Dolgorukis—Catherine, who was very handsome, very bold and imperious, and who had received a good education at Warsaw. The succession of Menshikoff was divided between the Dolgorukis and the Galitzins. Ostermann, who had been one of the chief instruments in the downfall of Menshikoff, though Menshikoff had been his protector, continued to have much influence.

The Emperor put off from day to day his marriage ceremony. Ostermann was secretly plotting against the Dolgoruki family; the Emperor was tired of their rule, their pretensions, their avarice. On the 6th of January, 1730, took place the ceremony of the blessing of the waters of the Neva. Peter was at the ceremony with Catherine Dolgoruki; he took cold on his return, and fell ill of the smallpox. The consternation of the Dolgorukis was great. The diplomatic body became agitated. Peter had the imprudence to open a window the fifth day after the beginning of his illness; the eruption was checked, he was lost. A will was presented to the dying Emperor, in which Catherine Dolgoruki was called to the throne. Ostermann thwarted the plans of the Dolgorukis. The Vice-Chancellor kept guard over the bed of Peter, who was in a state of delirium. Ivan Dolgoruki went through the rooms of the palace, sword in hand, screaming, "Long live the Empress Catherine!" He found no echo, and finally went home and burned the false will. When Peter II. died, nothing was ready. Fortunately, there was a Supreme Council, which was able to take the reins of government in hand, and which assumed the right to fill the vacancy of the throne.

Correspondence.

PROTECTION WITHOUT MILITARISM.

TO THE EDITOR OF THE NATION:

SIR: As Mr. Bryan is radically opposed to "militarism," one would like to know how he proposes in practice to carry out the third article of his programme for the Philippines, namely, "to give them protection from outside interference while they work out their own destiny," without making very considerable concessions to militarism. Assuming responsibilities of this sort in the Orient would obviously be for us a very different matter from assuming them on the American continent. We should have to be armed with something better than a sword of lath to make our "prave 'ords" respected in an arena which promises to succeed the Low Countries in the doubtful distinction of being the cockpit of Europe, and where the validity of our claims to a right to intervene would be measured, as with other nations, by our ability to make them good *vi et armis*.

E. G. J.

MILWAUKEE, WIS., July 11, 1900.

AUSTRIAN-GERMAN EDUCATION.

TO THE EDITOR OF THE NATION:

SIR: The stringent comments passed upon our American education in a recent number of the *Atlantic* by a German professor, for some years past a member of the faculty of Harvard College, are serious indeed if founded in fact. His criticism contains two major assertions: first, that the German schoolboy learns much more in a given space of time than the American lad; second, that the German not only does this with no sacrifice of health, but with ample time for music, horseback-riding, mountain-climbing, etc., etc. Whether the schools of Imperial Germany differ much from those of German Austria, I know not, not having had much opportunity to observe the schools of Germany proper. A year's residence in Austria, however, has given me some facts which have helped me, though an American teacher, not to be stung too deeply by the above-mentioned indictment of American teachers and ideals of education.

To begin with, one must admit that the Austrian schoolboy who has passed his *Matura* is much farther ahead of the American lad who is ready for Harvard or Yale than the former's added two years of study should warrant. The Austrian has not wasted long hours in the silly effort to sing in unison with 200 other raucous-voiced lads, nor in the even sillier attempt to draw cones and pots and vases. He has learned, with a thoroughness not known to the usual American school, precisely those things which will help him in pursuing a rational university course. He has gained a respect for scholarly attainment that amounts to a desire to know all things. The very first glance at the class-room of an Austrian university brings to mind that unfortunate German parson "recruited" along with Barry Lyndon, who, with a fortune of some odd marks, had learned Greek, Latin, English, French, Hebrew, and Sanskrit, and had a burning desire to acquire Chinese.

If, however, one marks all this, he also marks the distinctively inferior physique of these same much-lettered youths. He learns one of the causes of this inferiority when he finds that, even at the great University of Vienna, where there are not hundreds but thousands of students, the utmost one can do in the way of physical exercise is two hours per week in a small, ill-provided gymnasium, and that it is unwise to work so hard as to sweat in these two hours—because no baths are provided in the gymnasium. The further down in the scale of schools one goes, the more striking becomes the physical inferiority—perhaps because the short trousers of the small boys show their wretchedly undeveloped bodies more forcibly than do their dead-white faces. There is no question but that the Austrian schoolboy is weak to a degree that would shock an American father or teacher.

The German critics of our schools may say that this is due to the poverty of dwelling and of food that marks the life of all Austrians below the upper-middle class. It may be so, but the Austrian teachers themselves admit that the pupils are over-worked. I remember, in particular, a conversation with the Director of a Gymnasium who was much frightened at the ill-health and nervousness of his son. "Our boys are so overloaded with work," he said, "that they are often diseased nervously, and I fear that my boy is getting into that state." It was suggested that two hours' enforced football per day would prove a remedy, but he overthrew this possibility by saying that his boy was too ambitious to give so much time to play, and that if he, the father and the Director, should enforce it, his boy might get a 2 instead of a 1 as his grade. "Then he might blow his brains out," concluded the Director.

The Director's fear was fully justified by the facts of Austrian life, for child-suicide is horribly frequent here. A boy gets a bad report in his examination, and he runs out remarking that he is going to kill himself—a threat only too often put into effect. A fourteen-year-old girl fears that she will be discovered to be the author of an improper note, which the teacher has intercepted, and throws herself out of a fifth-floor window. Another, still younger, does the same thing, because she is not given the full and formal courtesy accorded to her mature sister. It was a rare month this winter when Vienna had not to record at least the attempted suicide of one or more school-children.

These being facts, one may admit that the Austrian child is more learned than his American fellow, and yet hope earnestly that the day is far distant when anything like the Austrian-German's methods and ideals of education shall prevail in America. And are the Imperial German's methods and ideals so very different from those of his brother over the border?

AN AMERICAN TEACHER.

VIENNA, June 20, 1900.

Notes.

'A History of Political Parties in the United States,' by James H. Hopkins, is to be published directly by G. P. Putnam's Sons, who announce also 'A Book for All Readers,' by Ainsworth R. Spofford.

Dodd, Mead & Co.'s autumn announcements include a book of verses by Carolyn Wells, with illustrations by Oliver Herford; 'Wanted: A Matchmaker,' a Christmas story by Paul Leicester Ford; and a series, to be denominated "Bookman Classics," of ornamental editions of 'The Sentimental Journey,' 'Robinson Crusoe,' 'The Scarlet Letter,' and other "principal examples of English prose and verse in pure literature that have successfully stood the test of time."

Macmillan Co. will soon have ready 'The Venetian Republic; Its Rise, its Growth, and its Fall,' by W. Carew Hazlitt.

Henry Holt & Co. will shortly publish a history of France in French for American schools, based by Prof. O. B. Super on Ducoudray and Feillet's 'Récits d'Histoire de France."

'An Alphabet of Indians,' drawings by the late Emery Leavitt Williams, with a descriptive text by Mrs. Williams, is to be published in the autumn by R. H. Russell.

'What We Know of Genesis in the Light of Modern Thought,' by the Rev. Edward Worcester, D.D., of Philadelphia, will appear in the autumn, with the imprint of McClure, Phillips & Co., as will 'The Schools and Society,' by Prof. John Dewey of the University of Chicago.

The Baker & Taylor Company will shortly bring out 'Expansion, under New World-Conditions,' by Josiah Strong; 'The Trusts: What Can We Do with Them? What Can They Do for Us?' by William Miller Collier; 'Short-Story Writing,' by Charles Raymond Barrett; 'The Real David Harum,' by Arthur T. Vance; and 'The Salt-Box House: Eighteenth-Century Life in a New England Hill Town,' by Jane De Forest Shelton.

Mrs. Jane Baldwin, Annapolis, Md., invites subscriptions to 'The Maryland Calendar of Wills'—"a ready, accurate and complete abstract of the wills probated in Maryland from the time of its settlement, 1634, to the American Revolution." The five bound numbers will be sold at $3 singly, or $13.50 for the set, before September 1. The edition will be limited to 300 copies.

Fielding's 'Tom Jones,' in two large volumes of Macmillan's handsome "Library of English Classics," follows the edition of 1750, which was revised by the author, and was reproduced by Murphy in 1762. The present editor, Mr. Pollard, has but a slender bibliographical tale to relate of a work which attained popularity on the instant.

War, which, to the superficial, appears to make demands only on the able-bodied patriot, begins by aggravating the ills of the most needy classes in the community. Sir Henry Burdett, in the preface to his authoritative manual and directory styled 'Burdett's Hospitals and Charities' for 1900 (London: The Scientific Press; New York; Scribners), speaks of the diversion to the South African war-fund of charitable moneys that were counted upon for hospitals. The London institutions, which need annually $750,000 in donations, have found them "almost ceased of late." This is the eleventh year of publication of an admirable yearbook.

The jubilee of Sir George Gabriel Stokes, Bart., has been commemorated by the publication of a volume of 'Memoirs' presented to the Cambridge Philosophical Society on that occasion. It opens with an account of the proceedings at the formal celebration of the jubilee by the University of Cambridge, including a list of the institutions represented and of the delegates. Among the names of persons upon whom was conferred the degree of doctor of science is that of Professor Albert Abraham Michelson.

Following the introductory portion is the Rede lecture, "On the Theory of Luminous Waves: Its Influence on Modern Physics," by Alfred Cornu of Paris. There are memoirs in English, French, and German by Forsyth, Poincaré, Boltzmann, and other eminent mathematicians and physicists. The American contributors are Ernest W. Brown of Haverford College, who writes on "The Solution of a Pair of Simultaneous Linear Differential Equations which Occur in the Lunar Theory," and A. A. Michelson of the University of Chicago, whose paper on the "Échelon Spectroscope" appears to be an uncredited reprint from the Proceedings of the American Academy of Arts and Sciences for November, 1899. A half-tone portrait of Sir George Stokes forms a frontispiece to the book.

On the 29th of June, the faculty of letters of the University of Paris conferred the new degree of Doctor of the University, *summa cum laude*, upon Freeman M. Josselyn jr., A.B., Boston University, '98, being the second American to receive this honor. Advised by the head of the Romance department of Boston University to continue his studies in Paris rather than in Germany, as is customary for American students even when making a specialty of Romance work, Mr. Josselyn at once placed himself under Gaston Paris, Paul Meyer, Antoine Thomas, the Abbé Rousselot, and others hardly less distinguished at the Sorbonne and Collège de France for their scholarship in philology and phonetics. His thesis, 'Étude sur la Phonétique Italienne' (Paris: Albert Fontemoing), consists of 175 large octavo pages, with 232 photographic reproductions of vowel and consonant tests made upon an aluminum cylinder revolving by clockwork, and is a distinct contribution to the subject of experimental phonetics in general, and in particular as applied to Italian. The tongue positions are most accurately shown by means of a large number of cuts reproducing experiments made with the artificial palate, along the same lines as the well-known ones made by Prof. Grandgent in his 'German and English Sounds.' With the exception of the Abbé Rousselot's work in 'La Parole' and 'Les Principes de Phonétique Expérimentale,' no such thorough analysis of experimental methods has as yet been published. At the last meeting of the Board of Trustees of Boston University, Mr. Josselyn was appointed instructor in Romance languages in that institution.

In 1895 Dr. Roman Woerner of the University of Munich published an academical dissertation, or, "Habilitations-Schrift," on "Henrik Ibsen's Jugenddramen," in the preface to which he expressed his intention of preparing an elaborate critical biography of the Norwegian dramatist in two volumes. The first of these volumes, entitled 'Henrik Ibsen' (Munich: Beck), and embracing the first forty-five years of the poet's life (1828-1873), has just appeared. In the introduction the author gives a succinct but very satisfactory survey of the development of Norwegian literature, especially since the separation of Norway from Denmark and its union with Sweden in 1814. Even during the sixteenth and seventeenth centuries, when Norway was politically only a Danish province, the cultivation of Danish literature was promoted chiefly by Norwegians residing in Copenhagen, among whom Holberg, the creator of the modern Danish drama, held the most prominent place. Of Ibsen's immediate predecessors, Welhaven, Wergeland, and his highly gifted sister, Camilla Collett, a brilliant novelist and pioneer in the advocacy of woman's rights, were the most eminent and influential representatives of Scandinavian letters. Dr. Woerner's work is not so much a biographical sketch as a critical study, into which the events of Ibsen's life are skilfully woven. The present volume contains keen and comprehensive analyses of a dozen plays, beginning with "Catiline" and ending with "Emperor and Galilean." The concluding chapter, on "Ibsen's Language and Poems," is extremely interesting from a philological, as well as from a literary point of view. It traces the evolution and distinct nationalization of Norwegian and its differentiation from Danish, with which it was once almost identical, as the result of political independence, and shows the influence of German on Ibsen's style and phraseology. We have also an excellent appreciation of Ibsen's lyrics, many of which are translated.

Mr. Solberg, Register of Copyrights, has just issued the third Bulletin of his office, entitled 'Copyright Enactments, 1783-1900.' This is a very convenient conspectus, going back to the Copyright Resolution of the Colonial Congress, May 2, 1783, which had been anticipated (as an injunction to the States to secure copyright to authors and publishers) by Connecticut with its act of January, 1783. Massachusetts followed suit on March 17, Maryland April 23, etc. Rhode Island copied the Massachusetts act verbatim, even to the preamble. This collection embraces further the Presidential proclamations regarding international copyright.

A more than local serviceability attaches to the new "Finding-List of Genealogies and Town and Local Histories containing Family Records in the Public Library of the City of Boston.' This is the third state of the list published by the Library in October, 1891, as elaborated by the late Arthur M. Knapp and lastly by Miss Agnes C. Doyle; and a further enlargement is contemplated. The present list fills eighty pages in bold display.

The June number of the Bulletin of the New York Public Library continues its publication of Letters and Papers of Andrew Jackson, whose illiteracy and literary incapacity give him a prime distinction among our Presidents. The examples of this in the Bulletin's selection are very amusing. One sentiment in a letter to Major W. B. Lewis, dated March 31, 1824, is as sound as it is now old-fashioned: "I have no doubt if I was to travel to Boston where I have been invited that it would insure my election—But this I cannot do—I would feel degraded the ballance of my life- If I ever fill that office it must be the free choice of the people—I can then say I am the President of the Nation- and my acts shall comport with that character." These be hard sayings for McKinley-Hanna or for Bryan. And again, to the same, January 21, 1825: "I therefore at present can give you no information with regard to the result of the election of President, one thing you will believe, that I will have no agency in unions, combinations, or intrigue to get there."

Mr. J. Henry Lea's "Genealogical Gleanings among the English Archives," now in course of publication in the *New England Historical and Genealogical Register*, are wholly occupied in the July issue with the family of William Penn, and "considerably enlarge and correct the pedigree as hitherto known." An English genealogist, Mr. William Ferguson Irvine, supplies an entry from the parish register of Warrington which may possiby record the marriage of the parents of the Rev. Richard Mather.

In pursuance of research in early abolition history, Miss Alice Dana Adams has traced as far as possible complete sets of (a) the Minutes of the twenty-one sessions of the American Convention for Promoting the Abolition of Slavery, etc. (1794-1829), and (b) Benjamin Lundy's paper, the *Genius of Universal Emancipation*. In no one place does she find all together, but as a convenience to fellow-students and for further aid in turning up the third volume of the *Genius* (June, 1823-October, 1824), nowhere discovered, Miss Adams prints her lists, with whereabouts, in the July number of the *American Historical Review*. Her address is No. 93 Hancock Street, Auburndale, Mass.

The "Boxer" Society is described by Mr. L. J. Davies, in the *National Geographic Magazine* (Washington) for July, apparently from information derived from Chinese sources. The organization is divided into local "ying," or encampments, which meet regularly for drill, the recitation of incantations, and the initiation of new members. If the rules are strictly obeyed, the members become invulnerable, according to the popular belief, against bullets and knives. "Several intelligent Chinese have told me that they had themselves seen advanced members of the society strike different parts of their bodies with sharp knives and swords, with no more effect upon the skin than is produced by the wind." If any are killed, it is because they have broken the rules, as, for instance, by eating certain proscribed articles of food. Mr. W. E. Curtis concludes his account of his South American trip by sketches of some of the peculiar features of the cities of Cuzco and La Paz. A curious village scene was that of a row of ten or twelve women squatting in a churchyard facing an equal number of surly looking men. "Between the two was a rude cross, held upright by a few stones laid against its base and trimmed with artificial flowers." The men "were charged by their wives with drunkenness, abuse, neglect, and improvidence, and the village priest would hear the evidence, render judgment, and administer correction the next morning at eight o'clock"; the correction consisting of a beating for the worst offenders, and various forms of penance for the others.

Milton's "two-handed engine at the door," in his 'Lycidas,' is plainly enough a sword, and the allusion can hardly be said to be relieved of its obscurity by citation of a possible source of the image. A correspondent in the *Athenæum* of June 30 compares a passage from Sylvester's Du Bartas (1621), which describes the effective "two-hand sword" of

> "A sacred Fencer 'gainst the Assyrians sent"

by the Almighty; there being a marginal reference to the smiting of the camp of the Assyrians in 2 Kings xix. 35.

Dr. Otto Braun, who died at Munich on June 10, was one of the twenty-four literary men portrayed in Paul Heyse's 'Das litterarische München,' and for nearly a score of years a prominent figure in the intellectual and social life of the Bavarian capital. He was born at Cassel, August 1, 1824, and devoted himself at first to the study of law and afterwards to that of history and literature in the Universities of Bonn, Heidelberg, and Marburg. As a student, he took an active part in the Revolution of 1848 in Hessia, where this movement was strongly provoked and greatly needed. In 1850 he was forced into exile by the return of the reactionary party to power, and spent several years alternately in Paris and Madrid. In 1860 he joined the editorial staff of the Augsburg *Allgemeine Zeitung* (transferred to Munich in 1882), and was editor-in-chief of this influential journal from 1869 to 1889. His tastes and talents led him to give special attention to the *Beilage* (literary and scientific supplement), which he brought to a remarkable degree of perfection and continued to conduct till 1891. Since that date he had edited the *Musenalmanach*, published by Cotta in Stuttgart, a revival of the famous annual issued by Schiller from 1796 to 1801. Dr. Braun was an ardent lover of Spanish literature, and his volume of poems, entitled 'Aus Allerlei Tonarten,' of which a second enlarged edition appeared in 1898, consists in part of excellent translations from the Spanish. His villa in Munich he bequeathed to the Schillerstiftung for the benefit of needy authors.

—*Harper's* for July has an illustrated article on "English War-Correspondents in South Africa," by Fred. A. McKenzie. Of these, Mr. Steevens was, perhaps, the only one who attained any professional distinction. Mr. Winston Spencer Churchill "added greatly to his laurels," but then his laurels are not purely literary; he is a politico-social figure, besides being a soldier, and "already one hears mutterings from young men, tired of the older political parties, who look to him to lead them in a new political movement." Neither of those two represents the latest type, which is hard to describe, but which is well known. It is hit off here as the man-ready-to-start. He has two outfits, ready either for high or for low latitudes, both of which are kept packed. If there is to be a coronation, say, in St. Petersburg in the middle of the winter, and his employer wires him, "Go to St. Petersburg," he wires to his faithful wife or housekeeper, "Cold bag; Charing Cross, twelve o'clock." If, on the other hand, the "trouble" is in South Africa, he wires, "Hot bag," instead of cold bag, and enters upon his mission. To this it should be added—and anybody may verify the statement by reading what he writes—that in nine cases out of ten besides energy in locomotion, willingness to take risks, and fluency, no moral or intellectual equipment whatever is required of him. Publishers, it is said, are wondering why "khaki" literature has fallen so flat. One reason is that good reading cannot be produced in this way, and yet the war correspondent is only the exaggerated type of a lately evolved species of magazine and newspaper writers, who possess the art of working up subjects to order at a moment's notice. In the same number of the magazine is a second instalment of "A Journey to the Abyssinian Capital," by Capt. M. S. Wellby. Outside the pictorial illustrations, there is almost nothing in it that adds to our knowledge of Abyssinia; tons of stuff of the same weight and texture appear in the magazines about out-of-the-way places, all the year round. James Buckham's two pages on "Nonhygienic Gymnastics" are worth reading, as is "To-day's Science in Europe: Prof. Ernest Haeckel and the New Zoölogy," by Dr. Henry Smith Williams. In the latter the writer justly says that the question "why" either man or the Pithecanthropus "evolved at all" is as yet unsettled by the new zoölogy.

—*Scribner's* leading article is on "The Slave Trade in America," the first of a series of papers by John R. Spears, with illustrations by Walter Appleton Clark. Mr. Spears shows historically that the slave trade, as it originally existed in Africa, was a mild and humane commerce compared with what the white man made of it in two or three generations. As soon as it became apparent—towards the middle of the last century—that the West India market for slaves was a steadily increasing one, the white slavers (who had hitherto been unwilling to do more than incite the natives to bring in slaves, of whom they were assumed to have the right to dispose) began themselves to organize slave-catching raids. In these the whites developed a really extraordinary capacity for treachery and crime of the most revolting character. It is a horrible chapter in the story of human greed, and worth retelling from time to time, "lest we forget." A noticeable article on "Trees," by Frank French, is accompanied by interesting illustrations drawn and engraved by the writer. The paper which will, perhaps, attract most attention is Senator Hoar's "Harvard College Fifty-eight Years Ago," which contains sketches of many noted men—Professor Channing, Dr. Walker, Dr. Beck, "Old Quin," Professor Sophocles, and others, with some good anecdotes. Oddly enough, the writer declares his opinion to be that the one member of his class (and it contained a good many men of distinction) whose fame will last to "remote posterity" is Walter Mitchell, author of the poem, "Tacking Ship off Fire Island." The article is interesting as a picture of the college in the period just before the present, when it was more or less a type of the American college as it had existed for a hundred years, when it was still a denominational institution, and electives were not, and freshmen were boys of fourteen. It is amusing to read that in that day the professors did nothing to "encourage familiarity," or even to encourage any request for assistance in study. "Indeed, a boy who did that fell into disfavor with his companions, and was called a fish."

—Richard Whiteing's articles on "The Paris of To-day" appearing in the Century, are, it may be presumed, to come out as a book. No one could fail to find in them something to arouse his attention or add to his stock of information. It is, of course, France seen through Anglo-Saxon eyes; but then, no Anglo-Saxon will ever see it by means of any other species of eye. In "Artistic Paris," Mr. Whiteing gives his account of the serious side of a life of which a somewhat different view is to be obtained in 'Trilby.' What he insists upon is that, in Paris, art is a profession, a guild, to which one who enters upon it devotes himself as with us to law or medicine. "A lad who goes to school at the London Royal Academy goes for his teaching and no more. He still follows his earlier way of life and his social traditions, and his day's work is only one of the things of the day." On the other hand, a lad who enters the Beaux-Arts, at once belongs to a students' corps. "He is a new man. The tomfooleries of the reception by the class—so often described—have still a meaning. It is not merely that the freshman has to sing a song by order, to do the meanest 'chores,' and generally to make an ass of himself. The real purpose is to take the nonsense of mere individualism out of him, and to make him feel that, hereafter, he belongs to a fraternity." Mr. Whiteing also discusses literary art as practised in Paris, and draws an amusing parallel between the English (and American) "gentleman" and the French ideal of the perfect writer. We have bothered our heads, it seems, from Chesterfield to Thackeray, with the perfection of conduct; troubling ourselves but little with literary art; while the French, in the same period, indifferent to character, have been perfecting a theory of style. "Our greatest stress of admiration lies in the domain of manners; theirs in the domain of the arts." We all know that a gentleman is full of consideration for others, a foe to violence of opinion or expression, an enemy, at the same time, of restraint, suspicion, gloom, or resentment. He is merciful, gentle, and tender; avoids unseasonable allusions or topics; never makes himself prominent in conversation, and suppresses his own egotism. He makes light of favors which he does, and seems to receive while he confers. He is scrupulous in imputing motives, never mean or little; never takes unfair advantage, and never mistakes personalities or abuse for argument. Such is our ideal character. It is an almost complete analogue of the French ideal of style. This is what the Academy preaches; for the preservation of this tradition, among others, the Academy exists. The tragedy of French letters is, however, "that the balanced man has gone out of fashion, and that the shifting, wayward million has come into the judgment-seat. These law-givers of an hour, careless of what is true, ever demand something new, and the popular writer prefers a first place in the meanest village to a second in Rome itself." Hence, realists, naturalists, and "naturists," and decadents, and symbolists, and a host of other ephemeridæ; but the Academy still stands, and maintains the style and tradition of true art.

—The *Atlantic* contains Mr. Cleveland's second and apparently final instalment of "The Independence of the Executive." He has shown how the Senatorial encroachments of the Johnsonian period were followed, in his own time, by the "expurgation of the last vestige of statutory sanction" to such encroachments. The papers are good as far as they go, but need to be supplemented by a survey of other periods. We have seen, within the last four years, a resurgence of Senatorial arrogance, and to a certain extent an abdication of executive function with regard to the appointing power; though, of course, the encroachments made during the struggle between Johnson and Congress differed from those which have been seen since in the fact that, in the reconstruction period, there was a deliberate attempt to make them permanent by statutory means. Even to-day, a really vigorous man in the White House might restore the office to its pristine dignity and importance. Prof. Lewis E. Gates writes about "Impressionism and Appreciation," and exhibits his views of modern criticism of literature. It appears that the history of literary criticism, from Addison's day to our own, is, if viewed in one way, "the history of the ever-increasing refinement of the critic's sensorium." It is the history "of the critic's increasing sensitiveness to delicate shades of spiritual experience in his reaction on literature"; and, finally, it is the history of "a growing tendency on the part of the critic to value, above all else, his own intimate relation to this or that piece of literature"—a tendency that more and more takes the form of prizing the fleeting mood, "the passing poignant moment of enjoyment in the presence of art"—"until at last certain modern critics refuse, on principle, to feel twice alike about the same poem." So far have we travelled since Addison's time, and indeed since day before yesterday; for, in the light of impressionism, what was poor Matthew Arnold with his canons of criticism, and his insistence on "seeing the thing as it is," but a dullard? He who once highly resolves never to feel twice alike about the same poem, has indeed solved the riddle of criticism. Mr. Howells is at his best in "A Difficult Case."

—Dr. James MacKinnon claims for his 'History of Edward III.' (Longmans) "the merit of a conscientious study of the materials bearing on this important period of English history." He even goes further: "I shall be disappointed if the critic does not agree with me that the work may claim to be an independent contribution to the history of Edward III." In support of his plea for consideration, he points to the footnotes where references to Rymer's 'Fœdera,' various volumes of the Rolls Series, the principal French chroniclers, Villani, etc., shine forth in great brilliance and profusion. We shall not deny Dr. MacKinnon the merit of having read widely during the period of preparation, but when he comes to writing, he is afflicted by a touch of jauntiness which is undeniably irritating. Were his book originally published in New York, more than one English review would condemn it for abuse of the English language after the fashion usual with Americans. As it is, we can only say that the style often approaches more nearly to slang than we should expect a professed work of erudition, published in Great Britain, to do. "The Bishop of Lincoln did a roaring business"; "it was a good dodge"; "renewed inward risible shakings"; "had John Bull [*passim*] resolutely brought down his fist"—such expressions are constantly used in the hope of lightening the text. With the same view to picturesqueness, the exclamation mark is profusely employed, and on p. 614, where Dr. MacKinnon quotes an opinion of Hallam on fourteenth-century chivalry, three notes of interjection are put in line one after another. Altogether, on pp. 614-15, six of these signs of excitement appear. We may mention one or two other irregularities, or inconsistencies, which become apparent at the first reading. While we admit the difficulty of being rigidly consistent in the spelling of European proper names, the following *mélange* of forms on the same page, 105, seems singular: "Ludwig of Bavaria . . . the electorates of Cologne, Treves, and Maintz." On p. 461 the same person is styled "Abbé de Clugny" and, a little lower down, "Abbot of Clugny." Many things show that Dr. MacKinnon has a facile pen, but "easy writing" has been properly estimated in a celebrated epigram. Regarding this work from the standpoint of serious history, we may state that it is almost wholly a narrative of events in which the relations of England with Scotland and France occupy the prominent place. Despite the array of footnotes, it could not have been an arduous work to complete. It is a useful account of the reign, based for the most part on the chroniclers; but it hardly justifies the tone which the author takes in the first paragraph of his preface.

—'Die Renaissance in Florenz und Rom,' by Karl Brandi (Leipzig: Teubner; New York: Lemcke & Buechner), is a neatly printed book containing eight essays—four on the early Renaissance at Florence, and four on the Renaissance in its full maturity at Rome. Though popular in form, these studies are the productions of a scholar who knows the writings of Burckhardt, Voigt, and Gaspary (besides something of their sources), and of a critic who has followed the development of Italian art, historically, through all its phases from Giotto to Michelangelo. The treatment is largely biographical, for the author never loses sight of the individual master when discussing the part of the great movement with which he is connected. The central idea is, that the Renaissance can be best understood through a knowledge of its manifestations at the two capitals which, by common consent, stand forth most prominently in the intellectual life of Italy during the fifteenth and sixteenth centuries. In his Florentine chapters Herr Brandi takes up Dante and the End of the Middle Ages, Florentine Society and Humanism, the Artists of the Fifteenth Century, and the Sway of the Medici. The Roman topics are the Principality of the Popes, Raphael, Michelangelo, and the End of the Renaissance. The characteristic feature of the book is a method which involves the presentation of many important points as well as persons, with a consequent compression of what is said concerning each. A large number of the really important subjects are considered in a way which is both clear and brief without being bald. We have nothing in English of a corresponding nature, and it would be well if we had—an introduction to the Renaissance which should condescend to give some distinct statements of fact, yet contrive to reach a higher level than that of the ordinary manual. Herr Brandi has written a book which no beginner would find difficulty in mastering, and which readers of Symonds and Pater could not call hackneyed. Lacking a volume of similar stamp in our own language, we should be pleased to see a translation of these lucid and attractive essays.

PALGRAVE'S DICTIONARY OF POLITICAL ECONOMY.

Dictionary of Political Economy. Edited by R. H. Inglis Palgrave, F. R. S. Macmillan & Co. Vol. I. A-E. 1894, pp. xv, 800. Vol. II. F-M. 1896, pp. xvi, 848. Vol. III. N-Z. 1899, pp. xxii, 762.

The completion of Mr. Palgrave's arduous undertaking, the successive stages of which have been noticed from time to time in these columns, presents a convenient occasion for a general survey of the work and for some account of its scope and character. This is the more desirable because, owing to the piecemeal method of its publication, it may perhaps not at first secure the success which it unquestionably deserves.

Mr. Palgrave's Dictionary is one of the most interesting evidences of that revival of economic studies in England which marked the beginning of the decade just come to an end. It was in 1890 that the British Economic Association was founded; and if this has done little more than support the *Economic Journal*, it has thereby performed a most useful service. It was in that same year that Mr. Palgrave, known among economists hitherto chiefly for his writings on banking, set about creating for English readers an economic encyclopædia worthy to be placed by the side of those of Conrad and Chailley. Dictionaries of this sort must always be somewhat unsatisfactory; the articles can hardly fail to bear the marks of writing to order; and statistics and bibliographies soon become antiquated. And yet they may be helpful for a good many years to several distinct classes of readers; and that which bears Mr. Palgrave's name is certainly in some respects more valuable than those of his French and German rivals.

For purposes of comparison we may quickly put on one side the 'Nouveau Dictionnaire' of Say and Chailley. That is avowedly the manifesto of a school, "a small group of collaborateurs united in a common doctrine," of whom "none has written a word without having come to an agreement with the editors as to the main outlines of his teaching." Unity might be strength, were it not that "the common doctrine" suffers from the incurable superficiality of thought, the invincible satisfaction with a narrow range of ideas and information, which have gone far to destroy the influence of the *Journal des Économistes* and the circle associated with it. Conrad's 'Handwörterbuch' is far more scholarly in its execution as well as more catholic in its contents, and this last in spite of the allotment of the article Political Economy to Professor Gustav Schmoller, the leader of the historical school. In these respects the German and the English dictionaries stand on the same level. The prevailing tone in Conrad, indeed, is that of the German historical school; the prevailing tone in Palgrave is that of what—simply for convenience—we may call the moderate orthodox English tradition, as it is represented by such a writer as Professor Marshall. Mr. Marshall, it is true, has not himself contributed to Palgrave's pages, but his influence is evident in several of the younger men who have written here, especially, of course, in the theoretical articles, as, for instance, that by Mr. Johnson on Supply and Demand.

Mathematical economics, though they have scarcely any vogue in England, are treated with great respect, partly, no doubt, because they do but attempt to formulate and carry further, by the use of a special organon, the customary method of deduction from a few abstract premises; partly because of the part Professor Edgeworth has himself taken in the preparation of the Dictionary. One of the most noticeable features of the book is the series of articles by Professor Edgeworth on Cournot, Dupont, Gossen, and Fleeming Jenkin, and on Curves, Functions, and Mathematical Method. But the historical economists are treated with kindliness, and even permitted to contribute an occasional article. They are shown their proper place with unmistakable emphasis by more than one of their collaborateurs; and a singular error is frequently imputed to them, namely, that "the mere accumulation of economic facts constitutes political economy" (iii., 556). Still, the policy of the Dictionary is to be scrupulously fair, and on the whole it succeeds in its purpose of "enabling the student to understand the position of economic thought at the present time."

If we may continue to compare it with Conrad's 'Handwörterbuch,' we may next notice that, in spite of its far more restricted space, it contains many more articles. Thus, even the new edition of Conrad has only 122 entries under A, while Palgrave has 206. The larger number is brought about, partly by the splitting up of many of the main rubrics of economic treatises into a number of separate topics; partly by the inclusion of a group of articles on legal subjects and on matters of political theory; partly by the addition of a series of definitions of terms used in business, such as Average (maritime) or Charter party, or occurring in historical treatises. Of necessity, then, the articles are much briefer than in Conrad; and, as a result, the work remains truer to its name of Dictionary, and does not become, as Conrad's volumes tend to do, a series of monographs. And although not a few of the entries are open to criticism, if for no other reason than that no one would think of looking for them—as, for instance, Facts, Forethought, Habit, Good for Trade, Observation, Optimism, and Pessimism on the side of theory, and such trivialities as Churchseed and Fish-silver on the side of history—still, the number and brevity of the articles will make the Dictionary a very handy work of reference for the shelves of every economist and financier.

It is, perhaps, an open question in what way disputed questions of theory should be handled. Most of those under the earlier letters are from the pen of Professor Nicholson of Edinburgh; those under the later are mostly by younger men, and show the growing influence of Professor Marshall's treatise. It may, however, be urged that, in a work of this kind, it is fair to give one view without any indication of opposing theories only when that view is practically in possession of the field among competent economists. This is a rule pretty consistently observed in these volumes; it is the greater pity, therefore, that the article on Distribution, Law of, from the pen of an American economist, Prof. J. B. Clark, should be confined to a brief exposition of Professor Clark's own views. And while we are referring to questions of theory, attention may be called to the curious circumstance that, in spite of the constant affirmation throughout the Dictionary of the prime importance of theoretical inquiries, it does not contain any article on the theory of wages beyond an historical and critical account of the wage-fund doctrine. This is probably a mere oversight, but we can imagine an historical economist making merry over it.

There are many excellent articles on social history, including some contributed by Professor Maitland, and careful and sober articles on fundamental institutions, like Property, many of them by Professor Montague. Indeed, there is good reading of many sorts. But the scholar will find the chief excellence of the Dictionary in another and rather unexpected direction, and that is, in the series of biographical articles. Of some of them, especially on the minor figures, the preparation has involved a good deal of original investigation, with the not unnatural result, under a lenient editor, that the text has sometimes been burdened with details and references quite out of place in such a work. Others, again, are broadly planned surveys of great writers, some of whom find themselves for the first time treated seriously as having influenced economic thought. As none of the indices, including the elaborate topical one at the end of the third volume, assign the articles to their several writers, it may be well to give a list in this place of the more considerable pieces of work of a biographical-critical character. The judgments expressed are sometimes of doubtful validity, and a common fault is to exaggerate the importance of individuals through sheer ignorance of the contemporary environment. But all the articles in the following list possess merit of one sort or another.

Professor Edgeworth, then, besides those already mentioned, furnishes articles on James Mill and John Stuart Mill (with an analysis of the latter's 'Principles' and a running commentary); Mr. James Bonar on Babbage, Bentham, Chalmers, Cobbett, Comte and English Political Economy, Hermann, Hegel, Kant, Locke, Malthus (19 columns), and Adam Smith (with an elaborate analysis of the 'Wealth of Nations,' occupying 18 columns of minute type); Professor Ritchie of St. Andrews on Aristotle, Grotius, Locke, Plato, and Savigny; Professor Gide of Montpellier on Roman Catholic School of Political Economy, French School, Proudhon, J. B. Say, St. Simon, and Vauban. Dr. Ingram of Dublin besides a number of brief notices of minor German writers which are practically transcripts from Roscher, writes on Lassalle, List, Marx, Positivism, Rodbertus, Stein (Freiherr vom), Steuart, and Thompson; the late Professor Dunbar of Harvard on Carey, Dana Horton, and Francis Walker (the last an exemplary article in substance and form; *O, si sic omnes!*); Professor Oncken of Berne on Iselin, Mauvillon, and Roscher; Professor Ashley of Harvard on Aquinas, Rowland Hill, Historical School of Economists, Luther, Oresme, and Vives; M. Castelot on Gournay, Pufendorf, Rümelin, Spanish School of Political Economy, and Uztariz; Mr. J. D. Rogers on Owen, Tucker, Swift (an attempt to justify his 'Drapier's Letters'), Temple, and Violet; Professor Montague of University College, London, on Hobbes, Toynbee, and Tocqueville; Professor Lindsay of Philadelphia on Hildebrand, Soetbeer, and Amasa Walker; Miss Foley (Mrs. Rhŷs-Davids) on Rousseau and Vanderlint; Mr. Henry Higgs on Cantillon, Le Play, Mirabeau, Turgot; Dr. Bauer of Vienna on Barbon, Cantillon, and *Ephémérides;* Mr. H. E. Egerton on Hume, Leclaire, Maurice, Senior, and Whately. The following writers contribute one biographical article apiece worth mentioning here: Mr. Crump of the Record Office on Fustel de Coulanges; Professor Dewey of Boston on Hamilton; Miss Dixon on Massie; Dr. Devine of Philadelphia on Daniel Webster; Professor Gonner of Liverpool on Ricardo; Professor Greven of Leyden on Dutch School of Economists; Professor Hewins on Mun; Miss Law on Lord Sheffield; Mr. Keynes of Cambridge on Cairnes; Professor Loridi of Padua on Italian School of Economists; Miss McArthur of Cambridge on Charles Kingsley; Professor Miklachewsky of Kharhoff on Russian School of Political Economy; Professor Nicholson of Edinburgh on his predecessor, Hodgson; Mr. A. L. Smith of Balliol on Yarranton; Mr. Sanger on Leon Walras (the one living economist admitted), and Mr. Wicksteed on Jevons. To Mr. Palgrave himself we are probably indebted for the estimate of Bagehot and for the elaborate footnote on Whewell; some of the shorter footnotes, also apparently due to the editor, might, however, have been omitted with slight loss. It will have been observed that many of the names in this list are of foreign scholars, and the articles contributed by Professors Dunbar, Gide, and Oncken are especially workmanlike. The same can hardly be said of the biographical notices by M. Courtois, "formerly Secrétaire Perpétuel de la Société d'Économie Politique de Paris," who seems to have set himself to justify the strictures of his countryman, M. Gide, on the Parisian economists. He cannot write the briefest notice without sermonizing and without measuring his subject by the yard-measure of orthodoxy. His article on Wolowski, however, is a useful statement.

As the above list shows, American scholarship is well represented in the Dictionary. Besides the articles already enumerated, attention may be called to those of the late President Walker on Money (17 columns); of Professor Mayo-Smith on Immigration, Statistical Method, Wages, Statistics of (in America), and Workmen's Budgets (in America); of Professor Taussig on Inflation in the U. S., and Stationary State; of Professor Jenks on Homestead Laws, Local Government in the U. S., and Monopolies; of Professor Lindsay on Latin Union, Monetary Conferences, Precious Metals, Prices, and Silver; of Mr. Graham Brooks on State Insurance in Germany; of President Hadley on the Interstate Commerce Law; Professor Seligman on Graduated Taxation; and Professor Andrews on the Land System in the American Colonies.

Enough has been said to show the very real value of this Dictionary—the worthy result of Mr. Palgrave's assiduous employment of all the leisure he could spare from the duties of a country banker for a period of twelve years; persisted in in spite of many obstacles, and, in these latter years, as a solace in the midst of grief. It would be possible to say a good deal of the unevenness of the work, and of various little defects in editorial art. But most of these are the results of Mr. Palgrave's (possibly excessive) urbanity and patience. The work is in most respects—and especially as a tool for the constant handling of the scholar—so signally successful, and, where it is deficient, its defects are so largely those of the contemporary English and American scholarship which it reflects, that the reviewer does not feel inclined to conclude with anything but an expression of gratitude.

Boys and Men: A Story of Life at Yale. By Richard Holbrook. Scribners.

Smith College Stories. By Josephine D. Daskam. Scribners.

Kate Wetherill: An Earth Comedy. By Jennette Lee. The Century Co.

A Friend of Cæsar: A Tale of the Fall of the Roman Republic. By William Stearns Davis. The Macmillan Co.

Mr. Holbrook's 'Boys and Men' is a clumsy effort to foist a love plot on a study of manners, with the help of a narrative style lacking in finish and certainty. As a consequence, readers who do not find the matter uninteresting are likely to find the manner intensely so, and a few unhappy mortals will be repelled by both. There seems to be no lack, however, of good intent on the author's part. He tried to deal out even-handed justice to all sides and aspects of Yale life and character. Logically, indeed, his work might be described as an attempt at complete enumeration, with all the pitfalls and dangers incident to that method of demonstration. But the incidents lack reality, the characters lack the one touch of nature, and the whole lacks the nameless grace that we call, for want of a better term, literary quality. A certain coarseness, too, flavors the whole book, making itself most painfully felt, not in characterisation, nor even in efforts at dramatic effect, but in passages of description.

Miss Daskam's title is a misnomer, its preface is misleading; for the stories are not simple, and they are not about Smith College. If, indeed, it be possible that there is in the world of fact or fiction a place satisfactorily known as Smith, these or any other stories might find a suitable setting there. A college by common consent is an educational institution; it has a faculty, a course of study, aims, purposes, discipline, and ideals. These are the background of the happenings we are pleased to call stories of the collegiate type. In Miss Daskam's book they are all conspicuous by their absence. There is always in evidence a swarming, excited, and exciting crowd of young women, low-shoed and shirtwaisted, intent on "making" clubs, elections, societies, successes of all sorts, except the academic, and desperately sensitive to the criticism of everybody except the faculty or officers of government. These are some three or four times incidentally referred to as the natural butts of student wit, the pivot of a clever epigram, or the casual reference for a low-spirited estimate of faculty intelligence and integrity. As studies in local color, allowing for this fundamental inaccuracy, the stories fall into three classes—such as might have happened anywhere, such as might have happened at "Smith's," and such as could have happened nowhere. It is only fair to the business interests of the author to leave her readers to make their own assignment to these classes.

For the rest, the stories have a certain rhetorical tang and go, due to a clever manipulation of verbal associations, quite the reverse of the simplicity promised in the preface. The intending reader may be sure of interest that will keep him expectant until he possibly sees through the illusion so elaborately constructed for him, or more likely comes to the end of the collection and drops the volume into the list and limbo of books for summer reading. And yet we are told that this prophet is not without honor in her own country, that her picture is accepted by graduates and students of Smith College as a truthful and, above all, a sane one. We fancy, however, that none of them would maintain that this is the book they are looking for about any woman's college, still less about their own. In avoiding some undesirable features in her picture, the author has unquestionably omitted some capital and essential ones.

The little red book of scant two hundred pages, 'Kate Wetherill,' is not content with the paraphrased allusion of its double title to Dante's poem. It is in three parts, headed Hell, Purgatory, and Paradise, and it quotes from the epistle to Can Grande in justification of its matter and manner. This use of Dante, not to mention an unacknowledged quotation from Browning, is quite unjustified by anything in the story. At least we were forthwith impelled to wonder why the author had not advertised her wares by reference to Milton, and cited for their interpretation passages from the 'Areopagitica' and the tractate on Divorce. Kate Wetherill would certainly have gone far to explain the grounds of Milton's most extreme theories on divorce, while certain passages of the 'Areopagitica' can always be depended on to divert attention from a particular book to books in general. But the honest reader must come to the book itself after all the references, comments, and dedications; and when he asks himself what he has before him, he will, if he is one of the plain people, probably say, a very disagreeable story about very disagreeable and very strange persons. If he is one of the custom-made readers of modern literature, he may call it strong; and if he is, without fear or favor, simply a story-reader, he will complain that the plot broke down in the middle and left him with a pathological study of nervous prostration for all his consolation. The more observant critic of literary method shares all these experiences by turns, and adds to them a keen consciousness of several other equally curious and conflicting motives appearing and disappearing in the book like the nervous rabbit of a prestidigitator's show. The pathological interest of the latter part of the story perhaps accounts for the use made of bedroom scenery in the opening. Indeed, since 'Robert Elsmere,' we remember no such strain on bedroom manners. Mrs. Ward, it is true, left them hardly more than a suggestion of the night side of the human spirit. Mrs. Lee has accepted all the implications of clayey tabernacles, and wrung the last drop of disgust out of a snore.

There is no reason why Greek and Roman life should not furnish the material for a large amount of fascinating fiction. If we have but few really great works in this field, the explanation is to be sought not in the poverty of the field itself, but in the fact that so few great writers have cared adequately to master the resources at hand. It can hardly be said that the famous 'Quo Vadis' displayed a complete mastery of its materials, but it had sensational elements of a nature to insure success in the market entirely apart from its fidelity to the canons either of historical truth or of literary art. Mr. Davis, to judge by his 'Friend of Cæsar,' is apparently not fully aware that the novel cannot take the place of the 'Classical Dictionary,' even with the aid of an elaborate outfit of footnotes. His love story, which is really good, would have run the race for popularity with better chance of success if its feet had not been thus encumbered; and the body of the work, too, might well have been lightened by the omission of much that apparently owes its insertion rather to a desire to furnish useful knowledge of classical antiquities than to its essential relation to the story. Some of the more animated scenes are admirably done, though the style of the book as a whole cannot be said to possess any marked degree of excellence. Of well-known historical characters presented, Cæsar is the most prominent, but Mr. Davis's conception of him cannot, for a moment, be considered as a genuine picture of the Cæsar who has come down to us in Roman history and literature. Mr. Davis blunders in no slight degree in supposing it necessary occasionally to halt and apologize for his really noble pagan characters, because they do not act as consistent Christians would have acted under similar circumstances. The reader who is not liberal enough to make due allowance for himself in such cases will hardly be propitiated by the author's special pleading. There is one passage in the book which should gain for it an honored place on the shelves of the White House. It is where Cæsar is made to say, "I have slain a hundred thousand men in Gaul. Cruel? No, for, had they lived, the great designs which the deity wills to accomplish in that country could not be executed!" Mr. Davis is young, and most of the flaws in his work are of such a nature as might readily yield to study and experience. He may yet do distinguished work in the classical field, and we hope that he will not abandon it after a single trial.

The Practice of Typography: A Treatise on the Processes of Type-making, &c. By Theodore Low De Vinne. The Century Co. 1900. 12mo, pp. 403.

The close of the century is a peculiarly fit time for a survey of the present state of the printer's art, something in the manner of Moxon's 'Mechanick Exercises,' so admirably edited by Mr. De Vinne. But there is no time in which an intelligent and would-be cultivated person ought not to welcome the present book. It is small, compact, a triumph of mechanical skill, and abundantly attractive to the eye. The information it conveys is lucidly stated in the fewest possible words. The subject is one as to which much ignorance and small curiosity prevail, even among the educated, and even in respect to the larger features of the craft. It would be pedantic to exact that one should know the ten names of the parts of a type-letter (p. 29); but what type are, in appearance, size, and composition, and how they are made, ought to be common knowledge—all the more because of the comparatively small changes in processes since the art began.

Having learned that the type-body is about an inch long, one may easily be induced to read in Mr. De Vinne's volume (p. 131) that, more exactly, the American standard "height to paper" is eleven-twelfths of an inch; and so nearly in accord with the English standard that English type can be mingled with those from American foundries, whereas French, German, and Russian type are higher, and importation and use of them are practically cut off. And if the international comparison attracts, there is the further particular of manufacture (p. 31) that the "nick" or transverse groove in the shank or body of the type is in front in American, English, and German type, at the back in French. Then there are tables (pp. 54-56) showing the names of the several classes of type in various countries, with "paragon" and "nonpareil" alone identical everywhere. "Pica," "long-primer," "brevier," point to an origin in ecclesiastical printing; "bourgeois" is perhaps named from the French city of Bourges (p. 66). But the names of the letter-face do not, in the latitude of the founder, coincide invariably with those of the body of the type; and this leads up to the nice matter of ordination of bodies by "points," the French Fournier leading off. His "point" or unit of vertical facial dimension was substantially that now adopted by the United States Type Founders' Association, viz., .0351+ centimetres, whereas Ambroise Firmin-Didot's substitute for Fournier is .0376+ (p. 155). The Association in question based its point on the "pica" of one of its members, the MacKellar, Smiths & Jordan Co., and Mr. De Vinne, in a footnote (*ibid.*), makes it appear probable that this firm, by inheriting Franklin's type-founding tools derived from Fournier, was instrumental in establishing here the latter's standard "point." More comprehensible to the average reader wholly unfamiliar with the technics of the printing-office are such items as that one hundred small type may be cast in a minute (p. 22); that "a large octavo page of long-primer type weighs about ten pounds, and its types are worth about three dollars" (p. 40); that a "font" (or unit of assortment) of new type, when "set out" (*i. e.*, set to the point of falling short of some character), shows about one-third of its weight remaining unused in the "case" (p. 168); and that one reason why type-founders in their specimen-books so long reproduced Cicero's Catilinian *Quousque tandem* passage was, "that Latin, as compared with English, had an excess of small and a deficiency of ascending and descending letters," so that the Latin text "had a more symmetrical look and an evener line than could be produced from an English text" (p. 44). And here is a typographic argument, which might well be heeded by Gutenberg's countrymen, in favor of the universal adoption of the Latin character (p. 185):

> "With italic capitals and italic lower-case added, there are five series in every complete font of our selected [Roman] text-letter. This is a peculiarity not found in any other literary character. The older form of orientals have one series only; the modern forms of Greek, German, and Russian have but two. The capitals of German are too complex to be used alone as a display letter for titles or headings. Emphasis or display in German is made in the text either by hair-spacing the emphatic words, or by the use of an entirely different font of thick-faced letter. The poverty of all other alphabets in single or double series is in marked contrast with the affluence of the five correlated series of the roman alphabet, which enable the writer or printer to make emphasis, display, or distinction without change of size or the violation of typographical propriety. The judicious alternation of capitals, small capitals, italic, and lower-case makes printed matter readable and rememberable."

We are still far from having disclosed the full interest of Mr. De Vinne's manual. There are two main divisions, one the exemplification of the sizes of type by a most ingenious method; the history of printing and type-founding being related in gradually diminishing fonts, and closing with a very laborious and valuable chronicle of American type-foundries. Similarly, in a detailed examination of types of modern face, are intercalated framed biographies of noted printers, engravers, press-makers, and founders. The way in which all this has been fitted to the printed page is a marvel of editorial and mechanical accommoda-[illegible]. An admirable index makes this mass [illegible] istory and biography completely available, besides unlocking the other parts of the treasury. Those who know Mr. De Vinne's views as to the hair-line will expect to meet here, *passim*, with his *Delenda est*; and his book cannot fail to draw to his side, at least for book work (job and fancy work being a law to itself), designers and founders who, with a due regard for readers' eyes and for the printer's pocket, will strive to produce characters legible to old and young, and capable of enduring the batter of handling and press-work.

Travels in England. By Richard Le Gallienne. John Lane. 1900.

This is a far more profitable book than Mr. Le Gallienne has been wont to write. The account of a leisurely journey through a lovely region, lightened with comment upon architecture, antiquities, and books suggested by each stopping-place, must give many people pleasure. A very well-selected and original itinerary this was, too; a ramble among seldom-named villages, once loved of good authors. Selborne, of course, is sacred to Gilbert White; Liphook charmed Pater and Cobbett; and (in spite of Shakspere) Stratford keeps a place for Washington Irving. At Winchester lie Izaak Walton and Jane Austen; at Hursley, John Keble; at Salisbury, Richard Jefferies, and here lived Massinger, Addison, and Fielding. Here, too, was first printed the 'Vicar of Wakefield'; and near by is Sarum, for whose use was instituted the famous "Ordinal of Offices," that became the English prayer-book. A piety like that which led our traveller to these places, took him to Winterslow because it had been the home of Hazlitt; to Bemerton for the sake of George Herbert; to Lechlade because Shelley once went boating thither; and to Kelmscott and Market-Drayton in remembrance of William Morris and Lord De Tabley. In his selection of natural scenery, Mr. Le Gallienne is equally particular, preferring the Cotswolds, the Rivers Test and Itchen, the Roman remains at Cirencester, and the Druidical ruins of Avebury to places more celebrated or grandiose. In short, the book is, for the most part, pleasant, entertaining, and even instructive, if imparting to the reader a desire to make this journey and to read again in those authors be any test.

Mr. Le Gallienne seems torn between a natural good sense and an acquired preciosity. For example, he heartily admires Irving's simplicity, and quotes at length from the 'Sketch-Book'; but adds, apologetically, "I suppose M. Huysmans and such virtuosi of the one inevitable word would think small beer of such writing." He quotes from Walton's 'Lives' a beautiful anecdote of Herbert, and is capable, himself, of writing as kindly and fitting an allusion as this to Richard Cromwell, "one of the meekest" and unhappiest of men:

> "Above Richard Cromwell's vault is a large memorial tablet erected by an aged spinster daughter, and crowded with many names. As one reads these names, one grows to forget a public incompetency, in the pathos of a succession of domestic sorrows—the pathos of frustrated fatherhood; for most of these names belong to tiny children, some barely a year old, some mere breaths that came and went without a name. One can say no more of Richard, Protector, after this—one can only remember the little coffins."

But our author is not always so well balanced. Sarah Bernhardt's play-acting at Stratford is not a curious and incongruous thing to him, but a subject for rhapsody. "Of a sudden the wonder was enacting. She had bloomed in the doorway, half orchid and half queen; . . . once long ago men and women had watched Cleopatra like that." Mr. Le Gallienne would do well to forsake Huysmans for Irving altogether. He is a saner model and withal much more English.

A History of Sanskrit Literature. By Arthur A. Macdonell, M.A., Ph.D. D. Appleton & Co. 1900. [Literatures of the World, edited by Edmund Gosse.]

There are three standard histories of Sanskrit literature—Müller's, which is out of print and limited to one period; Weber's, which is caviare to the vulgar; and L. von Schröder's, which is an excellent amplification of Weber's, but is not translated into English. To these more or less incomplete and inaccessible works is now added, by a competent hand, an excellent condensed sketch of the whole of Sanskrit literature. Professor Macdonell is already favorably known through his 'Vedic Mythology' in Bühler's "Grundriss," and the present volume shows the same careful and conservative attitude which was exhibited in his earlier book.

After a general sketch of the language and its dialects, including a paragraph on Vedic accent, the author takes up first the religious literature of the Vedic hymns, with a supplementary chapter on the *Realien* of the period, and then continues down the whole course of the literature, with occasional translations in illustration of the various periods, completing the work with a brief account of the relation between India and the West after Alexander's conquest. Owing to the nature of the literature, much of the first part of the volume is almost identical with the matter furnished by previous histories of Indian religions, but this was unavoidable. In regard to recent attempts to overthrow existing estimates of the dates of the Vedic and epic literature, the chief bones of contention to Sanskrit scholars to-day, Professor Macdonell's view is extremely reasonable. He rightly says that the whole argument of those who maintain with Professor Jacobi that the Vedic period goes back to 4000 B. C., is invalidated by the assumption of a doubtful interpretation, which forms the starting-point of the theory. As for Dahlmann's absurd calculation of the date of the epic, it is dismissed with the remark that it is irreconcilable with the data of the poem and is not likely to find support among scholars. It is refreshing to find a sober-minded thinker who is not carried off his feet by either of these seductive theories.

It would have been better, perhaps, had Professor Macdonell made plainer his own position in regard to the relative age of the two Sanskrit epics. It is scarcely possible to believe that the Râmâyana was composed without reference to a Sanskrit grammar, for one of the characters is said to speak Sanskrit like a priest, and another is praised because he had "studied grammar, and delivered a long speech without committing a single verbal mistake" (*apacabditam*). The dictum that the Râmâyana is the "earliest epic of importance conforming to the rules of poetics" (p. 303), should be modified by the addition that in this regard it stands exactly on a par with the latest parts of the Mahâbhârata. The remark on p. 307 that the Āryâ metre is not found in the Sanskrit epics, appears to have been simply copied from Jacobi, who has twice published the same incorrect statement. A minor lapse on the part of the author is discovered by combining two sentences on pp. 150 and 166, from which it would appear that riding on horseback was unknown in the Vedic age, but "was at least known to the Rigveda." Apart, however, from these slight faults, easily to be mended in the new edition which the book deserves, this volume is worthy of all praise. It handles with sufficient independence a long and intricate development, and affords a clear and concise survey of the whole of Sanskrit (including Vedic) literature. For the general public it gives the best available history of the subject.

The Theory and Practice of Taxation. By David Ames Wells. D. Appleton & Co. 1900.

The connection of Mr. Wells with the fiscal department of the Government of the United States was without a parallel in its history. Morris and Hamilton, it is true, did much to reëstablish our credit, and to develop some kind of a system of national taxation; but their labors were necessarily limited by considerations of expediency, and they were continually interfered with by Congress. Mr. Wells, on the other hand. not only had almost autocratic power given him, but he had also an opportunity to apply it in accordance with economic principles. The burden of taxation at the close of the civil war was enormous. Taxes had been added to taxes without any comprehension on the part of Congress of the results that would follow, and only the patriotic fervor of the country prevented the system from breaking down of its own weight. The situation at last became intolerable. Congress, which had been incompetent to construct a scientific fiscal systam, was equally incompetent to reform the abuses which it had established. It was, however, by this time aware of its incompetency, and was eager to comply with the popular demand for relief. President Lincoln, fortunately, was a judge of men, and, discerning Mr. Wells's capacity, he insisted on putting the whole matter of fiscal reform in his hands.

It is not improbable that the satisfactory results of intrusting the conduct of the war to the discretion of a single commander may have influenced Congress; at all events, it readily acceded to President Lincoln's proposal. For four years Mr. Wells practically had absolute control of the internal revenue of the Government. Within that period he entirely reconstructed the system. He brought order out of chaos. Hundreds of vexatious taxes were abolished, and the collection of those which remained was so simplified as to produce far more revenue with less inconvenience to the people. The principle that low taxes are more productive than high ones was never more strikingly exemplified. The story of the tax on distilled spirits will always remain one of the most remarkable chapters in the fiscal experience not only of this country, but of all countries. It has apparently passed out of the mind of the public and of legislators; but it is well that it should be set forth, as it is here, by the man who understood it most thoroughly. Even more forgotten is Mr. Wells's part in elaborating a scientific system of tariff revenue, which failed of adoption by a mere chance. It is impossible not to read of this lost opportunity without the most bitter regret. It has never returned, nor is there now any sign that it will return. But had the step then been taken, it is difficult to set any limits to the gain that our country would have made. The mere reduction of taxes would have been an inestimable relief to industry; but that would have been the least of the benefits. We should have been fairly started in the direction of free trade, and our Government might have been saved from falling into the hands of a sordid plutocracy.

These reflections may not seem altogether appropriate in a review of a treatise of this kind; but, in truth, Mr. Wells's book belongs to a past era. He died only yesterday, but the present generation of economists knew him not. He would have commanded the regard of Sully and Turgot, of Adam Smith and Peel and Gladstone; but the ideals which these men upheld are not the ideals of to-day. The distinction is not recognized, but it is of vast importance. To put it roughly, the ideal system of taxation, according to the school to which Mr. Wells belonged, is that under which the revenue of the State is obtained with the least possible expense and inconvenience to its subjects. In the opinion of the modern school, taxation should be so managed as to compel the subjects to contribute in proportion to their abilities. It is not improbable that even those who are aware of this distinction do not admit that it amounts to a repugnancy, and Mr. Wells himself does not explicitly announce it. Nevertheless, the two ideals are fundamentally opposed, and a large part of this book is taken up with arguments that prove the fundamental nature of the opposition. We may add that, in our opinion, these arguments overwhelmingly prove the case of Mr. Wells and his school, and demonstrate the hopelessness of the attempts to realize the ideals to which modern economists have committed themselves. Perhaps the best illustration of this point will be found in Mr. Wells's examination of the income tax, which he hated as heartily as did Mr. Gladstone. He shows that such a tax puts a handicap on the scrupulous, encourages corruption, is expensive to collect, and, if permanent, gradually diffuses itself over the community, so that those who pay it to the Government may more than reimburse themselves.

We cannot deny, however, that Mr. Wells carried the theory of the diffusion of taxes to an extreme. He was never willing to admit that a peculiar law existed in the case of the rent of land, and laid it down that landlords could compel their tenants to share the burden of taxes on land. It may be said that modern economists have disclosed the truth that the rent of land is but a species of an extensive genus. The economic world being full of monopoly or scarcity values, some writers would frame the system of taxation accordingly. But these unearned riches are as yet so imperfectly defined as not to be fit subjects of taxation, at least to anything like the same extent as the rent of land. With that exception, therefore, the principle of the diffusion of taxes is valid, and, as Mr. Wells shows, if that principle is admitted, all attempts to fasten taxes on the particular persons supposed to be best able to pay them will be futile. The expense of collecting such taxes is invariably very great, and thus the cost of trying to make the rich relieve the poor of their burdens may eventually come back, with the burdens, upon the shoulders of the class meant to be relieved.

Probably the most thoroughly elaborated portion of this work is that which relates to the taxation of intangible personal property, and to the phenomena of double taxation in general. Here Mr. Wells was on his own ground, and showed that singular mastery of fact which made his arguments so convincing. Indeed, it would be proper to extend to his work John Mill's explanation of Adam Smith's success—the combination of lucid statement of theory with apt illustration. The same qualities appear in his examination of taxes imposed for other purposes than that of revenue, and of the principles of taxation under a free government. These chapters breathe the free spirit of the best English traditions in recognizing the liberties of the subject as of supreme importance. No one has stated more emphatically than Mr. Wells the necessity of taxes, nor has any one so well shown how governments may so lay taxes as to derive abundant revenue therefrom; but no one has more clearly demonstrated the truth that a free people strengthens and enriches a government, while despotic methods corrupt and impoverish both rulers and subjects.

The chapters relating to taxation in early times in other countries are the least valuable, and their matter is to a considerable extent a mere compilation at second hand. But we are not inclined to dwell on this or on some other serious defects in the work, remembering the circumstances under which it was written. Mr. Wells was under sentence of death before he fairly began this treatise, and the sentence was executed before he completed it. He might have lived longer had he ceased working; but he preferred to die in harness. In view of this, we are inclined to dwell on the merits of his final labors rather than on their imperfections, and these merits are so great as to justify this course. No American citizen can fail to profit by the careful study of these pages; no citizen, we might almost say, is qualified for the proper discharge of his political duties without mastering the principles here expounded. We could wish that Mr. Wells had left a monument more worthy, in its finish, of his splendid abilities; but it is sufficient to remind his countrymen of the debt of gratitude which they owe to their only great minister of finance.

La Vie Américaine; L'Éducation et la Société. By Paul de Rousiers. Paris: Firmin-Didot & Cie.

Not every foreigner who writes a book on American life is as thorough in his efforts to know whereof he writes as M. de Rousiers. He makes no boast of his thoroughness, nor does he reveal his itinerary, but it would be hard to find any section of the country, or any important phase of American life, with which he has not brought himself into personal contact. He has seen the American prize-fight, much to his disgust. He thinks it too brutal for a Frenchman of the nineteenth century, though he tries to excuse it to a certain extent as a possible preparation for the rigorous life of the ranch or the farm. He has attended the fashionable balls of New York, "a marvellous exhibition of flowers, diamonds, and dress—an ostentatious display rather than a pleasure," and he has seen the village dance in the Far West, where tireless couples whirled to the discordant rhythm of a mediocre and equally tireless orchestra, dancing as if they had a set task to accomplish, and suggesting to him the reflection that the love for the dance which can sustain such an exercise must be a very ardent love indeed. He has studied the question of domestic service, and in the absence of a servant class content to remain in that position he finds the prime cause of many things which seem strange to the European visitor. In the West, for instance, he could never feel quite sure whether a young woman answering the ring of the door-bell was a servant, a nursery-maid, or the lady of the house, and was occasionally obliged to display a somewhat hypocritical gush of affection for the little one clinging at her side to atone for a wrong solution of the problem. In New York and Brooklyn, in turn, he finds in the same inability to get servants and keep them a leading cause of the prevalent "boarding-house habit," and, through that habit, of the tendency towards childless marriages. In the West, he concludes, people console themselves with the sacrifice of social formality to the lack of service, in the East they sacrifice the *home*. With the habit of *chewing*—tobacco everywhere in the mouths of men, gum in the mouths of girls and women—he is intensely disgusted, and small wonder.

The feature of American education which appeals to him most forcibly is the fact that the American child is educated with a view to a general adaptability to circumstances, not for a career definitely marked out in advance. The average American pupil in a school of given grade, he thinks, has a better knowledge of the subjects taught than the average French pupil of the same grade, not from better teaching, which he does not find to exist, but from the increased ardor and power of initiative in the American boy or girl. The freedom of the American girl, of course, forces itself upon his attention, but he feels perfectly assured that her habits are suited to her environment, and that the evils which would certainly result from a similar freedom in France are not found here. He takes pains to assure his countrymen that the conduct of a certain class of American girls in Paris is not representative of American society as a whole. The business success of the American people lies in their marvellous resiliency, their power of initiative, their active, creative personal energy. Throw the American business man down, and he is on his feet again at once, striving to regain his position, with no stigma because of his fall so long as he does not lie on his back and wait for some one else to help him up. In this energy and adaptability, M. de Rousiers finds the bond that makes of our population a single people, in spite of the numerous race elements which enter into its composition. If it is not this spirit that has led the foreigner to our shores, or if it does not take possession of him upon his arrival, at any rate it will make the real American of his children.

He probes the sores of our political machinery with unerring touch, but predicts a vorable outcome for the patient on the eral ground of his strong vitality and recuperative energy. The contrast between the decisiveness of character manifested in great crises by the last incumbent of the Presidential chair, and the halting inconsistency of its present occupant, has not escaped his notice, and he agrees with the reported opinion of our ex-Minister to Spain that the Cuban war could have been avoided and the independence of Cuba secured through peaceful diplomacy. He has penetrated the wickedness of Tammany to the bottom, and he is correctly apprised of the relation of the Platt-Tracy mayoralty episode to the present elevation of Tammany. Such minor movements as those of "Toledo Jones" and Hazen S. Pingree have not escaped him, though for some reason or other the Apostle of the Strenuous Life finds no place in his book. On the religious side, he finds an unusual respect for sacred things, a general acceptance of the Bible as in some way an inspired revelation, but a lack, after all, in active interest. He probably overestimates the proportion of men among us who have no church membership, but he does not make the mistake of concluding that those who are not members of some church are necessarily devoid of religious belief. A sincere Catholic himself, he naturally gives careful attention to the condition and prospects of American Catholicism. As between the reactionary party, led by men still under the sway of European habits of thought, and the branch of the Church which has caught the real American spirit, his sympathies are wholly with the latter. To it, in his opinion, belongs the future, and it is a future which has gifts of great worth in store, not merely for Americans, but for the people of the Old World in their own homes as well.

On the whole, M. de Rousiers has done a good service. If he has painted us "warts and all," he has done it with a kindly hand, and in a way sure to entertain and instruct any intelligent reader, whether French or American. It will be remembered that he has already published a volume on American 'Ranches, Farms, and Factories.' We know not how much demand might be found for his work in translation, but there is no risk in the assertion that its wide reading in this country would be of great value.

Sir Archibald Campbell of Inverneill, sometime Prisoner of War in the Jail at Concord, Massachusetts. By Charles H. Walcott. Illustrated. Boston. 8vo, pp. 62.

Mr. Walcott has had the good fortune to strike an episode in the history of the Revolutionary War not before exploited, and the ability to make an interesting account of a deserving officer. It seems that in April, 1776, the Seventy-first Regiment, Highlanders, embarked at Greenock for Boston, for service as needed. Simon Fraser, M.P., was Colonel, with Sir William Erskine and Archibald Campbell as Lieutenant-Colonels, and Robert Menzies, Macdonnell, and Lamont as Majors. The regiment was loaded on seven transports, lightly armed, and arrived at Boston June 16. With providential stupidity, the English, who had evacuated the town on March 17, had neglected to notify the home authorities or to leave any cruisers off the port. The Americans were more judicious, and had four privateers ready, who skirmished with the convoy. Reinforced by the brig *Defence*, of sixteen carriage-guns and twenty swivels, and a schooner of eight carriage-guns and twelve swivels, the provincials attacked the little English fleet, which twice ran aground; and, having been fired upon from a land battery at Nantasket Roads, the commander concluded that "there could hardly be any friends of ours at Boston." After a sharp combat of an hour and a half, the British had expended every shot they had for their cannon, and surrendered to the jubilant Americans on honorable terms.

This success was something of an elephant for the Massachusetts authorities, unprovided with proper places for the confinement of prisoners not criminals. Lieut.-Col. Campbell and seven other officers were sent to Reading, and the rank and file scattered in squads. In December, 1776, the capture of our Gen. Charles Lee by the British made a great change in matters. The refusal to exchange him, and the threat to send him to England for trial as a rebel, led to orders to retaliate upon Lieut.-Col. Campbell. He was accordingly sent to the jail in Concord for safe keeping, and treated as a criminal instead of a prisoner of war. His manly protests are here printed, directed to the State authorities and to Gen. Washington. The latter stands out in fine colors, but, as he states, he could not overrule the orders of a civilian Congress. The treatment of the prisoner was only slowly alleviated, and, though never really cruel, is a proof of the incapacity of a committee of Congress to deal with military affairs. While Lee, a captive at New York, was handsomely treated by his British captors, allowed whatever diet he chose, with friends to dine with him daily, Col. Campbell was only allowed the freedom of the jailor's house. At last, in May, 1778, Campbell was exchanged for Col. Ethan Allen, after two years' captivity.

Archibald (Lieut.-Col.) Campbell, second son of James Campbell of Inverneill, Chamberlain of Argyll, and Hereditary Usher of the White Rod for Scotland, was born August 21, 1739, and in 1776 had already seen considerable service in the corps of engineers, serving in Bengal in 1767. As soon as he was released from captivity, he was put in command at New York of a force of some 3,500 men, including his Seventy-first Highlanders, and dispatched against Savannah. He arrived there December 23, and, without waiting for the arrival of his nominal chief, Gen. Prevost, Campbell proceeded to capture the colony. Returning home on leave of absence, in June, 1779, he married Amelia, daughter of Allan Ramsay, the painter, and granddaughter of the poet. In December, 1779, he was made Lieutenant-Governor of Jamaica, with the rank of Brigadier-General, and in 1782 he became Governor of the island and Major-General. In March, 1785, Campbell was made Governor of Madras, and a K.B. In 1786 he was made Commander-in-Chief of the forces on the coast of Coromandel, but was not able to satisfy the demands of his nominal employers, the East India Company. In 1789 he resigned and sailed for home with impaired health. He was again elected to Parliament, but died March 31, 1791, aged fifty-one years, leaving a widow but no children. His brothers erected a monument to his memory in the Poets' Corner of Westminster Abbey, and two portraits, presumably by Ramsay, engraved for this memoir, have preserved his likeness. The family estate seems to have passed to his nephew, Capt. James

Campbell, and is now possessed by Lieut.-Col. Duncan Campbell.

We have felt impelled to make this brief sketch of a gallant foe as a sort of reparation for the unfair treatment which he received in the flesh. It is just to say that what befell him was mainly due to the ignorance of our ancestors as to the proper treatment of prisoners of war, and not to intentional malice. This interesting little essay is additionally embellished with an interesting portrait of Lady Campbell, a view of Inverneill House, and a drawing of the old jail at Concord, said to be the work of Col. Campbell.

Theory of Differential Equations. By Andrew Russell Forsyth. Cambridge: At the University Press; New York: Macmillan. 8vo. Vol. I., 1890, pp. 340; Vol. II., 1900, pp. 344; Vol. III., 1900, pp. 391.

The previous 'Treatise on Differential Equations' (Macmillan, 1885) of Prof. Forsyth, now Cayley's successor in Cambridge, presented the subject in an elementary way, suitable for a beginner. The present work is addressed to such as have at least a thorough elementary knowledge of the subject, and invites the attention of all who have penetrated more deeply into it. It does not, perhaps, display as much high talent as Émile Picard's treatise (which, of course, is of a different nature); but the thoroughness with which the substance of the memoirs has been worked over, quietly improved in many places, and set before the reader in a compact and easily read form, can be known only to those who will put themselves to the trouble of making the comparisons. The reader is everywhere referred to the greater memoirs, as well as to any other presentations of the several branches of the subject that may have been found specially luminous by Prof. Forsyth. Lesser papers, even in cases where they add something material, are, for the most part, passed by. For example, at the end of chapter ii. of volume ii., which is devoted to Cauchy's existence-theorem, there are fifteen references to thirteen different memoirs and treatises. Among these, of course, figures the classical work of Madame Kovalevsky; but the connected investigations of Delassus are not mentioned, nor does his name appear in the index. It is true that these, like Madame Kovalevsky's, relate mainly to partial differential equations, and are thus, in a formal view, foreign to the subject in hand. But then, would not the whole question of the existence of integrals have been advantageously set forth, at least in its outlines, connectedly?

This brings us to remark that the arrangement of Prof. Forsyth's matter seems to have been determined by the circumstance that such and such a part was ready for publication. Certainly, it was most desirable that as soon as any division of the work was ready it should be set before the mathematical world at once; nor do we intend to imply that the selection of parts to be prepared was a random one. Volume i. treats of total equations and mainly of Pfaff's problem; volumes ii. and iii., of ordinary equations not linear. Now, on the principle of treating the general before the special, it was certainly desirable to place Pfaffians thus early; and with them a great part of the subject of partial differential equations. But a considerable part of the latter subject remains, and unless Prof. Forsyth returns to it, will remain, unconsidered. There is also room for doubt as to whether it was expedient to postpone ordinary linear equations to equations not linear. However, no arrangement could have been adopted that would clean up the whole matter to be disposed of at one systematic sweep. There must inevitably be considerable odds and ends requiring a subsequent gleaning. The author proposes to treat ordinary linear equations in "an additional volume." A complete collection of all that has been contributed to that subject would make a library exceeding the entire impedimenta of many an able mathematician; and as to its being compressed into one volume, a doubt may be permitted. So, considering how much else remains over, we may hope that two, if not three, volumes are yet to be added to this admirable and beneficent work.

This is not the place to consider it more in detail; but seeing that the doctrine of differential equations is one of the most practical of the branches of mathematics, which every young man who aspires to apply exact principles to the affairs of life more than his predecessors have done, has to know at least as well as he knows how to spell, we will point out to beginners the advantage there now is in seeking their first introduction to this discipline at the hands of Forsyth's 'Treatise,' since his 'Theory' is now at hand to supplement it in directions in which they may desire to push their studies further. A better practical mastery of differential equations can be attained by beginning with Forsyth's 'Treatise,' followed by his 'Theory,' than by the aid of Jordan, Königsberger, or any other extant guide. It is a lucid and delightful work, and has the advantage of offering a careful selection of those exercises for the student which are much more needed here than in other equally advanced branches of mathematics, for the reason that there is no perfect calculus enabling one to tilt at a differential equation like a knight in armor. Strategy and experience are nowhere more demanded.

Thomas Hariot, the Mathematician, the Philosopher, and the Scholar, developed chiefly from dormant materials, with notices of his Associates, including Biographical and Bibliographical Disquisitions upon the materials of the History of 'Ould Virginia.' By Henry Stevens of Vermont, F.S.A., Student of American History, Bibliographer, and Lover of Books. London: Privately printed. 1900. [Edition of 195 copies.]

In 1877, the late Henry Stevens, to whose zeal and liberality students of American history owe so large a debt, projected an association to be called the Hercules Club, whose object was to discover and print or reprint, with conscientious editing, rare manuscripts, books, and pamphlets of importance to Anglo-American history. The name chosen is explained by the declaration in the prospectus of their intention "to scour the plain and endeavor to rid it of some of the many literary, historical, chronological, geographical, and other monstrous errors, hydras, and public nuisances that infest it." Mr. Stevens, as Secretary, undertook to edit and carry through the press ten works originally published in the years 1588-1628. The other members of the association were less energetic, and Mr. Stevens was left to do the work virtually single-handed.

The book which he first undertook was the oldest on the list, Thomas Hariot's 'Brief and True Report of the New-Found Land of Virginia,' printed in London in 1588, of which but seven copies are known to exist. The investigations which his editorial care involved disclosed so much new material relating to Hariot and to Raleigh that Mr. Stevens determined to embody this in a separate volume. On the death of Mr. Stevens in 1886, his son and literary executor, Mr. Henry N. Stevens, took up the task of completing his father's unfinished work. He found that Hariot's 'Virginia' and the Life of Hariot were practically complete, most of the sheets having been printed off, and the rest of the matter still standing in type at the Chiswick Press, where it had slept for fourteen years. The edition was necessarily a limited one, and this it is that now sees the light in exquisite miniature quartos which are gems of bookmaking, and a tasteful memorial of a man whose memory is endeared to two hemispheres.

For the incidents of the life of Virginia's earliest historian, as also for a carefully sifted account of Raleigh's efforts at colonization, we must refer our readers to the book itself. Hariot was an intimate friend of Raleigh almost from his boyhood, was a member of his first Virginia expedition of 1585, and, after his return, was his almost inseparable companion. During Raleigh's long imprisonment in the Tower, Hariot was his means for communicating with the outside world. With another state prisoner Hariot was also in confidential relations—the great and unfortunate Earl of Northumberland, who placed his library and astronomical instruments at his disposal. For Hariot was not merely a literary man; he was one of the most eminent mathematicians and astronomers of his age. He was, according to Mr. Stevens, "as great an astronomer as Galileo." Sir William Lower, the astronomer, in a letter to Hariot dated June 21, 1610 (here cited in full), begs the latter to send him more of these "cylinders [telescopes]"; and relates how "with my cylinder last winter I often observed" certain stars in Orion, and also "the seven stars in Taurus," which, "through my cylinder, I saw plainlie and far asunder." In another letter of February 6, 1610-11, Lower acknowledges the receipt of another "perspective cylinder," and mentions his observations with it. These letters make it plain that at least as early as 1609 Hariot was making telescopes, using them for astronomical observations, and furnishing them to others. The books date the first astronomical use of the telescope by Galileo in 1610, so that Mr. Stevens's claim of priority for Hariot seems to be justified. Hariot was one of Keppler's correspondents. Furthermore, he discovered improved methods in algebra, and was recognized as an equal by the greatest mathematicians of the time. He died in 1621, and was buried in the heart of London, in the little churchyard of St. Christopher, now surrounded by the Bank of England.

While a book-collector may rejoice in being the fortunate possessor of one of the copies of this delightful reprint, the present reviewer must express a regret that a work of such interest cannot have a wider circulation.

McKinley. He did expose the wickedness and folly of a policy of bloodshed and conquest in the Philippines; but he never went so far as to say that he would not vote to keep in power the Administration which maintained this policy. He showed with impressive eloquence that this policy was ruinous to our country, hostile to our traditions, and fatal to the cause of popular government. In converting our republic into an empire, it extinguished the last hope of mankind, and, according to his description, nothing more unprincipled, more wantonly wicked, could be imagined. But he now blandly denominates this policy a "mistake," and fancies that the Republicans show signs of being sorry for it. When he talks of the Democrats, he is not so tender in his choice of words. He does not call the rebellion of the Southern States a mistake, but a crime; slavery was a crime, and the Democrats have attempted the crime of debauching the currency. The ethical distinction between a mistake and a crime, according to Senator Hoar, depends on a party distinction. A wrong act done by one party is a mistake; done by the other party it is a crime. George Washington and the Convention over which he presided made a mistake, Senator Hoar says, when they provided for the return of fugitive slaves to their masters; but the Constitution should not therefore be denounced as "a covenant with death and an agreement with hell." But what view are fugitive slaves and struggling Filipinos to take of such "mistakes"? If they call them crimes, is their language "harsh"? And what fundamental "mistake" is going to make Senator Hoar a come-outer from his party, if denying the right of man to self-government in the Philippines will not?

The delay in procuring the extradition of Neely, the postal official accused of embezzlement in Cuba, shows the difficulty of the position which the United States Government occupies in that island. Congress explicitly declared that the people of Cuba were free and independent, and in the treaty with Spain great care was taken that our sovereignty should not be asserted. At the same time the sovereignty of Spain was totally extinguished. Since sovereignty resides neither in Spain nor in the United States, it would seem to reside in the people of Cuba. But this people has no organized government, and, without such government, sovereignty cannot be recognized at law. It must be embodied in certain human beings before the law can operate. The Administration is fond of dwelling on the appalling consequences of not asserting our own sovereignty in the Philippines, after that of Spain was overthrown. It contends that it was absolutely necessary, in order to prevent anarchy, that sovereignty should be assumed by us, although every one knows that the Filipinos had an organized government, while the Cubans had not. Whether these consequences are appalling or not, we are face to face with them in Cuba. We cannot assert our own sovereignty there, and we will not let the Cubans assert theirs. Under such circumstances, to undertake the extradition of criminals to Cuba is about as difficult as it would be to deliver them to a tribe of Eskimos in Alaska. There is, of course, no treaty with Cuba providing for extradition, nor any Cuban officer to whom delivery can be made. Congress has passed an act, undeniably of an *ex-post-facto* character, providing for extradition; but unless some organized body independent of our Government is prepared to accept that act, it amounts simply to dealing with ourselves. We may call it extradition, but it is evidently nothing but the transfer of an accused person from the jurisdiction of one department of our Government to that of another.

Judge Lacombe's decision on one feature of this case does not go far to clear it up. He held merely that the presentation of an indictment was not sufficient evidence to justify extradition, and his further remarks seem to be *obiter dicta*. He finds it impossible to think that our occupation of Cuba, constitutional in its inception, "may not continue to secure the lives and property of American citizens within that territory." This may be conceded, but it is irrelevant. We cannot get away from the fact that our occupation of Cuba is a military occupation; that whatever government exists there is the creation of our military power; and that the so-called Cuban judges are merely subordinates of our military officers, administering what are called laws, but what are essentially military orders. The system is a system of martial law. Had Neely been caught in Cuba, the Cuban courts might have tried him, and we need not contend now that American citizens cannot be tried by court-martial when they offend against military regulations in a locality where such regulations are supreme. But the question here is whether an American citizen can be seized in this country, where there is no claim that martial law prevails, and sent to a province where our civil laws do not apply, to be tried there by what is practically a military commission. The Milligan case is considered not to be in point by Judge Lacombe, but the principle there established cannot be easily avoided. We do not regard Mr. Neely as the brightest flower of American civilization; but his personality is no reason for abandoning the constitutional safeguards of liberty. It may, however, furnish a good reason for abandoning an inconsistent and illogical position in Cuba; and if his proceedings lead to that result, we shall regard him as an illustration of the maxim that private vices may be public benefits.

Although the Presidential campaign thus far has been rather unenlivening, there are a few indications here and there that the great quadrennial convulsion is at hand. No such pathetic scene, for example, would have been possible at any other time as the reappearance, a few days ago, of the present Commissioner-General of Immigration at the weekly meeting of District Assembly 49 of the Knights of Labor. Mr. Powderly's return to the quarters from which he was forced to beat a somewhat precipitate and undignified retreat, a few years ago, seems to have been in the nature of a penitential pilgrimage. We have a touching picture of him in the act of kissing the charter of the sacred order; and we are informed that, with tears in his eyes, he addressed his former associates, expressing his regrets that he had ever left the organization, and his wishes that he were a member in good standing today. Whether these regrets were shared by his hearers, is not revealed; but it is hardly likely that the present generation of Knights, few of whom have been provided with Government jobs, regarded the eminent backslider with appropriate seriousness. They may have been uncharitable enough to recall that the present Commissioner-General has been credited with entering into a contract with Mr. Hanna to deliver the labor vote to the Republican party for value received. It is true that the Knights of Labor is an insignificant organization now; that it is sadly reduced in numbers, torn with dissensions, and of little influence among workingmen. It is also true that Mr. Powderly was more or less forcibly ejected from its counsels, a number of years ago; and that his unsolicited appearance with the olive branch now may seem slightly indelicate. Still, when the well-salaried places of the Commissioner-General and a host of relatives and personal retainers are at stake, he cannot afford to be over nice; and if a little snivelling will suffice to turn a few votes into the proper channel, why should Mr. Powderly, of all men in the world, hesitate to do his duty?

Bryan's chances do not appear so good anywhere else in the Central West as in Indiana. That State has repeatedly gone Democratic when large Republican majorities were given by its neighbors, and it would not be strange if the same thing should happen again this year. At the same time it would seem only natural that the same influences which operate in Indiana should be felt also in other States in that section. Indeed, there are already signs that Bryan will run decidedly better in Illinois this year than in 1896. A certain proportion of the Gold Democrats are ready to accept him now, though apparently not so large a percentage as in Indiana. But what worries the Republican managers much more is the attitude of the workingmen. The labor troubles in Chicago are not yet settled, and there is a large labor vote which is by no means satisfied with "McKinley prosperity." The chief reliance of the Republicans is upon the German vote. They admit that this element is much disaffected over the Philippine policy of the Administration, but they hope that the free-coinage plank in the Kansas City platform will drive it back to the Republican party.

Republican organs in the East have been a good deal surprised by the statement of Chairman Dick of the Ohio Republican State Committee, that the President's own State must be regarded as doubtful this year, and that the party had better also not regard Indiana, Illinois, Michigan, Wisconsin, and Minnesota as sure States. The majorities for McKinley four years ago were so large in each of these six States, except Indiana, that most Eastern people have considered them certain to go Republican again in 1900, even if the majorities should not be so great. There is plenty of evidence that Bryan has a better standing in that part of the country now than he had at the same stage of the canvass in 1896. In Indiana, for example, a considerable number of the Gold Democrats of four years ago have already declared for Bryan, among them a bank President and the President of the Board of Health of Indianapolis, and two judges in Spencer and Logansport; and a well-informed Indianapolis citizen is of opinion that the bulk of this vote throughout the State will go that way. "The financial plank in the Kansas City platform was a tough dose," says this authority, "but many make themselves believe that it won't amount to anything." Our informant thinks that "the union of all the Bryan elements, Democrats, Populists, free-silver cranks, and 'scalawags' of all kinds, is very complete in Indiana," and that this union now seems likely to poll more votes than McKinley, towards whom a large number of Republicans are indifferent.

That the Republicans are in danger of losing the next House of Representatives is frankly admitted by Chairman Babcock of their Congressional Committee. The Opposition start with the great advantage of about 120 seats from Southern States in which the Republicans make no fight, and thus have two-thirds of a majority from districts which are practically uncontested. They need to pick up only sixty more from the rest of the country in order to control the body. They came so near this in 1898 that changes in eight close districts would have left the Republicans in a minority. In one respect the dominant party is worse off now than it was then. Two years ago the Gold-Standard Act had not been passed, and many Gold Democrats were inclined to support Republican candidates for Congress in order to secure its enactment, while now some of them feel that the assured sound-money majority in the Senate during the next Congress renders the financial attitude of the House less important. On the other hand, the fuller vote which a Presidential contest always brings out is likely to help the Republicans more than the Democrats as a rule.

Were all legally qualified voters to vote in North Carolina, and were their votes to be counted, it is probable that the Republicans would have a majority, and that the amendment to the Constitution which disfranchises the negroes would be rejected. This amendment, it is computed, will deprive 80,000 to 100,000 negroes of the right of suffrage. They certainly will not vote for such an amendment as this, and the whites seem to be determined that they shall not vote against it. Under forms of law, but really under duress, the negroes will thus allow themselves to be disfranchised. Gov. Russell advises the negroes to submit, lest worse befall them; and as large gangs of white men, clad in red shirts and fully armed, are parading up and down the State, and crying "white supremacy," no other course is practicable. Had not the Republican party abandoned its principles regarding the rights of man, such proceedings in the Southern States would make the North "solid"; but any protest it might make would now be answered out of its own mouth.

The Appellate Division of the New York Supreme Court has rendered an important decision in support of the right of labor unions to prevent the employment of laborers to whom they object. The controversy arose between two associations of steam-fitters—the National and the Enterprise. Members of the Enterprise Union went to several buildings on which members of the National Union were working, and procured their discharge by threatening their employers. They told the employers that unless the National men were discharged, not only the Enterprise men, but also the members of other unions allied with them, would quit work. As the employers were yielding to this threat, the National Union obtained an injunction restraining them, which the Appellate Court has now dissolved. The Court observes, in the first place, that every workman has the right to say for whom and with whom he will work. This right is nothing but the constitutional right of free contract. It implies that the right may be exercised from any motive; and, the Court adds, the employer has an equally absolute right to say whom he will employ. It follows from this, that a man may refuse to work for the purpose of inducing his employer to discharge an objectionable fellow-workman. The purpose is not illegal, nor is the method. The Court then proceeds to say that if the individual workman has this right, "he does not lose it when acting with others, clothed with an equal right, so that employers may continue to say they will not employ persons who are members of labor organizations, and laborers may continue to say they will not work for employers who engage any but members of labor organizations." This decision entirely sweeps away whatever vestiges of the old conspiracy legislation, intended to prevent combinations to raise wages, were to be found in this State, and establishes the principle that an association of laborers may do whatever an individual laborer may. It is, of course, entirely inconsistent with the law against combinations in restraint of trade, known as the Anti-Trust Law, which makes it a crime to enter into any agreement that may prevent competition.

The experiment of levying special taxes on department stores is to be tried in Prussia. After the 1st of January, 1901, all merchandise is divided into four classes, and every concern which sells things belonging to more than one of these groups is to pay a graduated tax, provided its sales amount to more than $95,000 per annum, or 400,000 marks, From 400,000 to 450,000 marks, the tax is 4,000 marks. On sales between 950,000 and 1,000,000 marks, the tax is 18,000 marks, and for every additional 100,000 marks the tax is 2,000 marks. Of course this legislation is in the interest of the small shopkeepers, whose customers have found their wants better supplied by the large establishments. Some very amusing suggestions are made by the Minister of Finance in presenting this specimen of protectionism to the favored classes. He tells them that it will depend on them whether the law shall fulfil the benevolent purpose of the State. They will be expected to organize, "with self-helpful motives," such associations as will increase their power to compete with the department stores. The middlemen, "through energetic, intelligent self-help," must now, by means of cheap purchases and profitable sales, secure themselves against the competition of large capital. It does not seem to occur to the Finance Minister that to relieve one class of tradesmen of the competition of another is not to stimulate the former class to rely on their own exertions, but leads them to look for help to the Government. We have tried the experiment for a good many years in this country; but the protected interests always claim that their competitors must be taxed a little more before self-help can be put in effective operation.

REASONS FOR A THIRD TICKET.

Whether a third Presidential ticket will be named by the Gold Democrats or the Anti-Imperialists, or by both in unison, we do not know; but that one should be named we are firmly convinced. The reason lies in the character both of the existing candidates and of the platforms upon which they stand; in the intolerable dilemma confronting thousands of citizens who refuse to make a choice between confessed evils, and who will not vote at all unless a man and principles are offered them; in the need which exists of raising a standard to which honest men can resort at present, and by which they will be prepared to stand in the future.

An extraordinary failure sharply to join issue marks the attitude of the two parties. The crucial thing is silver, cry Republicans in the East; it is not, retort the Democrats, it is Imperialism and Trusts. The issue is 16 to 1, assert Democratic orators in the mining States; not at all, rejoin Republican speakers, it is Expansion, and the flag a business investment. Each party is evidently willing to become all things to all men if by all means it may carry the election. The Republicans proclaim sound principles of finance, but an unsound theory of government. The Democrats assert the historic doctrine of republican government, but would ruin the people who live under it. Neither platform is the true logical contradictory of the other. The poison of one has no separate antidote in the other. Both are deeply unsatisfactory to large numbers of our clearest heads and best lives. If such people are to have a set of political principles which they can support without qualms or quailing, they must draft it for themselves.

At the coming election probably more than two millions and a half of men will cast their first votes for President. These votes will be almost one-sixth of the total number; and as a change of one-twentieth of the votes cast is generally more than sufficient to change the result of a general election, the question how the young voters will exercise their franchise is one of deep interest to the political managers. No very marked change is likely to take place in the habits and prejudices of the older citizens. They will vote in the main for the candidate of the party with which they have been accustomed to act; how their sons will vote is not easily foretold. But how they ought to vote, they will be told by hundreds of advisers, and one of the maxims which the worldly-wise will try to recommend to them is, "Don't throw away your vote." Whoever manifests a disposition to be politically independent, to disregard party lines and regular nominations, is sure to be warned by "prac*tical" men that he is going to waste his strength and his influence if he* votes for any one who is not likely to be elected.

The principle of this advice is simple enough. There are two candidates, one of whom is sure to be elected, and a vote for either of them will contribute to his election. A vote for any other candidate cannot elect him; and as it would have been cast for one of the possibly successful candidates, had it not been cast for one whose success is hopeless, it is in effect a vote against him whose cause it might have aided. The next President, it is now said, will be either McKinley or Bryan; and the only sensible course for the independent voter to follow is to make up his mind which of these two he prefers and to support him. Many of those who urge this course admit that it implies a choice of evils. They confess that they like neither the actual policy of the Republican party, nor the probable policy of the Democratic party; but they insist that as one party or the other will direct the affairs of the country, the good citizen should decide which party will on the whole direct these affairs with the greatest wisdom, or the least folly, and support the candidate presented by that party.

Plausible as this reasoning sounds, it involves a number of fallacies. In the first place, there are many States in which the result of the election is practically as certain as the rising of the sun. The number of independent voters is so small as to be incapable of affecting the result. Every Democrat who casts a vote for Bryan in most of the New England States throws it away; every Republican who casts a vote for McKinley in most of the Southern States does the same. When this is pointed out to those who protest against the folly of throwing away votes, they shift their ground. Ah! they say, you must consider the moral effect. That is exactly what we propose to consider, and it involves the examination of several other contingencies besides the personality of the next President. The moral effect on whom, and on what? Why, if McKinley's vote falls off in New England, it will have a discouraging effect on the Republican party. It may not prevent his election, but it will make the party leaders feel that their tenure of power is uncertain. The reply to this is, that if it is true, it is altogether to be desired. If these leaders believe that they are losing the favor of the people, they may be induced to mend their ways; and perhaps they can be induced by no other consideration.

In the States where the result is certain, therefore, the independent voter may feel that he not only is not throwing away his vote, but is accomplishing all that he can hope to accomplish. He is helping to produce a moral effect which may be ultimately of the greatest advantage to the country. He is manifesting a spirit of discontent which may terrify his rulers and lead them to bring forth fruits meet for repentance. Under every form of government, rulers are on the watch for signs of popular feeling. Every despot trembles when there are indications that his subjects are no longer submissive, and every ruler in a free country will alter his policy when he is convinced that, if he does not, he will be turned out of office. In States of this class, it may be claimed that the most emphatic way to condemn the McKinley Administration is to vote for Bryan. Such a claim is entirely mistaken. Such votes would properly be regarded as indicating approval of Bryan's policy, the last thing which many independent voters could think of approving. To vote for a third candidate is to condemn both policies, and to warn both parties that, unless they are changed, a third party may be called into being that will respect protests against misgovernment.

Still, it may be contended, the case is different in the doubtful States. There the independent voter must admit that, in some States at least, if he votes for a third candidate, he is practically voting for Bryan. But the case is by no means so simple. Regarding it arithmetically, we may assume that the independents have been hitherto attached to the two parties in equal proportions. On this assumption, if they unite on a third candidate, their action would not affect the result, for both parties would lose equally. Regarding actual conditions, we might say that in Kentucky and Maryland and New Jersey the independent voters have been drawn chiefly from the Democratic party. If they do not vote for a third candidate, they may be expected to vote for Bryan. In Michigan and Wisconsin, the independent voters may be drawn from the Republicans, and if they do not have their own candidate they may vote for McKinley. With the new issues, these matters are highly speculative, and those who are proclaiming that a vote for a third candidate is a vote for Bryan are assuming too much. In one State such a vote may be in effect a vote for Bryan; but in another State it may be practically a vote for McKinley.

These arithmetical calculations are of deep interest to the party managers, but they are not decisive with the independent voter. The assertion that it is his duty to choose between two evils, he may meet with a flat negative. He does not admit that the country will be better off under Republican rule than under Democratic rule, because he does not feel sure that it will be. The Democrats may do temporary harm, while the Republicans may do permanent harm. Very few persons, in our judgment; very few intelligent persons, in their own judgment, know what is going to happen to the country. Our statesmen tell us that destiny has taken charge of our government, and that human wisdom and experience furnish us no guidance. There are too many possibilities for certainty to exist. Judgments and opinions neutralize one another; and the number of persons who await the result of the election with a sort of hopeless indifference is surprisingly large. If McKinley is elected, they say, it may deliver us from Bryan and his wearisome policy of repudiation; but if Bryan is elected, the country may be rescued from Imperialism and Militarism. Persons who feel in this way are likely to think their votes may prove to be thrown away, if cast for either of these candidates.

We have touched on this subject only superficially; for the conscientious voter looks more than four years ahead. Worse than the election of McKinley, worse than that of Bryan, would be the extinction of the spirit of independence. The hide-bound partisan, who looks only at the party emblem on his ballot, if we regard the matter rationally, is the man who throws away his vote. It represents no intelligent consideration, no conscientious resolution. We know that parties have been defeated and dissolved in the past, and that new parties have taken their place. These results are due to the course of those who were accused of throwing away their votes. They threw them away for Frémont; but four years later Lincoln was elected. Our material condition may be better if McKinley is elected; but what of the future? If the independent vote is very large this year, will it not render that future far more hopeful? And if it will, who will say that this vote is thrown away?

EUROPEAN AGGRESSIONS IN CHINA.

Whatever the causes of the terrible uprising in China, something has certainly happened for which the outside world was entirely unprepared. The Mantchu Government was supposed to be on its last legs, the military force of the empire contemptible, and national spirit non-existent. All at once the civilized world finds itself face to face with a people in arms. Yet Europe has only herself to thank for the present reaction against foreigners. Heedless of warnings not to push ahead too fast, the various Governments, each fearing to be left behind in the race, have demanded concession after concession, and, by virtue of the authority conferred by ships and guns, have established themselves on Chinese soil.

How much wiser would have been the policy laid down by our own State Department, it is now easy to see. If China had been left alone by the European family of colony-hunters, she would in due time have transformed herself. There was a liberal and enlightened party among her own rulers. The war with Japan had battered down the walls of Chinese exclusion, and opened the country to foreign trade and the introduction of machinery. The race has always been noted for its commercial activity; the Chinaman is one to whom the argument of material advantage appeals with peculiar force. Native laborers flocked into the factories at Shanghai as soon as they were built; foreign railroads and steamships, once introduced, found a large traffic waiting for them. Missionaries and travellers have for many years been penetrating inland, encountering on the whole less race hostility than might have been expected. Too swift change in the case of an old and fixed society is not desirable; it produces convulsions. But if the outsiders had had a little more patience and less greed, China would have found her own road.

The history of the relations between China and Europe during the present century shows a series of aggressions, provoked generally by the fatuousness, pride, and ignorance of Chinese officials, and pressed by powerful and selfish governments able to dictate their own terms. The record begins with the opium war, entered into by England in consequence of the efforts on the part of China to prevent the sale of the drug to her people. This war came to an end with the treaty of Nankin, in 1842, which ceded Hong Kong to England, opened five ports to foreign trade, and promised the payment of a money indemnity. In 1857 England again began hostilities, the immediate cause of the quarrel being the affair of a miserable little boat, Chinese-built, Chinese-manned, and Chinese-owned, but with a British captain and a purchased British register that had expired. After a one-sidedly destructive war, the treaty of Tientsin was concluded; China again paid an indemnity, opened fourteen additional ports, and surrendered to the British more territory at Hong Kong, besides repealing all edicts against Christianity. A period of quiet followed, during which missions and trade were making their peaceful conquests. Peace was broken by the French, who set out in 1882 to develop the colonial field offered by Indo-China, and, after an obstinate war, established their hold on Tonkin, as well as their older claim on Annam. A little later, in 1886, England was allowed to extend her authority over Upper Burma.

But in comparison with what has happened since the war with Japan, all that went before was as nothing. Russia had already advanced to the Pacific, and had for some years been suspected of a willingness to pick up a good naval station at the first chance. Japan, by the treaty of Shimonoseki, signed in 1895, was to receive the Liao-Tung peninsula, with Formosa and the Pescadores, and to be left a free hand in Korea, where China renounced all claim to suzerainty. But Russia had no desire to see a new rival intrenched on the mainland, and, backed by France and Germany, commanded the victor to withdraw from the peninsula in the interests of peace. China wished, if possible, to escape the payment of a heavy money indemnity, knowing that a large foreign debt would mean of necessity foreign interference in her affairs, and tried to offer to Japan as a substitute for Liao-Tung the concession of the Pekin-Tientsin Railway. But this suited Russia no better than the cession of territory. She insisted on a money compensation, and by this expedient drove Japan away and picked up the prize of victory. For China was now, in spite of herself, forced into Russia's open arms. The guarantee of the latter country enabled her to sell the bonds to pay off the war indemnity; and the *quid pro quo* was permission to run the Trans Siberian Railroad through Mantchuria, and to occupy the province for that purpose. This brought Russia to the Great Wall. France rewarded herself for her unsolicited services in the affair by a "rectification" of the frontier line of her colony in the South, and by railroad and commercial concessions. As for Germany, her bill was presented a little later—with interest.

The French advance stirred up England. The consequence was a new Anglo-Chinese convention, signed early in 1897. Another "rectification" took place, this time in Burma. But more important was the opening to foreign navigation of the Yang-tse-Kiang. This was a very valuable privilege, in view of the populous territory drained by this great river. And the advantage thus obtained by England was one in which every other nation could participate. Consequently Germany's action, in November of the same year, in seizing the Kiao-Chau peninsula, precipitated a storm. The dismemberment of China could bring only injury to English interests. Whatever fell to foreign Powers would be taken into a protective system, and English trade would be shut out. Under these circumstances England's policy quickly defined itself—to stand for the integrity of the Chinese empire and the open door. But could she carry out this policy? Germany, it is true, declared Kiao-Chau a free port, but she lost no time in establishing her "sphere of influence" in Shantung, one of the most populous provinces of China, within which she claimed an exclusive right to build railroads and open mines. And, lastly, Russia proceeded in March, 1898, to gather the remainder of her harvest by forcing from China the cession of Port Arthur and Talien-Wan, with permission to connect them with the so-called East Chinese Railway. The Trans-Siberian had found its coveted terminal. As a counter-step to this advance of Russia, England took Wei-Hai-Wei.

In this general game of grab, Italy had been left out. Last fall she tried to follow the popular example, and to make up for her earlier lack of enterprise by demanding Sanmun Bay, and a sphere of influence in the province of Chekiang.

But she came too late to the feast. The supposed corpse had begun to stir. The September revolution had taken place; the Dowager Empress had seized the reins of power. A new spirit began to manifest itself, and it soon became plain that this reactionary party was a party of national defence. The Boxer movement grew more serious, and the consuls began to press the Government to restore order. At last, the deluge. The strangest thing in the whole affair seems to have been the extraordinary inability of the foreign Ministers at Pekin to see what was coming. For once at least Western diplomacy was badly overmatched.

THE SOUTH AND THE PHILIPPINES.

A strange delusion has taken possession of the South, or at all events of the manufacturing portion of it, that the holding of the Philippine Islands will be good for trade, and especially for cotton-spinning. It is supposed by many that our cotton goods could not conveniently reach China without a place for storage and warehousing, and that the Philippines are in the very locality where such facilities are most needed. A glance at a terrestrial globe will disclose the fact that for the trade of northern China, whither the great bulk of our cotton exports go, the Philippines are at least fifteen hundred miles out of the way, and that we should not use them for warehousing purposes, even if we wanted intermediate storage, at all. As regards southern China, Hong Kong is much nearer the point of distribution, and is used by us for storage purposes now more or less. This is a British island adjacent to China, and is a free port. Not only can we store anything that we wish to store there, but we can enter our goods without the payment of customs duties. The most carefully devised and costly system of warehousing could furnish us nothing better than this. If we could call back all the money we paid to Spain for the Philippines, and all that we have spent in trying to conquer the Filipinos, we could buy nothing better with it than the facilities which Hong Kong offers us at all times at a small rental. But mankind in gross does not usually appreciate that which costs nothing. Individuals may, but nations seldom do so.

What is true of Hong Kong as a warehouse for southern China is true of Japan for northern, except that Japan is farther from the mainland. It is nearer, however, than the Philippines are. Japan, like Hong Kong, offers us all the warehousing facilities that we can use for a merely trifling rental.

But have we ever suffered in our trade with China for want of warehouses, or half-way houses? Certainly not. The lack of them was never thought of till reason was wanted to justify our holding the Philippines. The truth is, that the more warehousing, and half-way-housing, and transshipping a merchant does, the less are his profits. There is nothing that he dreads more. One of the main objects of an Isthmian canal is to avoid these things and to land the exported goods at the door of the consignee, avoiding all intermediate charges. If we had had the Philippine Islands all our lives, we should never have landed a bale of goods there intended for northern China—probably none for any country except the Philippines. Ah, says some would-be spinner of yarns for export, we shall at all events have the market of the Philippines themselves. Doubtful! Did you not read Bishop Potter's account of his visit to a cotton factory in Manila? Did you not hear him say that the bright Filipino boys and girls learned the art of cotton-spinning in one-quarter of the time required by the ordinary European? Who is to guarantee that they will not be sending cotton goods our way before we send any their way? Shall we prevent this by a tariff? Who will guarantee that a tariff levied by one part of the United States against another part will be held valid by the Supreme Court? Was not that question "Quigged" in the Philadelphia Convention the other day?

Like most popular delusions, this one is strong in proportion to its utter lack of support in reason or experience. It is like the curious notion that although our exports are increasmg by leaps and bounds, and our ship-yards are so full of work that we cannot place an order for an ocean steamer to be built inside of two years, we must pay subsidies out of the Treasury for the carrying of our goods to foreign markets. Yet the belief is quite prevalent in the South that we are to gain some great commercial advantage by holding the Philippines. The *modus operandi* is not pointed out, but the belief is all the stronger for the hazy atmosphere which surrounds it.

This state of facts leads up to the query: "Why, then, did the Southern politicians in the Kansas City Convention acquiesce in a platform which made the independence of the Philippines the paramount issue of the campaign?" There are two possible answers to this question. One is, that the manufacturing interest, which is infected with this craze, is outweighed by other Southern interests not so infected, and that these other interests are as much opposed to Expansion and Imperialism as the Kansas City platform makes out. The other is, that Anti-Imperialism was seized upon not as a matter of political conviction, but as a handy thing for a party issue, and that if Bryan should be elected, it would be kicked to the winds, and the Philippines retained nevertheless. The language of the platform makes the latter interpretation possible. It says: "We favor an immediate declaration of the nation's purpose to give the Filipinos, first, a stable form of government; second, independence; third, protection from outside interference," etc. These words, as we have previously shown, do not commit Mr. Bryan, or his party, to the granting of independence to the Filipinos within any definite period. Are we to suppose that these words were not chosen with the same care as the other parts of the platform? In a literary point of view, that work was extremely well done. If its framer had meant to say that independence should be granted to the Filipinos whenever they should have formed a government for themselves, he would have used words quite different from those which we find in the platform. If he meant to leave "stamping-ground" for Southern Imperialists, such as Senator Morgan of Alabama and Judge Snodgrass of Tennessee, who think that we ought to hold the Philippines for ever; if he intended to provide for delay and dispute, so that eventually the whole scheme of independence might be shelved, then the words chosen would be well adapted to that purpose. Whatever may have been the motives prompting the use of the phraseology employed, it has been whispered around with unpleasant frequency since the Convention adjourned that, in the event of Mr. Bryan's election, the question of surrendering the Philippines would not be necessarily determined thereby.

THE DISCONTENTED FARMER.

Those aggregations of figures which we call statistics are for the most part so untrustworthy as to compel us to resort to direct observation when we really wish to understand the condition of any class of our fellow-creatures. A really intelligent observer, if he is unbiassed and honest, can generally reach a much more satisfactory, and even scientific, conclusion in such matters than can be derived from census reports or other official publications. Being acquainted with these truths, Mr. C. B. Spahr, one of the editors of the *Outlook*, recently set forth on a journey for the purpose of satisfying himself, and the readers of his paper, concerning the welfare of various sorts and conditions of men. Mr. Spahr not only is an entertaining writer, but also possesses an alert and inquiring mind. His pictures of the life of divers classes of our citizens appear to be accurate representations of real conditions. They are of a nature to correct several misapprehensions, and to enable us to understand the sentiments and the demands of people with whom we are not all likely to come into personal contact. From many interesting types we select for examination a Minnesota farmer, as being, for political reasons, at present especially deserving of study.

This particular individual was an enthusiastic believer in Populism, a political creed of which we understand Mr. Spahr to be also a devotee, and wore "working clothes of clerical cut," while his face was "of exceptional purity of thought and warmth of sympathy." The wearer of this garb had for years ministered to a little Episcopal church, but supported his family—with considerable participation on their part, as appears in the sequel—by work on his farm. He was also President of a Farmers' Alliance. He owned a whole section, or 640 acres of land, for one-quarter of which he had paid about $500. The other three-quarters he had taken up under the Homestead Act, the Preëmption Act, and the Tree-planting Act, respectively. It is fair to infer that the cost of these quarter-sections had been about $700, bringing up the total cost of the farm to $1,200. We gather from statements elsewhere made that land in the neighborhood is now worth some $30 an acre, at which rate the farm in question would have a value of $19,000. As it maintained a herd of 100 cows and calves, and the average product of each cow was 350 pounds of butter a year, worth nearly twenty cents a pound, this valuation does not appear excessive.

It might seem "to thoughtful people in cities, who get their views from what they read," Mr. Spahr remarks, that such an advance in the price of land over what the people of the United States had sold it for was suggestive of an "unearned increment." No such suggestion is entertained for a moment by the owners of these farms—the "thoughtful people in the country, who get their views from what they see." The result of their meditations is, that the later settlers ought to be taxed for the benefits which they have received from the earlier ones. So far as they are Populists, they are particularly stern in their condemnation of such as have invested their capital in railroads with any expectation of deriving a profit from the growth of the country. They hold that the farmers are entitled not only to the increment in the value of their farms, but also to that in the value of such transportation facilities as have made the increment in the value of farming land possible. To many persons who have ventured their savings in the construction of Western railroads, such views do not seem to be altogether fair. They do not complain when a farm increases in value from $1,200 to $19,000; but they fail to see why the owners of such farms should denounce the extortions of the railroads with such fury, or get up a Populist party because of the gains of capital, which are far less than those of landowners.

But if this Populist clergyman does not afford a very striking illustration of poverty caused by corporate monopoly, so far as his land is concerned, how is it as regards his business? It seems that he had but one son, and hired but one man, except in the busy seasons. His method of "supporting his family by work on the farm" was explained by himself. "My wife and girls," he said, "until the older girls went away to school, took entire charge of the milking and butter-making." We are not informed of the proportion of calves to cows, but if we assume that half the herd was cows, we have a butter product of 17,500 pounds per annum, worth possibly $3,500 and certainly $3,000. The surplus calves from such cows as these ought to pay for all the hired help; and the other products from such a farm as this ought to bring in a very considerable sum. On the whole, we find it rather difficult to squeeze out a tear over the misery caused in this instance by the grinding tyranny of the money power. The advocacy of Populism by such a particularly thriving and prosperous victim of capitalistic oppression as this impresses us as a proceeding of much audacity. We feel now better able to understand the sympathetic greeting extended to Mr. Van Wyck and Mr. Croker, with their Ice-Trust holdings, at Kansas City. The thoughtful people in the country who get their views from what they see, and not from what they read, recognized those kindred spirits as hostile to inordinate gains—when not made by themselves.

For a brief moment we indulged a hope that this Populist clergyman might be an exceptional character, but Mr. Spahr rudely dispelled it by quoting the dividends paid by the creameries which the farmers have set up. During the intervals when they were not denouncing the Trusts for raising prices, or cursing the railroads for not lowering freights, or berating the merchants for making too great profits, they were setting up creameries without the investment of a dollar in cash, and making up the capital out of the profits of a single year's business. Fifty per cent., we are assured, is less rather than more than the usual dividend rate of these establishments, whose stock is entirely "water." This surpasses anything yet disclosed in the history of "Trusts" in this part of the country, and when we read that farmers used to sell their butter for twelve cents a pound, but now get twenty for it, we are quite overpowered by our emotions. We have heard stories of rural astuteness, and been warned against the guile of the country horse-dealer; but we had not suspected that the Western farmers were making quite such a good thing out of the public as they appear to be. The sufferings of the Populists are evidently not without mitigation. The "silver" lining of their cloud has its significance; and Populism has in it some of the wisdom of the serpent.

THE PASSION PLAY OF 1900.

OBERAMMERGAU, June 30, 1900.

Mr. W. T. Stead has done a genuine service to the English and American spectators of the Passion Play by his excellent, practically verbatim translation of the text. English and German are printed on opposite pages, and it is easy, even for those not absolutely familiar with the language of the fatherland, to follow the different characters in their clear and forceful speech, by the additional aid of his faithful interpretation.

The great tide of American tourists, however, had yesterday not turned fully toward the little village in the Bavarian Tyrol, although it comes nearer the flood with each performance. July and August will probably witness inundations. The crowds thronging the streets just before the play are undeniably cosmopolitan, but just now more German is heard than any other language. They have necessitated an extra performance not provided for in advance by any published schedule. The Christus of this season is no longer the famous Josef Mayer, who made in 1870-71, 1880, and 1890 so profound an impression; but his successor, young Anton Lang, a potter of Oberammergau, is filling the rôle with ever increasing success, his nervousness during the earlier performances in May having largely disappeared, and his face showing even greater adaptability to the part than the rugged countenance of Mayer. Lang's voice is gentle, his expression peculiarly spiritual. The former postman's daughter, Anna Flunger, makes a lovable Mary, also for the first time this season. She is but nineteen, and two or three days before the first performance her father died; her own sorrow thus lends additional pathos to her sweet face. Bertha Wolf, the Mary Magdalen, is a handsome blonde with superb hair, and an insistent vitality truly German. She is the daughter of an inn-keeper. Both she and the other Mary made a very strong impression, though the voice of neither can be said to be really fine. John and Judas are the only prominent characters taken this season by those who impersonated them during former years. It is whispered that Peter Rendl (John) would have been given the Christus part in 1900 if he could have produced the proper sort of beard. But his John is an almost perfect representation. Johann Zwink, too, the Judas, shows marked dramatic ability, his portrayal rising at times to a fervor and intensity entirely thrilling. And hardly less strong are Caiaphas, Pilate, and Herod, each newly represented this season; Herod by Rochus Lang, father of Anton.

Leaving Munich very early in the morning, we were able to reach the village several hours ahead of incoming crowds. From Murnau and the Staffel See, the scenery grows increasingly beautiful and inspiring. At length, mountains partly snow-covered slip into the horizon, steeper cliffs narrow toward the road, where wayside shrines become more frequent. A little town on a green plain beyond the swiftly flowing Ammer, surrounded by stupendous heights, Oberammergau lay in fitful shade and sunshine as we approached the new station. Villagers and peasants along the way had shown great interest in the incoming train, waving hands and kerchiefs in greeting, and smiling as we looked out. Long-haired, sweet-faced boys met us on the platform, to point the way to the town and carry the satchels.

A drive to Ettal and its wonderful church occupied a part of the afternoon, but I spent much time in calls upon the chief actors in the play and upon Father Schroeder, the parish priest. The gentle Mary was waiting upon the supper-table when I found her, for every house in the village is opened to guests during these important days; and John was selling his own exquisite wood-carvings. The house where Anton Lang lives with his father is, like so many mountain homes, under the same roof with the stable, and soft-eyed cows looked out wonderingly from a dark room next the one where I talked with the Christus. Father Schroeder has for years studied most carefully the effect of the play upon his parishioners. With only 1,400 inhabitants, not less than 685 of whom have parts in the performance, Oberammergau cannot fail to be profoundly affected. The very spirit of the region has been imbued by such love for the play that it has actually taken possession of these simple people, heart and soul, for generations; and a highmindedness and devotion seem to go with them in all their every-day pursuits. As the good priest says, for five years the whole village speaks of little but the last Passion, and for the next five of nothing but the coming one—of the larger question whether or not the necessary royal permission to present it once more can be obtained, and the equally stirring one as to who will take the principal parts. To give or not to give the Passion Play is first put to vote by the burghers in the Town Hall, as a mere matter of form, for of a possible negative no one ever thinks. Naturally those playing certain parts become thoroughly devoted to them, and are touchingly unconscious that time at last unfits them. Often, however, the part of older persons in the play is assigned to those who have grown past the younger characters. Josef Mayer is thus taken from the Christus representation, and given the important and frequent prologues to recite. To his rendering of the sonorous lines his abundant white hair and beard and majestic bearing give an immense impressiveness. And Thomas Rendl, formerly Pilate, is transferred to the part of Peter, still impetuous and virile, but appropriately older.

At four o'clock in the morning of the day when the play is to be given, the musical jangle of bells from the Moorish-looking church tower calls to early mass, and even at that hour the streets are beginning to fill with an international crowd, many pilgrims arriving on foot from beyond the mountains, their bundles slung over their shoulders. At eight the play begins, in the enormous theatre, where now every seat is numbered, quality and price corresponding. As it progresses, the impression of a really superb mastery of detail grows more pervasive. It is not a play being acted, but a tragedy is lived before us. Not a mechanical flaw appears, and the whole great drama moves on with stately gravity and power. The audience of nearly 4,000 breathes as one person, as scene after scene unfolds and the inevitable end draws near.

In many respects the music is well fitted, composed in 1814 by Rochus Dedler, "teacher, clerk, chorister, and organist" of the village. The melodies are often suggestive of Haydn and Mozart in their simple sweetness, the harmonies sometimes of great dignity, rising occasionally to dramatic climaxes. The orchestra is quite out of sight; and the chorus of thirty-four voices seems hardly forceful enough at times. The fact that the stage is all open to the sky partly accounts for the lack of resonance, but it adds in equal proportion to the scenic setting, as cedar-clothed summits of actual mountains appear beyond the foreground, and high-altitude cumulus clouds gather or disperse as the day goes on.

One of the most amazing features of the performance consists in the frequent tableaux—pictures from Old Testament stories, foreshadowing later events; an idea of the good priest Daisenberger, who about 1860 recreated the Passion Play from the crude form in which it had existed through hundreds of years into the present splendid drama. Often with hundreds of persons posed in striking attitudes, the curtain remaining up for two and sometimes three minutes, not a finger trembled, hardly an eye altered its gaze, from tiny children to old men. And the beautiful conceptions of color and form embodied in these living pictures are no less remarkable.

At noon the great audience disperses for luncheon, reassembling by one o'clock or soon after, and the drama moves on to its tragic ending. It had been a partly shaded day, but at the march to Calvary brilliant sunshine streamed suddenly down upon the stage, lighting up with tremendous effect the pathetic figure bending under its heavy burden, and the magnificent Oriental dresses of the jeering crowd. But after that the sky grew darker, and at the last fatal moment nature conspired with the actors, and heavy clouds moved up over the actual sky, adding weird and terrible impressiveness to a scene already tragic with this story of the centuries. At the final transfiguration the sun once more burst forth in a glory of level rays, and the great cumulus masses clinging about the mountains took on soft roseate and golden tints, anticipating sunset.

An irresistible burst of applause filled the great building as the stately final chorus ended, and the procession moved away—the first allowed all day, and even this was sternly frowned down by many, but it could not be restrained. To-day the crowds have gone, but only to make way for another mighty concourse arriving to-night for Sunday's performance. And Monday still another will provide for the left-out thousands of yesterday. The great story is still a living, daily fact at Oberammergau, and hardly less to the visitor and spectator than to the dweller and performer.

> "To have lived through such a day
> Seems longevity enough."

MABEL LOOMIS TODD.

AFTER PETER THE GREAT.—II.

PARIS, July 11, 1900.

After the death of Peter II., the Supreme Council, which had been instituted during his short reign, assumed the right to determine the rules of the imperial succession, and chose Anna Ivanovna Empress, at the same time imposing certain conditions on her and trying thus to create a sort of Constitution. Dimitri Galitzin was the chief mover and promoter of this reform, but he encountered much opposition to his ideas among the high orthodox clergy, as well as in the ranks of the nobility.

Anna arrived at Moscow on the 10th of February, 1730. She had been for several years exiled in Courland, where she lived with her favorite Bühren. She brought a very hostile disposition towards the Dolgorukis, who pretended to be inaugurating a sort of constitutional government, all the more because the members of the Council which had been formed and which had placed her on the throne, would not permit the return of Bühren. At the funeral of Peter II., which had been long retarded, Natalie Dolgoruki was not allowed to take a place among the members of the imperial family, and she remained at home.

Anna showed her spirit at once, in proclaiming herself colonel of the Preobrazhenskoi regiment, and in pouring glasses of brandy for the soldiers herself; she received very coldly the self-instituted Supreme Council. Ostermann was behind the scenes; he had feigned illness after the election of Anna Ivanovna, but was in active correspondence with the members of the opposition to reforms and with the Tsarina herself. Anna decided to get rid of the reformers, and to assume autocratic power as her predecessors had done.

The *coup d'état* took place on the 25th of February, 1730. The palace was surrounded with troops; the Supreme Council was abolished; the letter in which Anna had declared her acceptance of the conditions imposed on her, was torn by her in presence of her officers. The fragments are still preserved, hidden in the Russian archives. It has long been considered an act of high treason to possess a copy. Constitutional reform had not been well prepared by Dimitri Galitzin; he had done nothing to bring over to his projects the most important members of the nobility, the clergy, and the army. His action was too much inspired by personal motives and by a sentiment of rivalry. In the discomfiture of plans which had for their chief object the creation of an oligarchical force destined to be a check on the autocracy of the sovereign, one thing only was saved, the law of serfdom. "Among this nobility," says Waliszewski, "now decimated and degraded, the low instincts of servility and the savage instincts of a ferocious tyranny seemed alone to survive." The very name of a constitution was proscribed for a century, and when, "a hundred years after the events of 1730, the soldiers employed in the repression of the Polish insurrection could not understand the motives of the war, they were told that the insurgents were fighting for their Constitution, and they imagined that it meant the wife of the Grand Duke Constantine, Viceroy of the country, who had married a Polish woman. Such was the end, after this long term of years, of the movement of ideas which the leaders of the eighteenth century flattered themselves they had propagated among the masses."

The Galitzins fell from their high station one after the other. The Dolgorukis were persecuted; on the 31st of October, 1739, Ivan Dolgoruki was beheaded; Catharine Dolgoruki, who had for a moment hoped to wear the imperial crown, was thrown into a convent. A brother of Ivan, Alexander, was imprisoned and executed on the 28th of October, 1740. The beginning of the reign of Anna goes in Russia under the name of the Bühren régime. When Elizabeth became Empress, she sent for Catharine Dolgoruki, and tried to marry this "fiancée of the Tsar," as she was still called. Catharine resisted long, and finally married a Scotchman, James Bruce; she died soon liam Lloyd Garrison, can "turn the world upside down." The apostles were such men in their day; they were counted iconoclasts and disturbers of the peace, they were stigmatized and hated and persecuted; and every true reformer in Church or State must expect to share in some degree their odium. He must be content to be called narrow and fanatical, and have his name cast out as evil; he must forego the plaudits of the groundlings; he must be deaf alike to all voices of calumny and flattery; he will not be over-much praised by his own generation; his reward will be often a posthumous one; coming generations will confess themselves his debtors.

There is a pressing need at the present time of men who will be bold enough not to be intimidated by the crack of the party whip, and who will contend, as Sumner, and Hale, and Adams, and Garrison, and Phillips contended a generation ago, for the truth and the right, however mighty may be the forces that oppose, and however strong may be the current in the opposite direction. There is need of men who will stand for civil-service reform, for freedom from bossism, for purity in politics, for economy in administration, for national righteousness, for keeping faith with all men, whatever their race, or color, or previous condition of servitude. There is need of political leaders and of a party who will bear in mind, as a first principle of politics, the dictum of Isaiah of Jerusalem—"Open ye the gates, that the righteous nation that keepeth the truth may enter in."

Such men may be but a "very small remnant" at first; but they will have power, because righteousness is always and everywhere a power; and their number will grow, for they will draw to themselves some of the best elements from all parties.

But some man will say, "It is no time to break over lines." So said men fifty years ago, but had not some men been independent enough and courageous enough to break over the lines fifty years ago, so far as we can see, the nation would be under the tyranny of the slaveocracy still. Expediency is not always the best rule of conduct in public or private affairs. The interests of party are not sacred and supreme; the interests of truth and righteouness are. There is a time when resistance to authority is a duty; and there is a time when resistance to party policy is justifiable and right.

"New occasions teach new duties; . . .
. . . . we ourselves must Pilgrims be;
Launch our *Mayflower*, and steer boldly through the desperate winter sea."

D. F. L.

MANCHESTER-BY-THE-SEA, MASS.

Notes.

'The Jay-Hawkers,' a tale of Border Ruffian days in Kansas, by Mrs. Adela E. Orpen, and 'The Law in its Relations to Physicians,' by Arthur N. Taylor, LL.B., are among the latest announcements of D. Appleton & Co. Also, a 'Key to the Flora of the Northern United States,' by Dr. J. M. Coulter, of the University of Chicago.

Harper & Bros. have in press 'Eleanor,' by Mrs. Humphry Ward, in two volumes; 'The Mantle of Elijah,' by Israel Zangwill; 'A Bicycle of Cathay,' by Frank R. Stockton; a new edition of Blackmore's 'Lorna Doone,' illustrated by the camera of Clif- ohnson; and 'Women of the Bible,' by r *American divines.*

A romantic poem, 'The Ballad of the Prince,' by Mrs. Alice Archer Sewall James, illustrated by reproductions of wash-drawings by the author, is in the press of R. H. Russell.

Miss Florence Lundborg's illustrations to the new FitzGerald Omar in preparation by William Doxey, No. 15 East Seventeenth Street, New York, will be in line.

In the magnificent new edition of the well-known 'Handbook on the Diseases of the Eye,' by Graefe and Saemisch, which is now coming out, in fourteen volumes, the subject of the comparative anatomy and physiology of the visual organs is to be treated by Dr. Theodor Beer of Vienna. Dr. Beer is anxious to acquire separate prints of all articles dealing in any way with the organ of sight in animals or in man, or with reactions to light, and he is particularly desirous that none of the widely scattered writings of Americans should escape his attention. Communications may be addressed to him, Anastasius Grün Gasse, 62. Vienna.

The idea of 'Paris as Seen and Described by Famous Writers' (Dodd, Mead & Co.) is attractive, but, if the selections have been well made, it is astonishing how little of interest great writers have had to say about Paris. Thackeray, for instance, knew Paris well, but is down for only a very unsatisfactory account of the Madeleine and a still more unsatisfactory account of the Bibliothèque Nationale. Miss Esther Singleton's translations from the French are frequently dubious and never very easy, so that at least half of her authors suffer a serious disadvantage. The best things in the book are the half-tone engravings, and the worst are the so-called "maps," which are horrible and which actually make it more difficult to understand locality than by the unaided memory.

'The Age of Johnson,' by Thomas Seccomb (Macmillan Co.), is an excellent contribution to the excellent series of Handbooks of English Literature, edited by Professor Hales. It lacks, perhaps, strictly speaking, style, but is written naturally and with some *esprit*, and abounds in interesting detail and agreeable matter. It successfully fulfils its unassuming plan.

'More Colonial Homesteads, and their Stories,' by Marion Harland (Putnams), gives some account, accompanied by illustrations, of several well-known historical American houses, such as Doughoregan Manor, Johnson Hall, La Chaumière du Prairie, and the Schuyler homesteads. Of these the first, as an existing manor, with some remains of its early state, is perhaps the most interesting. We are so much richer than our ancestors that we can afford to look back upon the modest homesteads of most of them with affectionate self-satisfaction. In multimillionairedom some of us build what we call "colonial" houses, but how the colonials would have wondered at our resources! Look at Mount Vernon, *Viator*, and consider its dimensions, and smile when you think that it was the home of the wealthiest American of his day. Times change, and houses with them. The magnate of to-day may convert his predecessor's establishment into a stable, and put up a hotel or castle for himself and be colonial or not, as he pleases. He is above the law. But all who care to do so may take a leaf out of the colonial book, and make a note of the good taste and simplicity in domestic architecture of the period.

'The Graduate Handbook No. 3, 1900' (Cambridge, Mass.: J. H. Patten), consists chiefly of the Proceedings of the Fifth Annual Convention of the graduate clubs whose organ this publication is. For students its most valuable feature is a folding table for ready comparison of graduate schools.

We have received a List of Graduates of Franklin and Marshall College, Lancaster, Pa., with addresses of the living; and the fourth part, completing volume i., of the Obituary Record of the same institution.

The nineteenth annual report of President Carter's administration at Williams College has a significant passage on the virtual abolition of the "day of prayer for colleges," which was a religious holiday, compulsory on all except Roman Catholics, and appointed for the last Thursday in January. It is now relegated to the second Sunday in February. "Very marked changes for the better in the life of educated men in a former generation dated from the observance of this day," says President Carter, but he adds: "That has not been true to any degree of late years." Young men who do not "enter college with the habits of reverence and charity fixed" are little likely to undergo a striking transformation in college.

The *Columbia University Quarterly* for June contains a brief sketch, by the late Dean, Mrs. Emily James Putnam, of "The Rise of Barnard College." She says, in summing up: "Barnard is an independent college for women, with a corporation and a faculty of its own, vested with all the powers commonly belonging to such bodies. At the same time, it shares the library, the instruction, and the degrees of one of the important universities of the world. It is at present the only college in existence of which all these statements can be made." This article is followed by a one-sided men's symposium on the Education of Women, to which all are favorable, while some are unequivocally for co-education.

Besides the Proceedings of the Dialect Society, 1896-'99, the first part of the second volume of *Dialect Notes* (New Haven) is notable for a tentative list of college words and phrases, now current for much the greater part. It is the result of inquiry by circular, and will be made the basis of a second vocabulary.

In his second paper on "Early American Ballads," in the *Journal of American Folk-Lore* for April-June (Boston: Houghton, Mifflin & Co.), Mr. W. W. Newell traces the origin of the familiar New England "Springfield Mountain" in a very interesting manner. The victim of the "pisen serpent at his heal" was Timothy Merrick, August 7, 1761, and what is curious is the resemblance to the ballad of Isaac Orcutt (*circa* 1800), composed expressly as a chant for the funeral ceremonies; and to an "Account of the deth of the child of Daniel and Sarah Beckwith" (1773). Mr. Newell gives several variants of "Springfield Mountain." The melody is not that to which we have been accustomed.

Students of the history of mediæval Italy will thank Count Ugo Balzani for the revised edition of his little work, 'Le Cronache Italiane nel medio evo' (Milan: Hoepli). Some seventeen years ago the book first appeared in English under the auspices of the "Society for Promoting Christian Knowledge," and was shortly followed by an edition of the original Italian. Since then an enormous amount of work has been performed by German and Italian scholars in perfecting texts and determining disputed details, as well as in the publication of hitherto inedited sources. The results of these labors have been carefully garnered by the author in his revision, so that the book may be regarded as now fully on a level with the most advanced criticism on a singularly intricate department of historical material. After the fall of Rome, Italy, though somewhat more than a mere geographical expression, became split into more or less antagonistic divisions whose kaleidoscopic changes and mutual interaction, under the conflicting forces of feudalism, imperialism, theocracy, and democracy, render the task of the investigator unusually difficult. As one of the editors of the great "Regestum Farfense," the author has demonstrated his mastery of the multiform sources of Italian history, and in the present volume he has furnished a welcome guide through the labyrinth, from Cassiodorus to the Villani, written in a clear and forcible style, and enriched with numerous picturesque extracts illustrating the characteristics of the principal chroniclers and of the times in which they flourished.

After many wanderings, the remains of Dante are preserved in a case in the National Central Library of Florence. Signor Chilovi, the head of this institution, has in mind to give the precious relic a fitting monumental place in the contemplated new library building, where a Dante Gallery will be provided. A Deputy, Giuseppe Pescetti, looking to this end, commissioned the sculptor Prof. Rinaldo Barbetti to make a design for an urn, which was duly offered last month to Signor Chilovi. The Librarian, however, felt under obligations to prefer a design made by the sculptor Enrico Pazzi in 1899, on occasion of turning over to the Library the bones which had been in his custody since 1865. This "splendida opera," Signor Chilovi trusts, may be duly executed by the authorities.

Dr. A. Donaldson Smith, the young American who gained a high reputation as a traveller five years ago for being the first to reach Lake Rudolf from the Somali Coast, has just completed a still more interesting and adventurous journey. The unknown country explored this time lies between the northern end of the lake and the Nile. The first part of his route was through an exceptionally charming mountainous region, with stretches of excellent grazing land, inhabited by people more timid than vicious. To this succeeded a vast plain which in the wet season is simply a marsh, in the dry an impassable waterless desert. Attempts to cross this were fruitless, and he skirted its southern edge and finally reached the Nile at Fort Berkeley, the most northerly of the Uganda posts, on March 15 of this year. From this place he descended the river to Khartum in the gunboat of the sudd-cutting expedition. Among his collections are several new species of birds, and ten specimens of the smaller antelopes unknown to him and possibly new to science.

Professor Thilly, of the University of Missouri, objects to our remark, on reviewing a month ago his 'Introduction to Ethics,' that his "classification of the doctrines concerning the basis of right and wrong is substantially borrowed from Wundt (without acknowledgment, by the way)." His demonstration to the contrary presents mechanical difficulties of tabulation not easy for us to overcome, and we must content ourselves with printing his denial either of similarity or of conscious appropriation. To us the resemblance remains. Professor Thilly further allows no originality to Wundt, who does, however, lay claim to it.

—The third volume of Hamilton's 'Writings of James Monroe' (Putnams) opens with Monroe still in France, but unhappy because of a dinner incident and the "ingratitude" of Thomas Paine, who seemed to make him responsible for the Letter to Washington. Indeed, Monroe found his position so uncomfortable that he thought of demanding his recall, yet sought to open a regular correspondence with Bache's paper, the bitterest critic of the Administration. The Cabinet saved him the trouble, and he returned to the United States nursing a grievance, and was met by a demand from Hamilton, indignant on account of Monroe's betrayal of the Reynolds affair. The correspondence on this subject is entirely omitted from the present volume, so that the reader knows nothing of Monroe's cowardly behavior, but is permitted to read his gloating over the exposure of Hamilton. Of course, Monroe is against Washington, and as the same Cabinet was with Adams, his hatred is turned against "our insane President," that "old woman," and he even harbors a thought of calling him personally to account. In debt and with much time on his hands, he sulks in Virginia, urging his friends to defend him from attack, prepares drafts for their use, compiles his ponderous 'View,' chides Bache for not pushing its sale, is haunted by spies, examines the seals of letters to see if they have been tampered with, and asserts loudly that he is assailed by all who are unfriendly to liberty. He was proposed for Congress, but declined, and was elected Governor of Virginia. Occupation sobered him somewhat, but could not alter his sombre view of the conduct of the Administration, least of all of its shortcomings in foreign relations. His messages to the Legislature, which Mr. Hamilton wisely gives in full, are able and interesting. The most vital subject he was called upon to treat was the insurrection of slaves, and, in combination with Jefferson, he sought some remedy, such as a colony to which the dangerous might be sent. The election of 1800 removed his harassing doubts on the stability of government; and his opinions on removal of Federalists from office must be studied to be valued at their real worth. He made an insidious attack on Rufus King, and aided Jefferson in smoothing over a difficulty with that indescribable scoundrel, Callender. He raised the delicate question whether a Governor could exchange letters with the head of a department in the national Government. As Governor, Monroe rises in our estimation, small as he is in many ways.

—We note some unnecessary errors in the third volume, but pass them to comment upon the omission to use Monroe's letter to Jefferson of March 12, 1801, and upon the error in making the letters of November 15 and November 16, 1798, addressed to Jefferson, when Dawson (given as *Davison* on p. 128) was the correspondent. The letter to Madison, dated July 5, 1796, is full of errors. Jay was "forbidden to *weaken*," not to *make* engagements, and his object was to *procure* not *cost* us the respect of the English court (p. 21). On the next page, the letter was six months *old*, not *April;* while Monroe wrote of the *motive*, not *nature*, of this conduct (p. 23). The cipher seems to spell a *desultory*, not *desperate*, movement, and the opening sentence of the last paragraph on p. 23 has been altered beyond recognition by the editor. He makes Monroe say "[through] timid influences," though the cipher says "odium lies." On p. 24, the printed text speaks of an "appeal to the *fulfillment* itself and a different *merit* may be found"—a meaningless phrase, until by means of the key the words *government* and *spirit* are found. This is slipshod editing.

—The President of the American Museum of Natural History, New York city, in his latest annual report, gives a summary of the work accomplished during the year by the different exploring expeditions under the control of that institution. Harlan I. Smith of the Jesup North Pacific expedition has established the southern limits of North Pacific culture, and of the distribution of cairn burial on Vancouver Island, besides making a collection relating to the archæology of the Puget Sound region and the interior of southern British Columbia. Capt. George Comer has made a collection illustrating the arts and customs of certain Eskimo tribes on the west coast of Hudson's Bay; that from Southampton Island being remarkable on account of the primitive character of the tribe, "which has never been visited by whites, and is still living in the stone age." Roland B. Dixon, in studying the vanishing customs of the Plains Indians, has accumulated considerable information concerning the ethnology and language of the Maidu Indians of northern California. He has also collected specimens of their utensils, basketry, and feather ornaments, and has secured a series of casts and photographs illustrating the type of people. Another important collection, illustrative of the ceremonials and the symbolism of the Arapaho Indians, has been made by Alfred L. Kroeber, who has acquired new and valuable information in regard to the significance of the Arapaho decorative designs. The Hyde Southwestern Expedition has continued the examination of the ruins and burial places in the Chaco Cañon, New Mexico, and its neighborhood, as part of a general survey of the archæology of the region included in the adjoining corners of Colorado, New Mexico, Utah, and Arizona. Much time has been devoted to a study of the facts relating to the antiquity of the ruins of Bonito, and to the cause of the desertion of this pueblo by a numerous people after much labor had been expended in house building and in irrigation. There has been secured an important collection from the ancient burial caves in Grand Gulch, the remains of a people evidently distinct from the builders of the stone pueblos and cliff-houses. The researches by Dr. Bandelier in Peru and Bolivia have been continued, and a shipment of specimens found in the vicinity of Lake Titicaca, illustrating the highest stage of prehistoric civilization attained in South America, is on its way to the Museum. The exploration of the Trenton gravels and of the Delaware valley has been prosecuted by Ernest Volk. Several stone implements have been found *in situ* in what competent geologists admit to be the deposit made at the close of the glacial period. There has also been discovered a fragment of a human femur, which was *in situ* seven feet from the surface in the sand layer beneath the undisturbed glacial gravel. The bone is chalky, bears upon its surface certain striæ having the appearance of glacial scratches, and is probably as old as the deposit in which it lay. In the same neighborhood, three fragments of a human parietal bone were found on the recently fallen talus, in such a position that they had evidently been dislodged from the sand layer under the gravel. Like the femur, they were chalky, striated, and stained by iron from the gravel.

—An account of the first winter ever spent by men on Antarctic land was given recently to the Royal Geographical Society by Mr. Borchgrevink, the head of the expedition. This consisted of six scientific observers and collectors and four assistants. Their camp was built on Cape Adare, Victoria Land, and magnetic and meteorological observatories were established. Meteorological observations were taken every two hours, day and night, and magnetic observations whenever the conditions were favorable. Great difficulty was often experienced in taking these, from the tremendous gales which raged; the wind in one instance attaining a velocity of 102 miles an hour. On these occasions the observer was connected by a rope around his waist with the hut. The greatest cold was experienced in August: —52° Fahr. The height of the surrounding land—in one place it reached nearly 12,000 feet—made any attempt at exploration exceedingly dangerous, and it was impossible to reach the interior. The conditions are less favorable for exploration than in the Arctic regions. There are no bears, foxes, musk oxen, or reindeer; and accordingly the expedition was obliged to live on birds, eggs, and fish. The only animal life mentioned besides these was a number of insects of three distinct types found among the mosses on Geikie Land. When exploring at the foot of Mount Terror, Mr. Borchgrevink and a companion were witnesses of the birth of an iceberg. "With a deafening roar, the huge mass plunged into the sea, and a white cloud of water and snow hid everything from their eyes. A wave rose like a wall from the plunge of this gigantic ice mass, and seemed to grow rapidly as it approached the low ledge where they stood. Instinctively they ran to the highest part of the beach and stood close to the perpendicular mountain wall. The time seemed long drawn out. The wave first struck Mr. Borchgrevink; lumps of ice were driven against his back; he felt the blood rush forward from beneath his nails as he clung to the rock. The icy water passed over his head, and when it receded Capt. Jensen was still by his side. Several waves followed in succession, but none so high as the first. . . . The water marks showed that the first wave had reached a height of 20 feet above their heads." The expedition, with the loss of one man by sickness, sailed for home on March 2, just a year from the time of its landing. It is, of course, too soon to estimate the value of its scientific work, but the observations seem to give the approximate place of the magnetic pole in latitude 73.20° south and longitude 146° east. "But it was not stationary."

—Nine years ago the Society of Historical Theology of Oxford appointed a committee to prepare a statement of "the *principal results of modern inquiry* into the composition of the first six books of the Old Testament." It took this committee, composed of Messrs. Harford-Battersby, J. Estlin Carpenter, Fripp, Montefiore, Selbie, and Cheyne, to whom were added later Buchanan Gray and W. H. Bennett, four years to prepare and revise the analysis of the books under consideration. The work of publication was then assigned to Messrs. Carpenter and Harford-Battersby, with freedom to elaborate, explain, and change, as might seem to them desirable. The result is two large octavo volumes entitled 'The Hexateuch,' covering in all about 650 closely printed pages. While printed under the auspices of the Society of Historical Theology, with "the liberal aid of the Hibbert Trustees," and based on the analysis made by the above-mentioned committee, the work is that of the editors, and especially of Professor Carpenter, and they are responsible for the views presented. The first volume discusses the composition of the Hexateuch. It contains an admirable review of the history of criticism, the best yet published; a statement of the general grounds of the analysis, the contents and characteristics of the documents; the history of their composition, redactions, and union, as far as these have been worked out; word-lists and tables of laws and institutions. To this volume Professor Cheyne has contributed one chapter on "Criticism and Archæology." The second volume contains the text, with a special introduction to Joshua. The principal documents are arranged in parallel columns, further subdivisions being indicated by the use of different type. By the exercise of some ingenuity, for which the editors express their thanks to "the controller of the University Press and his assistants," this columnar arrangement has been so handled as to make consecutive reading no difficult task, at the same time that the relations of the parts are clearly shown. Marginal notes refer to Biblical and other references, and abundant foot-notes explain the special grounds of analysis. The translation is that of the Revised Version. The editors belong to the most advanced school of critics, but their work is at the same time soberly and cautiously done, in a fair spirit, without apparent theological or controversial bias. While these volumes are of the first importance for Old Testament scholars, the price ($12.00) puts them beyond the reach of most, except as they can consult them in libraries. The work bears the imprint of Longmans, Green & Co.

—'La Protection Ouvrière au Japon,' by Saïto Kashiro (Paris), is a short but valuable treatise written by one who has had every opportunity to become acquainted with the details of his subject. The volume is really a discussion and criticism of the various articles of a proposed labor law—a discussion giving occasion for a general description of labor conditions. The striking feature of Japanese labor is its attitude of submission to the employing class, though this attitude is being modified as time goes on. State interference in the form of protection to labor has been unpopular, and the ignorance of the working classes has allowed of an almost complete neglect of hygienic measures in industrial establishments. Pensions in case of accident, premiums for regularity, etc., are meagre. Twelve hours is the average working-day, and women and children are everywhere seen laboring. Wages are small, and rarely exceed fifty cents a day for the very most efficient male hands. Advancement in wages is slow, and there is little opportunity to save; low wages here coexist with an absence of habits of economy. Compulsory "saving" is common, but is really a disguised method of retaining a hold upon the laborer, for he is forced to serve out his contract and obey strict regulations under penalty of confiscation of the savings remaining in his employer's hands. Japanese laborers soon tire of the routine and monotony of machine-production, and are readily led to desert their employers; a class of intermediaries display much rascality in connection with these desertions. A system of laborers' certificates also has been put into operation in order to restrict the movement of labor. Saïto regards this as an unwarranted hindrance to the competition of developing industries. Short chapters treat of factory regulation, inspection, etc., and of apprenticeship. The book is full of very suggestive facts and figures, and the author shows a remarkable power of expression in a foreign tongue.

McMASTER'S HISTORY.

A History of the People of the United States, from the Revolution to the Civil War. By John Bach McMaster. Vol. V. 1821-1830. Appletons.

As Mr. McMaster resumes his pen, the era of good feeling under Monroe is drawing to a close, and the legitimate effects of Jefferson's policy in party matters are coming to the surface. If "the people" were to be the controlling factor in representative government, they should at least be able to elect their President, and restrictions on an expression of their opinion should be removed. The spectacle of Congress neglecting public business in order to intrigue for Presidential candidates was not edifying, and the Congressional caucus was opposed by many as an unwholesome evidence of partisan activity, and by more because it interfered with the freedom of the people to decide the choice of President for themselves. The opposition to the caucus, taking different forms in the different States, did result in an important change of methods of choosing a President; but this change was accompanied by the abolition of qualifications required of the voter, by an extension of elective offices, and by the rise of a party machinery the perfection of which for its own purposes has rarely been equalled. In introducing a needed reform, much more than was required had been obtained from the people; and the campaign which placed Adams in the Presidency through the intervention of Congress, was largely responsible for that which made Jackson the successor of Adams.

The best chapter in the volume before us is that describing the election of Andrew Jackson to the Presidency in 1828. It is astonishing as well as mortifying to read again the details of that crowning success of "machine politics." Mr. McMaster has marshalled his facts in an able manner, but with not so much as a suggestion that the Administration of Adams had been much above the average in ability, or that it was largely because Adams sought to be an active President—one of opinions and resolved policy—and refused to prostitute appointments to office for political vantage, that he was defeated. His very courage and upright conduct gave his adversaries ground for combination (for union was not possible), and enabled them to elect a man of no opinions, and few qualifications for the office. The charges against Adams and Clay have long since been classed among the fictions that serve for campaign purposes only, and the surprising use made of them by Jackson and his followers, in the face of denials as true as they were solemn, gives the campaign of nearly three years a picturesqueness of which the author has made good use. He does not mention the probable authorship of the Kremer letters, though even at the time it was recognized that this obscure member of Congress was incapable of doing what was done in his name. Adams, in his Diary, says the writer was McDuffie or Ingham; and Rufus King, representing a party opposed to Adams, says it was McDuffie or Hayne. As the two authorities name McDuffie, the probability is strong that the South Carolinian was the responsible person, and his bitter attacks on Adams, and iteration of the charge of the bargain with Clay, lend color to this view.

In making the "people, and not the leaders" responsible for the general looting of offices under Jackson, Mr. McMaster goes too far. He says:

> "In the course of events the time had come for a departure from old-time methods, and, whatever may be thought of the character of that change, it had to be made. No leader in our country can debase the people. He is exactly what the will of the people enables him to be, and the moment he ceases to execute that will he ceases to be a leader."

This doctrine will excuse any incapable head of a party for any misdeed. Who were "the people" at that time? Jackson received 647,276 votes and Adams 508,064; were the opinions of this weighty minority of no moment? It was known to include the intelligence and wealth of the country, and, had the qualifications surrounding suffrage in the older States been retained, would not have been overwhelmed in defeat. The doctrine announced is destructive of all independence and leadership, and proclaims that the man who keeps his ear to the ground, and obeys the passing murmurs of the "people"—that is, a noisy majority—is greater than he who has convictions and does not fear to stand by them. The orgy of spoils that came in with Jackson has been repeated more than once, and weakness has often been taken for strength; but it is to be regretted that the calm historian can be found to write in defence or excuse of both. It is the more to be regretted as our author denounces elsewhere the decision of a contested election on purely partisan grounds, as "that foul deed of which the history of legislation in our country affords many instances."

The chapter on the "Common School in the first Half-Century" is an example of the merits and demerits of Mr. McMaster's methods. The history of legislation concerning schools in each State is traced; the source being, as a rule, the monographs of the Bureau of Education. As the schools were among the subjects of State control, the action of one Legislature did not affect that taken in the neighboring States, and a separate description gives a fair conception of the condition of education in each State. But why was this subject introduced in this volume at all? The description begins with the act of 1647 passed by the General Court of Massachusetts, and passes to vague mention of an attempt in 1829 to establish common schools in Tennessee. After some thirty pages of detail it is annoying to find the subject summed up in the sentence, "But the common school, the school for the children of the people, was still to become a great American institution."

Continuity of view is sought by constantly returning to the same subject, and prefacing new developments by extensive summaries of what has gone before. In describing the political ideas of the first half-century the author carries the reader back to the opening of the Revolution and the framing of the first constitutions. Ten pages of recapitulation, one-sixth of the chapter, are required to bring us to the first act proper to the period covered by this volume, to the Constitutional Convention of New York in 1821; and this summary is to open the question of suffrage qualifications. In the same chapter, the debates in the Constitutional Convention of 1787 on the Presidency, the changes in the manner of nominating and electing Presidents, the uses of the annual messages, and the rise of the Cabinet, are detailed in order to show that no President had believed in three terms, and that the election of 1824 led to abortive efforts to amend the Constitution so as to prohibit a third term. Eleven pages are thus consumed by matter which may largely be found in the earlier volumes, and in proper connection with the course of the narration. As political ideas Mr. McMaster also includes the decision of courts on the Constitutionality of legislative acts, the admission of a new State from territory outside of the original bounds of the United States, and the assertion of States' rights on sundry occasions. After so much wealth of incident, expectation is aroused, and some definite advance in political theory or methods should result. But this is what we get:

> "Dissatisfaction with the executive office as defined in the Constitution was now widespread. The length of his term, the manner of choosing him, his eligibility to frequent reëlection, were the causes of seventy-five propositions to amend the Constitution between 1820 and 1830. A single term, a direct popular vote, and the exclusion of members of Congress from offices within the gift of the President, were the popular political ideas."

Was it worth all these sixty pages to learn that indefinite fact, for indefinite it must remain? The attempt to secure continuity really results in breaking the little connection the chapters might have had. It remains true that each chapter is an essay by itself, and the reader is obliged to pass from one volume to another without the aid of the author—a fault which can be remedied only by the exercise of a faculty that Mr. McMaster does not possess. The nine volumes of Adams's History make a continuous story, told on a definite plan, and with consistent purpose. The last chapter is as inevitable as the first, both in form and in substance. Any one of McMaster's chapters could appear in a magazine, and be readable; but each stands by itself in this volume as isolated as it would in a magazine.

It is not often that a historian alters his point of view in conformity to passing events. The dignity of history is opposed to such an exhibition, but a recent history of the American Revolution offers an example of it, and Mr. McMaster's present volume another. In his opening chapter he gives an account of the efforts of the Spanish republics to obtain independence, and describes the measures leading to the announcement of the "Monroe Doctrine." He cites the suggestion of Canning that England and the United States unite in a declaration that "while neither Power desired the colonies of Spain for herself, it was impossible to look with indifference on European intervention in their affairs, or to see them acquired by a third Power." In a later chapter the Monroe Doctrine is again the subject, and the assertion is made that England would probably use her arms against the Holy Allies, and that "her reward for such help would be Cuba and Porto Rico seemed certain, and at the prospect of such a transfer Monroe became anxious. The possession of the islands by a decaying Power such as Spain was one thing, but their ownership by a great naval Power, such as Great Britain, was another, and a very different matter; hence Monroe's Doctrine." It is difficult to reconcile these two accounts. The fear of English occupation was hinted during the spring of 1823, and constituted the basis of Adams's dispatch to Nelson on April 28, which Mr. McMaster makes follow Monroe's anxieties. During the summer even Jefferson, who had no love for England, laid aside his jealousy of her possible intentions on Cuba, and in August Rush sent forward Canning's suggestion. This was considered by Monroe and his Cabinet on November 7, and the President's message announcing the now famous "Doctrine" was transmitted to Congress early in December. It was not the fear of the English acquiring Cuba that led to the promulgation of the Doctrine, and subsequent events proved this.

In recording the somewhat picturesque customs of the day, Mr. McMaster has shown his usual judgment, and his industry in this direction makes his volumes a mine of interest. The beginning of New York city, and the curious regulations for street-cleaning, for teaming, and fire protection; the introduction of gas, which met with opposition from the candle-makers and oil-dealers; the rise of a market for coal, which increased so that, in 1825, house-holders were warned against throwing their coal ashes into the streets; the opening of the Erie Canal and the first railroad projects—in such topics the author is at home, and from the columns of the newspapers of the day compiles a highly readable story.

MERIVALE.

Autobiography of Dean Merivale. With Selections from his Correspondence. Edited by his daughter, Judith Anne Merivale. London: Edward Arnold. 1899.

The contents of this volume, with the exception of a few letters to Dean Lake, were printed privately a few years ago. Their character was such as to demand for them a wider publication, and the general reader has much reason to be glad that this has been conceded. Dean Merivale is described upon his monument in Ely Cathedral as "caustic in wit," possibly with reference to his conversation. There is plenty of wit in this memoir, but caustic, for the most part, it is not, and it is more delightful than if it were so habitually. It is a pity that the autobiography could not have been extended, like that of Gibbon, over the historian's entire career. It would then have been as adequate a companion to his 'History of the Romans under the Empire' as Gibbon's to the 'Decline and Fall.' It stops short with his obtainment of a Cambridge fellowship in 1833. But the letters begin at 1826 and come down to 1891; and while they have not the continuity that a complete autobiography would have, they do much to fill the gap, and are vivacious and entertaining to a degree surpassing the autobiography.

Few examples of the child's paternity of the man are more striking than the one we have here, where the boy of six summers plays Roman History around St George's Square, assigns one piece of the walk to Italy and a part of that to Rome; parallel lines of the flagging representing good or evil qualities, and the careers of the Consuls being denoted by the lines taken by the hoops driven by Charles and his brother Herman back and forth. "The strict line of public virtue was the narrow path of the kerb-stone, and few magistrates kept it to the end." He was the smallest and youngest boy at Harrow, his description of which, as it was in 1818, is a permanent contribution to the educational history of England; as, too, is his account of Cambridge as he found it a few years further along.

In 1824 he was offered an East Indian writership, and went to Haileybury, where the instruction was adapted closely to the needs of the Indian Service. This meant an arrest of his classical studies, in which he had done well at Harrow, learning thousands of lines of Latin poetry, including the whole of Lucan. As time went on, he found out that he did not want the Indian writership. The patron who had offered it was much disgusted, and turned over his offer to John Lawrence, "who went to India as a writer, distinguished himself by many eminent services till at last he became the main instrument in defending the Empire at the time of the Mutiny, and was rewarded with the Governor-Generalship and the title of Lord Lawrence." "And thus it was," says Merivale, "that I saved India." To better this story, the Dean tells another of his declining to review Miss Beaufort's 'Syrian Shrines.' It was turned over to Percy Smythe, afterward Lord Strangford. His review did not please the lady; correspondence ensued, a meeting, a marriage. Once at a Harrow luncheon the Viscountess Strangford and Lord Lawrence both sat before the Dean, little imagining that they owed to him their fame and fortune.

It is significant that the book which most caught Merivale's fancy at Haileybury was Gibbon's autobiography. His brother was at Oxford, and it would have been delightful to follow him, but to save time he went to Cambridge; here, as elsewhere, everything conspiring to give a perfectly congenial direction to his life. In 1829 he took an oar in the first university boat race between Cambridge and Oxford. So slender was the interest in the race that not thirty men went from Cambridge to Henley to see it. It was as if they had some painful premonition of the event, which was fatal to the Cambridge boat. The same year, Tennyson being "too proud or too shy to exhibit himself on such an occasion," Merivale "spouted his verses [Timbuctoo] with considerable effect"; and "I have always had," he says, "a kind of quasi-parental regard for them." He got his fellowship in 1833, and at that point brings his autobiography to an end with an extremely liberal discussion of the relations of Churchmen and Dissenters. He never forgot that his grandparents were Unitarians, and their examples qualified his judgment of dissent his whole life long. He writes of his grandmother: "She, too, was a Unitarian to the backbone; but no one seemed to be nearer to the Bible, nearer to Christ." His criticism upon Unitarians is that they get their opinions too exclusively from the Gospels, not enough from St. Paul's Epistles.

The letters following the autobiography are divided into three sets, written respectively at Cambridge, Lawford, and Ely. In 1841 we find him working on a 'History of Imperial Rome' for the Society for the Diffusion of Useful Knowledge, but the scheme fell through. Here, however, were the "seeds and weak beginnings" of his 'History of Rome under the Empire,' the publication of which began in 1850, and ended in 1862. After reading Miss Burney's letters, he writes a long one in her manner, describing the reception of the Queen and Prince Consort at Cambridge in 1843. It is excellent fooling, but even better is the letter of December 6, 1851, exposing Louis Napoleon's planning of his *Coup d'État* on the lines indicated in chapter iv., volume iii., of Merivale's History. This letter having been taken seriously, Miss Merivale is obliged to explain in her preface that Louis Napoleon "did not buy a thousand copies of that work for his regimental libraries, nor did the author receive from him the Cross of the Legion of Honor."

In 1848 Merivale accepted a living at Lawford, a village of 900 people, with an income of £800 a year. In this quiet place he remained until 1869, when he was made Dean of Ely. At Lawford the History was written. The letters do not contain many reflections of Merivale's work upon it. One of the most interesting is concerning Nero's persecution of the Christians, Tacitus's account of which is quite certainly a distortion in some sort of the actual occurrence. Merivale takes kindly to the suggestion that Nero's levity while Rome was burning may be accounted for by supposing him to have been well insured. Having written an article on the topography of Rome, he is afraid that Elwin, the editor of the *Quarterly*, will keep it in pickle so long that "recent discoveries will disprove it all over and over again before it appears." There is a very interesting letter on the Vatican busts of the different Emperors.

Comments on current politics abound, Merivale's opinions being generally Conservative, with some Liberal aberrations. Of Macaulay's funeral in the Abbey he writes that the most suggestive thing was a little clever-looking boy, "perched on a railing, surveying all the crowd, whom, if he lives, he will see under ground, and treasuring up, no doubt, in his mind memories to repeat seventy years hence to our grandchildren." Merivale, looking round on the "very noble mob," asked himself what candidates were there for an Abbey burial, and could light only upon Thackeray, whose bust alone is there; his grave at Kensal Green. The comment is severe on Jowett's opinions as put forth by his friends during the 'Essays and Reviews' ferment, to show "how amiable and sentimental and devotional" they really were. "They seem to me," says Merivale, "to indicate great effeminacy of mind. Heresy should be made of stronger stuff." In 1861 he is "glad that Virginia has seceded," but does not "see what there is to fight about," and hardly thinks there will be real war. The historical sense, it would seem, does not work forward as well as backward. He is glad that his sister does not find his sermons extravagantly fanciful. "A witty man might say that I make out the Apostles to be gentlemen who kept yachts on the Lake of Gennesareth." He tells that Thackeray cried out on one of his witticisms, "I beg your pardon, sir, but have you any further use for that? I think it is worth half a crown." In 1863 he was made Chaplain of the House of Commons: the duties were five minutes' reading of prayers for five days in a week for a period of six months; the salary, £400. He was not too reverent of the office, writing to his wife of one of his first readings, "I have just done my bow-wow." There is too much of prophecy in his estimate of American affairs in 1866. He foresaw the collapse of the negro franchise in the South, to be followed, he thought, by some system of forced labor retaining the substance of slavery. His views of such matters were substantially those of Carlyle. Of President Johnson he writes: "He is an abler man than we supposed."

One of Merivale's most drastic comments is on Grote, page 296. One of his most cynical observations is, "The doctrinaires wonder at the little wisdom by which the world is governed. Precisely so—if it were governed by greater wisdom it would be ruined." Ritualism gets hard knocks: "I believe that such a system fosters a triviality of mind, weakening and emasculating. It lowers men to women and women to worms." Macaulay, as seen in his Journals, he finds "totally devoid of both the sexual and spiritual feelings." He is severe upon the New Testament Revision; thinks his colleagues "knew very little English," and, in view of the translation "evil one" in the Lord's Prayer, is pleased to hear "that some of the sly people in the North call Bishop Lightfoot ὁ πονηρός." Of Thomas à Kempis's "Imitatio Christi" he writes, "I took occasion once to look through it to see whether it says one word about 'doing good' which is so characteristic of our Lord's doings on earth. There is not a word about it." The last letter bears date of December 27, 1891, two years to a day before Merivale's death. He had just been making out a list of friends and acquaintances still living and over eighty years of age. He had counted sixty-three—as if the good fortune which had followed him through life was with him still.

The Banker and the Bear. By Henry Kitchell Webster. Macmillan.

The Minister's Guest. By Isabel Smith. D. Appleton & Co.

The Man that Corrupted Hadleyburg, and Other Stories and Essays. By Mark Twain. Harper & Bros.

The Reign of Law: A Tale of the Kentucky Hemp-fields. By James Lane Allen. Macmillan Co.

'The Banker and the Bear' is "The Story

of a Corner in Lard," and is entertaining reading. The characters may not all be highly probable, but they act, on the whole, with self-justifying consistency; the incidents, many of them, are highly improbable, but at least they are linked together with due regard to cause and consequence. The unvarnished way of telling the story is absolutely appropriate, and the writer has the happy knack of not dwelling too long on any one episode. If the scenes at the Stock Exchange ring somewhat familiar, and if a run on a bank is not a perfectly new invention, in the financial story, yet there are original devices of treatment in both cases; and the women characters, though we regret that the author selected for his heroine the name of Dick, are something more than the usual lay-figures in such tales. All in all, it is a brisk little book, clever and readable. A good example of the writer's style and temper is furnished in the sentence, "The sentiment which gets a man into a difficulty rarely stays around to help him out of it."

The scene of action of the modest novel, 'The Minister's Guest,' alternates between two English parishes—St. Radigund's, Kent, and Dissenting Duck Lane Chapel in a Midland country town. A blithe little girl who has affiliations with both rectory and manse, flits to and fro as connecting link. From the rector she learns to ride, fish, and make trout-flies. With the minister she studies Greek. The contrasting temperaments, character; and aims of the two men are excellently and humorously depicted; and no less so, the surrounding family and parochial groups. Over against the rector's genial and largely veterinary ministrations among his Kentish hop-picking parishioners are set the kindly austerities of the Rev. Josiah and the hard, dry, narrow virtues of his Non-conformist flock. The writer has a marked gift for characterization, and makes us familiarly at home in both places; demonstrating, moreover, that love-making can flourish on the most arid soil.

To any one desiring to read a thrilling account of a true shipwreck, told with masterly art, we commend "My Début as a Literary Person" in Mark Twain's collection of stories reprinted from sundry magazines. The following one, "From the London *Times* of 1904," is not only an ingenious scientific forecast, but a pungent satire on the Dreyfus trial. The paper on the Jews reads as forcibly as it did when it attracted attention in *Harper's Monthly*, a year ago. It points out the fact that the persecution of the Jews at present is a business passion, not a religious one, and reminds the Asian Mystery that they are banded together only in their charities, where they are omnipotent. The chapter on the Austrian Parliament is a brilliant contribution to the history of contemporaneous legislative manners. "Travelling with a Reformer," as Mark Twain does it, is full of suggestion as to the right way to work and the real ear to reach in the redressing of public grievances. In another article, he gives a deeply interesting account of "The Master of Palmyra," as played at the Burg Theater in Vienna, and points the moral by sighing for a theatre in New York where only great tragedies shall be played, that we may have "an occasional climb among the pomps of the intellectual snow-summits built by Shakspere and those others." There are funny stories, too, and we have the latest word from the Jumping Frog, who has now jumped back two thousand years into Bœotia (personally conducted by Dr. Van Dyke), forward into the *Revue des Deux Mondes*, and back into the author's retranslation. We venture to remind this Wandering Jew among athletes that jumping is, as the old English reading-book says of cricket, "a manly exercise, but full of admonition."

Mr. James Lane Allen is still loyal to Kentucky; he is still a devotee of Nature, and can describe her moods with loving fidelity; his chief interest is still the problem of a soul—or, preferably, a pair of souls; and his writing has gained in force, precision, and beauty. These are the main inferences we draw from 'The Reign of Law.' The book has its oddities and impossibilities. In that curious essay—half poem, half table of statistics—on "Hemp," which Mr. Allen prefixes to the whole, we see the decline of the hemp-growing industry in Kentucky a *vera causa* of the decline of American shipping. This is no more serious a dislocation, or inversion, of the facts than is Mr. Allen's turning back the theological dial several degrees. Just the ferment of new thought troubling the old, which he precisely locates in Kentucky during the sixties, could not have been discovered anywhere in this country at exactly that date. But we have been authoritatively assured that it is absurd to suppose Mr. Allen subject to the limitations of time and space, in these high matters; so, as far as mere chronology is concerned, we must perforce say, "With thee conversing, I forget all Time," and stay the critic's hand. But we are bound to record our sense of unnaturalness in a theological struggle that never could have been on land or sea, when we come to the details of Mr. Allen's David wrestling with the angel of doubt, and not letting it go till it blessed him. Through all this we remain unconvinced and obdurate, willing captives though we yield ourselves even here to the idealistic charm of the style, and much as we appreciate—none more—the poetic delicacy of the author's mind and manner. Amid all our noisy and knowing "realists," and the crowding of the novelists made mad by much historical learning, Mr. Allen pursues his vision splendid as one apart.

The Philosophical Theory of the State. By Bernard Bosanquet. Macmillan Co. 1899.

The title of this essay is somewhat pretentious. It had been more modest in the author to call it *a* rather than *the* philosophical theory. For our own part we should prefer to entitle it a metaphysical theory of the State. It is substantially Hegelian, and has its roots in the doctrines of the mediæval Realists. We do not find that Mr. Bosanquet has contributed much that is novel to this ancient theory, although his exposition of it is in many respects commendable. His tone is at all events entirely free from harshness, and while he sometimes obscures his points by verbosity, be generally makes them clear in the end. But the criticisms that were originally made of the assumptions of Realism are as applicable now as then. We have only to ask the question, Is the State an entity in the same sense as a human being? in order to find out that the conception of *universalia ante rem* is practically untenable. We can see, and hear, and touch human beings, but States have an invisible and intangible existence. Just so soon as we begin to reason of the State as if it were an independent reality instead of an abstraction, we inevitably make it a being superior to man, and it is but a step farther to make rulers beings superior to their subjects.

The particular form in which this fallacy is advocated by the school which Mr. Bosanquet represents, is that of the wills of man. Voluntary action may be of two kinds; it may be in response to desires and impulses, or it may be in accordance with enlightened reason. In the latter case we have the *real* will in operation. When a man does what we think he ought to, we say that he is acting according to his real will. When he does what he thinks he ought to, but what we think he ought not to, then he is not carrying out his real will. That, of course, is not the way in which Mr. Bosanquet puts it, but it is necessarily implied in his theory. We may grant that "the good at which I aim extends beyond my trivial or momentary self—that is to say, is universal as against myself as particular." But the great question, so far as human liberties are concerned, is whether I am to judge of this good, or to take the judgment of some one else.

"The average individual," Mr. Bosanquet asserts, "such as each of us takes himself to be in his ordinary trivial moods, when he sees, or thinks he sees, nothing in life but his own private interest and amusement—this average individual is no longer accepted as the real self or individuality." In order to be ourselves, we must be always becoming something which we are not. Hence, we may speak without a contradiction of being forced to be free.

> "It is possible for us to acquiesce, as rational beings, in a law and order which, on the whole, makes for the possibility of asserting our true or universal selves, at the very moment when this law and order is constraining our particular private wills in a way which we resent, or even condemn. Such a law and order, maintained by force, which we recognize as, on the whole, the instrument of our greatest self-affirmation, is a system of rights; and our liberty, or, to use a good old expression, our liberties, may be identified with such a system considered as the condition and guarantee of our becoming the best that we have in us to be, that is, of becoming ourselves. And, because such an order is the embodiment, up to a certain point, of a self or system of will which we recognize as what ought to be, as against the indolence, ignorance, or rebellion of our casual private selves, we may rightly call it a system of self-government or free government, . . . all of us, as casual private units, being subject to an order which expresses, up to a certain point, the rational self or will which, as rational beings, we may be assumed to recognize as imperative."

No doubt anarchy is intolerable. Under the worst of despotisms there may be more liberty than under no government at all. But the reason is that, where anarchy prevails, force, arbitrary force, is all-powerful. Government differs from anarchy for the better in the degree in which force is dispensed with, and the best society would be that in which individuals are constrained by their own consciences and by public opinion rather than by law. The theory which Mr. Bosanquet elaborates does not sufficiently distinguish the rulers, who exercise force, from the society—which is properly the state—which acts by moral suasion. A state, or society, may thus have a very different constitution from its government. The "real will," to use Mr. Bosanquet's expression, of the society may be hostile to the will of the rulers. Rulers are to be regarded as quite as capable of thwarting the ends and ideals of a society as of promoting them. But the tendency is almost irresistible to regard the Government as expressing the will and aim of the subjects.

Mr. Bosanquet's examination of the views of Rousseau and Mill is interesting and effective, but we cannot comment on it. We are approaching, in this country, a period of Constitutional agitation and possibly modification which will turn the thoughts of our citizens toward the discussion of theories of the state, and such books as this will command readers. While we cannot accept Mr. Bosanquet's fundamental assumption, there is much in his argument that is suggestive, and we commend his careful essay to all students of political science.

The Life of Madame de Longueville. By Mrs. Alfred Cock. Charles Scribner's Sons. 1899.

Mrs. Alfred Cock writes the first Life of Mme. de Longueville which is to be found in English, and, apart from critical or biographical essays, no French author has made her his special subject since the days of Bourgoing de Villefore, 160 years ago. From the death of Richelieu to the end of the Fronde she had a career which is without parallel among the lives of French women, and into which the most exceptional elements enter. To the highest lineage, to youth and beauty, to command over her brother, the hero of Rocroi, she joined ambition and a restless spirit of intrigue. The court of France provided scope for her attractions, and the minority of Louis XIV. permitted her plots to multiply. As it was an age of memoirs, stories about her abound, and even the weightiest works of history are filled with references to her name. Some knowledge of her actions and character will always be a good introduction to the study of the period when the nobles of France rallied for their last revolt against the Crown.

Without the aid of her elder brother, Mme. de Longueville might have accomplished something in politics, but her influence over the Duc d'Enghien (or Condé, as we may more fitly call him) brought schemers to her side who would never have joined her but for their confidence in a great general. She had the pride of the Bourbons and their love of power, with about an average share of the tactlessness which that family has ever displayed. She could organize a "Cave of Adullam," but could not hold the disaffected together. Mazarin's wretched system of finance, in addition to his Italian birth, had so stirred the nobles and the nation that Mme. de Longueville and her faction needed only to observe a masterly inactivity. They lost the game by their stupid haste. As a statesman, Mazarin had failed on the domestic side as clearly as he had succeeded in his foreign policy. When the peace came, a heavy reckoning with the nation was in store for him. De Retz and Mme. de Longueville tried intrigue where none was required. tarving Mazarin out of his po- challenged him to a duel with ch he could use better than

We comment thus on Mme. de Longueville's part in the wars of the Fronde because Mrs. Cock makes the political aspect of her heroine's life more prominent than the personal. She avoids taking the view which the Comte de Ste.-Aulaire has espoused, namely, that the Frondeurs had noble purposes and might, if successful, have anticipated the French Revolution. But if she cannot praise the cause, and if she acknowledges the Duchess's love of heading a coterie even when it led straight towards treason, she shows herself rather too indulgent in her analysis of motives. We cannot think that Mme. de Longueville was very deeply stirred by the popular grievances of which Paris became the champion. She shared the turbulence of the great feudatories who had lost their power at the end of the Middle Ages without losing their pride. She would be second to no woman, not even to the Queen Regent, in the degree of her political influence; and whither ambition took her she recked little.

Mme. de Longueville lived to be sixty, but all the action of her day is crowded into the decade 1643-1653, when she was still in the glory of early womanhood. Her life as an episode in public affairs forms a perfect contrast to that of Mme. de Maintenon or to that of Mme. des Ursins. She disappears from politics at thirty-four; they begin at a later age than that of her retirement; and their work had real importance, while her schemes were wholly unfruitful. Mrs. Cock's description of Mme. de Longueville's later years, and particularly of her connection with Port Royal, is good. The repentance of French women in the seventeenth century is a large subject of itself, but we shall not question the sincerity of Mme. de Longueville.

What, it may be asked, does Mrs. Cock say of La Rochefoucauld? As may be inferred from her fondness for Mme. de Longueville, she has a strong dislike of him. We need not take up the question of how far the Duchess permitted her gallantries to extend, but the bare mention of her name beside that of La Rochefoucauld recalls the difference of opinion between Victor Cousin and Sainte-Beuve regarding the lady's character. Mrs. Cock accepts Cousin's attitude entirely, and thus lays herself open to severe attack. Cousin styled himself the "posthumous lover" of Mme. de Longueville, and wrote as such, not as a critical historian. But the affair cannot be adjudicated here. We must say, with Sainte-Beuve, "Laissons donc cette querelle interminable et toujours pendante entre Mme. de Longueville et M. de La Rochefoucauld." Our sole observation is that Mrs. Cock does not give any hint of there being two sides to the quarrel.

The shortcomings which spring from affection can never be condemned with much harshness, and the worst we shall say of Mrs. Cock's book is that it seems too strenuous a defence of Mme. de Longueville. The author ascribes to malicious gossip many stories which we must consider well-founded, and she is over lenient towards Mme. de Longueville's political misdemeanors. Otherwise, this biography is a creditable one, although Condé was not (as it states) a greater soldier than Turenne, and France did not get her natural frontier at the Peace of Westphalia.

Java et ses Habitants. **Par J. Chailley-Bert.** Paris: Armand Colin & Cie.

M. Chailley-Bert is no novice in the study of colonial problems, for he has written with acuteness and learning upon French colonies, and especially on Indo-China, on Dutch officialdom in the Netherland Indies, and on Colonization Companies under the Old Régime. He has also treated special subjects, such as education in and the emigration of women to the French colonies, and upon the British in Hongkong and Burmah. His style is attractive and pleasing, and there is a luminous analysis of the matter contained at the head of each chapter. While his main object in this work is to compare French colonial methods with those of Great Britain and Holland, yet his substance and point of view are valuable to all statesmen and intending colonizers. At the same time one must, in weighing his praise of the Dutch, bear in mind his Dedication, to "le ministre réformateur des colonies Hollandaises," by "his pupil, admirer, and friend."

Part First of his book deals with the native society of Java. Here one secret of the success of the Hollanders is revealed in their practice of the old Roman policy, "Divide and rule." The Javanese do not form a nation. There are three groups of the islanders, each with strongly marked characteristics which isolate them from the other two groups. The Surdanese in the west are economical, agricultural, and religious. The Javanese proper, who are improvident and live only for the day, are most submissive to law. The Madurese are the most refractory to culture and are fiercely independent. There is but little real religion and scarcely any morality. Superstition abounds and is all-powerful. Slowly, but surely, however, the Dutch influence is modifying that of heredity and Orientalism.

There are about fifty thousand Dutch in Java—soldiers, officers, planters, merchants, etc. The planters live tranquilly on their coffee plantations. Every Dutch city is like a large park, with avenues, vegetation, houses, gardens, and abundance of trees. There is great simplicity of manners with much comfort. The chief aim of life with many is to live plainly and gather riches, with a view to spending their later days at home at The Hague. With so many divers factors, native and foreign, each distinct from the other, government is not the most easy thing in the world. There are the Holland domination, the Dutch colonists, the natives, the Eurasians and other mixed races, the Chinese, and the Arabs. No union of any of these races is known, except temporary ones for financial benefit. In separate and brilliant sketches, the author treats of the Japanese, the Arabs, the Chinese, giving more space to the last, because these present a grave "problem," the desired solution of which is to get rid of them.

Tracing the history of the colonial system of the Dutchmen, in which they and the Javanese made a sort of political alliance, the author shows that the government of Java is at basis a protectorate, and that the Dutch protection is applied to every one and to all classes. Especially are the natives protected against the Europeans. There has been great reform of late years in the methods of selecting and training European administrators for the Dutch Indies.

Formerly officeholders were recruited by chance among the elements offered—that is, the Dutch had their system of haphazard and spoils. Now all this is changed; the appointee must know the native institutions, the habits, and the language of the conquered people. The new officers are put at first into subordinate positions, until the local peculiarities of thought, language, and custom are understood. From the lowest to almost the very highest position, the foreign officers are assisted by native functionaries continuously, so that the one class depends upon the other, both working in harmony. This is the whole idea of Dutch administration in Java—to understand the native interests, to respect them, and to reconcile them with those of the Europeans. Above the lower or local officeholders, there is a higher administration of advisers, councillors, and inspectors, and, over all, the Governor-General.

The author treats of the education of the natives, discussing what should be taught, and what pupils should be admitted to the lower and the higher grades. The beginnings of education were with the missionaries, Catholic and Protestant. The East India Company did nothing. Both religionists, ignorant of the native language, taught Latin at first as a common idiom. Then the Protestants broke away from this, and taught the Dutch tongue. Great improvements in methods were made after 1815. After various modifications we have the system of to-day, in which the Dutch officers learn Malay, but the natives are not encouraged to master Dutch. M. Chailley-Bert holds that the consequence of educating the natives is in every country fatal to the suzerainty of the conquerors, because it leads to emancipation. The "duty of civilization" and "the interests of the native people" come into conflict. He tells us what he would do if he were Governor of Java, with power. There should be a plan of study suited in detail to the different classes. He would have technical teaching, arts, and trades for the people, technical administrative training for the sons of the petty nobles, and a liberal education for the sons of the great chiefs; but all of this should be in the home schools, and not in the schools and universities of Europe.

A long chapter in the appendix is very properly given to a description of the Botanical Institute of Buitenzorg, which is a scientific and practical instrumentality, greatly assisting agriculture and carrying high and far the renown of the country. The work has an index.

Orestes A. Brownson's Middle Life. From 1845 to 1855. By Henry F. Brownson. Detroit, Mich.: H. F. Brownson. 1899.

Your convert is apt to be more orthodox than those born to his new-found religion, and Orestes Brownson was not an exception to the rule. Moreover, nothing if not controversial, he at once developed differences with other Roman Catholics, and made them the subject of elaborate discussion in his *Quarterly Review*, which he kept up after his conversion, with much ecclesiastical assistance, mostly financial. He was quite equal to furnishing all the articles himself, and occasionally did so, filling one number with a single article reviewing Theodore Parker's "Discourse of Matters Pertaining to Religion." His first controversy after his conversion to Romanism was with no less a person than Newman, who had made his peace with the Mother Church almost simultaneously with Brownson. The bridge that carried him over was his own "Essay on the Development of Christian Doctrine." It would never do, thought Brownson, to concede that there had been any development of Roman Catholic doctrine. The concession was a plain abandonment of the *semper* part of the *semper, ubique, ab omnibus* claim of the Roman Church. So hard and fast was Brownson in his new belief—the last of many kinds—that he was always suspicious of the English Tractarians. They were too apt to consider the Roman Church the logical outcome of the Anglican, but Brownson would have them know there was no such logical relation between the two. It is easy to imagine what scorn he would have rained upon the recent Anglican claim for the validity of Anglican orders. He insisted that an Anglican was not a Christian, and needed to be converted as much as a Unitarian or Mormon. The scheme of Pius Ninth's dogma of infallibility was originally built, we are told, on the lines of Newman's development theory, but, as so built, was repudiated by Pius, who would have his infallibility as old as St. Peter, the first Bishop of Rome. Another respect in which Brownson found his new friends too easy-going was that of eternal punishment. Nothing but hell for those beyond the Church's pale—such was his creed; and he denounced as namby-pamby the softening of this creed by his Roman Catholic associates.

Brownson was always an ardent politician, and after his conversion his politics were such as to give no offence to his co-religionists. He hailed Webster's 7th of March speech as the greatest of his life, as "rising above mere intellectual greatness and approaching the morally sublime." The son assures us that "no man in this country was more strongly opposed to chattel slavery." In short, "Brownson and Webster were equally opposed to the institution of slavery, and to the Abolitionists' plan for getting rid of it"—not only to the Abolitionists', apparently, but to any other. The Free-Soil party was "a party formed against the common reason, common sense, and common interests of mankind"; "its leaders, almost to a man, infidels and blasphemers." "Mr. Winthrop, the Whig candidate for the Senate, was not a whit sounder than Mr. Sumner, and would have made a far more dangerous Senator." Brownson agreed entirely with Seward and Parker that there was a "higher law" than that of the Constitution, but only the infallible Church could at any time decide what it was; and she "wasn't going to tell."

This biography is not meant to be amusing, but it is extremely so in spots, and especially in those which correspond to Brownson's criticisms on his literary contemporaries. Wordsworth had much to answer for in "the sins of the Brownings, the Barretts, the Tennysons, the Lowells." The elder Dana had over-praised Wordsworth, but he had overthrown "those Boston idols, the utilitarian Edgeworths." Lowell, in general, was severely dealt with, and his "Vision of Sir Launfal" in particular, because of its indifference to sacramental piety. Emerson's 'Poems' of 1847 was pronounced the saddest book Brownson had ever read. "We know these poems; we understand them. They are not sacred chants; they are hymns to the devil. Not God, but Satan, do these praise." Bancroft's 'History of the United States' was found to be another infidel publication, and Hawthorne's 'Scarlet Letter' meets with the sternest condemnation on account of the sympathy which it excites for Hester Prynne. All his old Unitarian friends were made to feel the lash of Brownson's criticisms, at one time or another. It is refreshing to find him criticising Parkman for his skepticism as to the Indian's capacity for civilization. But Trojan and Tyrian were treated by him without much discrimination. The Roman Catholic novelists were far too lax in their theology for his exigent demands. They did not understand or fairly represent their own religion.

There is much interesting correspondence with Brownson's Roman Catholic contemporaries, Montalembert and others. His attitude towards them is so knowing and infallible that he should have lived to be the first Pope under the new infallible régime. When Newman became rector of the Catholic University of Ireland, he invited Brownson to become a professor of—geography! Brownson objected that he was not much of a geographer. A philosophy-of-religion chair was then offered, and Brownson accepted it, but he had given offence to certain Irishmen in America, hence, to others in Ireland; and he advised Newman, for his own comfort and the interests of the University, to bring the negotiation to an end. Newman did so, with some feeble show of disappointment and regret.

The Elementary School Record. University Press of Chicago. 1900.

Esquisse d'un Enseignement basé sur la Psychologie de l'Enfant. Par Paul Lacombe. Paris: Armand Colin & Cie.

Those who take any interest, even the slightest, in lightening and at the same time rendering more effective the task of children in learning all that they need to know in order to become efficient human beings, will study for themselves the account of the work done in the Elementary School of the University of Chicago, as it appears from time to time in the School Record. Professor Dewey seems to have solved to perfection the first problem in education—how to keep the children at a keen point of interest and attention. According to the testimony of all who have seen the school, these children are active and unflagging, and, as a natural consequence, happy the live-long school-day. The psychologists have lately come to the conclusion that the function of childhood is to furnish a time for play—that in play the child performs over and over again, in a simpler form and without any pressing responsibility for having them turn out successful, what will be the serious actions of his future life. We have sadly interfered with the plan of Nature in setting him down at his book and forcing upon him the sad task of plain learning. There seems to be no escape, indeed, from the necessity of cramming into his poor head a vast amount of pure knowledge which will be of service to him in after life, but Professor Dewey has devised a plan for making real work, and a large amount of it, as delightful and as absorbing as purposeless play is to the unthinking.

We have not space here to give the details of the method, but only to mention one feature of it from which the idea of the whole can be gained. The children weave, but not in the babyish, kindergarten way; they are taught to reproduce the processes of weaving (including spinning, carding, etc.) in the various ways in which they were carried out by primitive peoples long ago. Different fibres are studied, and simple plans are devised by the children themselves for working them up into fabrics. It often happens that they reproduce, with more or less exactness, the idea of the earliest inventors. The machines thus thought out (with or without the suggestion of the teacher) are constructed by the children themselves during the manual-training hour, and afterwards they are used in the actual weaving. This is only one instance of the way in which the children are kept at learning by doing, and are led to reproduce in their own school-life the successive stages of activity and of thought of the past ages of man. This, of course, cannot be carried out without something like genius as well as erudition on the part of the teacher, even after its general features have been worked up by the enthusiastic originator of the scheme; and it will be long before its admirable methods will become widespread. Moreover, it will certainly be asked, Has the young generation a right to receive from us such sacrifice of talent and of money as would be involved in carrying it out on any large scale? The children of twelve in Professor Dewey's school keep the school accounts; it is to be surmised that the per capita sums with which they deal are very large. But, aside from that, it is a great thing achieved that the plan has been actually carried out, and with success.

The idea of making children learn only what they are interested in learning has impressed itself strongly at the same time upon a Frenchman, M. Lacombe. The keen wit and cutting satire with which the author lays bare the absurdities of present methods will be a source of intellectual enjoyment to every reader; he will also be easily convinced that something should be done to create a more fitting environment for the helpless child, one in which he is active spontaneously and not from being forced into becoming a receptacle for uncared-for knowledge. But the only plan that M. Lacombe offers in substitute is a little too simple for meeting so grave a difficulty. He would have the children appear in the schoolroom at an appointed time, and the teachers as well. A teacher, or one of the clever boys or girls, starts a topic for discussion, and the eager children ask for more; if they do not, they are left alone in their idleness until another day. But the clever ones are easily interested, and the others are soon led, by suggestion and imitation, to follow in their wake.

It is so extremely desirable that children should be in an active instead of a receptive state of mind during their school years, in a state of spontaneous rather than of forced attention (by which one means a state of attention awakened directly by the subject-matter presented to them, instead of indirectly by rewards, and punishments, and examination marks), that every effort should be welcomed to break down existing methods, especially when the effort is such a brilliant attack upon existing deficiencies as is that of M. Lacombe. It is to be feared, however, that his plan has, besides others, one fundamental and fatal weakness—there is great danger of its introducing an atmosphere of artificiality if not of deceit. The teacher whose first aim it must be to make subjects attractive, is not a teacher in the right frame of mind. Moreover, a certain amount of direct coercion is good for the child at this age. It is a great gain if the child is enabled to work with pleasure in spite of the fact that he also works because he must. For the coercion of real life, which the child is too much of a wild Indian to be able to feel for himself, we must substitute the direct coercion of the teacher.

A History of Modern Philosophy: A Sketch of the History of Philosophy from the Close of the Renaissance to Our Own Day. By Harald Höffding. Translated from the German edition by B. E. Meyer. Macmillan Co. 1900. 2 vols. 8vo, pp. 532, 600.

At the nineteenth century's midday, a doubt used to be entertained whether human powers were adequate to writing the complete history of a great branch of science entirely from primary sources. If the requirement is that the whole matter shall be thoroughly well digested, the feat remains, probably, unaccomplished yet. The larger histories of Modern Philosophy have hitherto belonged to one or other of two varieties. There have been essays, long and heavy, on the leading philosophical tendencies of the successive generations, mentioning none but the supreme productions. These have been too vague and too much colored by their authors' predilections to repay more than a skimming. There have, besides, been set chronicles, one painfully like another, each containing a quasi-bibliography of the subject, with more or less penetrative criticisms of a few writings, adopting current views of the rest, and enumerating a throng of publications with which the compiler's acquaintance seems limited to their names and some guess at their affiliations. These are extremely useful works, but no more entitled to be called histories than a gazetteer to be called a geography. Höffding is the first to furnish Modern Philosophy with a history, in the high sense of the word, an intelligible and interesting chart of the course of the main stream of thought, based upon actual soundings of his own, upon studies minute, critical, and mature. Nor have these been jotted down as in a notebook, but generalized with unusually good literary judgment. If he calls his work a sketch, it must be because only the great questions are touched upon, and because minor writings that he has not himself carefully read and considered are left unmentioned. For in other respects it is no sketch at all, but an elaborately finished work of literature.

The very table of contents promises freshness, especially in dwelling most upon neglected men and movements. The "philosophy of romanticism," as the author rather too wittily (and a little anachronistically) calls German post-Kantian idealism and its accompaniments, is confined to a seventh of the whole space, instead of its regular quarter. Two hundred of the eleven hundred pages go to Positivism, J. S. Mill and Darwin by themselves getting ninety, against the 6, 8, 10, 26, which are the respective proportional allotments of the two combined in four reputable histories of modern philosophy that happen to lie at our hand. A still greater novelty, and a most welcome one, is the allowance of 160 pages to the philosophy of the Renaissance. This is treated under two heads, "The Discovery of Man" and "The New Conception of the World." Thomæus and Cæsalpinus being passed by without mention, which can only be because Höffding has not read them, we come to Pomponazzi, of whose half-dozen books interesting to the historian of philosophy only that one of which there is a modern reprint is noticed. We discover how broad is the author's notion of a history of philosophy when we find eight of his large pages consigned to Macchiavelli, whose 'Discorsi' as well as the 'Principe' have been studied. Althusius is another figure not before introduced into the history of philosophy. "The Discovery of Man" ends with a chapter on Jakob Boehme precisely equal in length to the account of Macchiavelli. Under "The New Conception of the World" we meet only familiar names; but the treatment continues to be original. Of the forty pages occupied with Giordano Bruno not one would be willingly spared by the reader.

It was an excellent idea, after the Renaissance, to appropriate a space equal to that which Bruno fills to Lionardo, Keppler, Galileo, and Bacon. Copernicus had been already treated. For the scientific men, however, the execution is not at the height of the conception. It is no light task, even for an astronomer, in these days, to read Keppler's great book 'De Motu Stellæ Martis' so as fully to appreciate the motive and import of each step of the investigation. Yet no work of special science can be more significant for philosophy, in that no other describes with anything like the same fulness all the steps of a difficult hypothetic reasoning; and, perhaps, man never achieved another reasoning of any kind so elaborate and so triumphant, while its historical influence was of commensurate importance. It cannot be concealed that Höffding has no idea of what the work really was. The chapter on Galileo is not quite so inadequate. The author has evidently run through Galileo's correspondence, and has not contented himself with the famous dialogues. Still he does not begin to do Galileo justice. When one knows next to nothing of the matter except what the celebrated *Giornata Terza* of the 'Discorsi intorno a Due Nuove Scienze' discloses, the founding of the science of dynamics seems such an easy matter! The *ars celare artem* was never carried further. It is requisite to have other reading in order to place one's self where Galileo set out, in that state of mind in which it was considered manifest that when we throw a ball, that which causes it to move on after it leaves the hand can only be the rush of air behind it. It is requisite to have some experience in physical experimentation to appreciate the fineness of those observations of Galileo, made with almost no apparatus, by which he refuted that false notion. It is requisite to be one's self something of an investigator to realize how far he yet stood from his final clear understanding of the matter, even after he had refuted that error, though the little-read 'Sermones de motu gravium' come in to help us here. The whole investigatory procedure of Keppler is laid bare to whoever chooses to peruse it, while we can gather what that of Galileo was only from slight indications. Those are, however, quite sufficient to show that quantitative experimentation played a much greater part in it than the reader of the *Giornata Terza* would gather that it did, Höffding might as well have read nothing else, as far as his conception of Galileo is concerned.

We can notice in this interesting and original work only a few points here and there selected to illustrate its characteristics. Equal space is allotted to Descartes and to Hobbes. Spinoza gets more, as much as Bruno; and Spinoza is pronounced to be *the* thinker of the seventeenth century—high praise considering that the author rates seventeenth-century philosophy as far more accurate and valuable than that of the nineteenth. Newton, with his doctrine that space is a peculiar entity, receives some notice, which is more than he does in most histories of philosophy. But Professor Höffding evidently has no suspicion that Newton's proposition is less purely gratuitous than the opposite notion that position and motion are entirely relative. Hartley is disposed of in two pages. The other father of the association of ideas is mentioned only as "a little-known author called Gay." Rousseau is treated with some respect, and at greater length than either Locke, Berkeley, or Hume. Kant has evidently been studied with the utmost thoroughness; and a good many small points are made which appear to be new. Thus, the suggestion that the 'Kritik der reinen Vernunft' must have been largely a patchwork of detached papers strikes one as happy. Again, in regard to his metaphysical dualism, several passages are cited whose bearing upon this question might easily escape the most attentive student. Yet, after all, Höffding apparently fails to see that the decisive consideration in Kant's mind was no other than that for which, in his second edition, he invented the most prominent situation he could contrive. But it is curious how insensible some men are to this argument, although to others it seems a knock-out. The chapters on the German philosophy of the Hegelian period are the only ones where a little skipping can ever enter the reader's thoughts. But interest is thoroughly roused again when the more recent Germans are reached, especially in the dozen pages about Dühring, whose 'Natürliche Dialektik' is treated with admiration, and much preferred to his later doctrine. Nothing subsequent to 1880 enters into the *cadre* of the work; and much that is previous to that date is too close to us to be accurately sized up. There is not a word about Renouvier, whose principal work was published in the fifties.

The second-hand translation, though authorized, is regrettable. It has been executed by one of those types of German humility who undertake to improve upon our language and rules of style before they know English well enough to avoid effects, now comical, now ungainly, now indecent, now enigmatic, now self-stultifying, now merely silly. He improves a little, however, as the work proceeds; and, besides, the reader becomes inured to his lingo. A book that in another dress would have been a literary treat has, we are bound to warn the reader, thus been rendered somewhat unpleasant reading. The volumes, though large, are comfortable to hold and read. The print is good, the paper particularly so. Each volume is provided with a sufficient index.

The Kinetic Theory of Gases: Elementary Treatise with Mathematical Appendices. By Dr. Oskar Emil Meyer. Translated from the second revised edition by Robert E. Baynes. Longmans, Green & Co. 1899. 8vo, pp. 472.

The kinetical theory of gases is without doubt the great triumph of that corpuscular philosophy which endeavors to explain the universe by turning its splendid tapestry wrong side out, and showing that it is all nothing but bits of matter moving under their attractions and repulsions, according to the three laws of motion. As an ultimate explanation, even of that which it contemplates explaining, the corpuscular doctrine was doomed from the moment when the seed of evolutionism was dropped into the intellectual soil, since it provides no possible way in which the state of things it supposes, the existence of the atoms and their attractions, could have come about—not to speak of its leaving inexplicable the laws of motion, with space and time, the semi-rationality of which things calls loudly for further elucidation. But the spirit of science (which much better deserves the name of philosophy, or pursuit of knowledge, than any cock-sure metaphysical system does) is to adopt provisionally the simplest promising hypothesis—which, in being simple, is necessarily thereby extreme, radical, and skeptical—to follow it out rigidly to its last consequences, and, by carefully comparing these with the phenomena, ascertain what amendments of the hypothesis may be requisite. In the case of the kinetical theory of gases, no positive disagreements of the phenomena with the hypothesis have ever yet been met with; but, on the contrary, each new deduction that the restless activity of the mathematicians brings to light is still found to fit into its place among the facts, as each piece of a boy's dissected map finds its place as soon as he has once begun to fit the pieces rightly together. There is in all science no other theory so interesting in these three respects at once: first, for the logic of the inductive argument, as it has been historically followed out; second, for the subtle deductive reasoning by which the consequences of the hypothesis are, one by one, getting discovered; and third, for the insight it affords into the ways in which different forms of phenomena may arise in nature.

The work of Oskar Emil Meyer has had a great charm for the generation of physicists now beginning to grow old. They were not, for the most part, such accomplished mathematicians as are those who are now taking the stage; and Meyer's plan of dividing his book into two parts, of which the larger called for no more mathematical processes than anybody may perform in his head, while the other set forth deductions in the most elementary way that the subject permitted, suited those men very well. But this is not all. The first division shows how the consequences of the theory compare with observation; and to see one phenomenon after another falling into the ranks of the theory's defenders, as Meyer skilfully, yet simply, shows they do, is mighty pretty and delightful. This division of the work is, from the nature of the case, very nearly a history of the whole course of the investigation; and we do not know what more instructive basis for a course of lectures on the logic of explanatory science could be found than the history of the theory of gases. Whoever cares to see how explanatory research proceeds cannot fail to be interested in this handsome volume. As for the mathematical division, that, too, affords excellent exercises in reasoning, though of a different kind of reasoning, and exercises of quite an opposite character, since this division is infested with subtile fallacies.

To give a single plain example, the author professes to demonstrate that the mere assumption that the molecules of a gas move in broken straight lines suffices by itself to account for Bayle's law that at constant temperature the volume of a gas is inversely proportional to the pressure. Anybody can see that if the molecules are incompressible bullets, this is not so, whether their motion is rectilinear or not, since in that case there is a minimum volume which no pressure, however great, can diminish. Meyer's wrong conclusion arises from his assuming, in his mathematical work, that any infinitesimal volume within the gas is filled with matter in all respects like, and moving like, that in any other such volume; in flagrant conflict with the theory that the gas consists of separate molecules. In the revised edition such fallacies are not so easily found as in the first, but there remains abundance of game for the logical sportsman.

We may remark, by the way, that this translation is much to be preferred to the original, since the additions have been incorporated with the text, and the translator's notes, though infrequent and short, are always pertinent and useful. The English bears some disagreeable traces of being a rendering from German, but they are not very offensive. The non-mathematical division has been brought nearly to date with all the old ability of its author. There are a great number of useful references to memoirs, and, considering how rich the book is, we are inclined to regret that it should not have been made a repertory of all that is really needed to compare the theory with the facts that have been brought to light. But nobody at all acquainted with the subject can fail to remark that much work has either been passed by unmentioned, or too slightly noticed, both on the side of theory and on that of observation. The author's motive evidently was not to fatigue the reader, or choke with dry details the life and movement by which the work is eminently distinguished. There are books, as our readers know to their sorrow, that are neither popular nor scientific, but fall between the two: this one is at once popular, or, at least, very readable, and highly scientific, at the same time; for, though called elementary, it leaves no important feature of the theory untouched, excepting where the theory crosses the border into the domain of liquids.

Among the special points which will be found important for those who are up in the subject, we may mention further argument concerning the author's views of diffusion, a discussion of the effect of dissociation upon viscosity, a theory of the resistance of the air and of the reaction of a jet, and a synthesis of all the evidence concerning the size of molecules.

Naval Yarns of Seafights, etc., from 1616 to 1831. Collected and edited by W. H. Long.

London: Gibbings & Co.; New York: F. P. Harper. 1899.

Many of these quaint sea yarns and nautical notes appear for the first time in a printed form. Most of them seem truthful contemporary pictures of doings at sea and in port; and the battle narratives, though short, will afford data for the historian. Such portions of the collection as exhibit life afloat in the eighteenth century are of especial interest, though of a coarseness not infrequent in literature of the time, especially in relation to the sea.

A description of two sea-fights of the seventeenth century is followed by several pages of quaint directions for carrying on a naval action, taken from the 'Seaman's Grammar' of Captain John Smith, sometime Governor of Virginia and Admiral of New England. These instructions cover the handling of a ship under sail in all the phases of a sea engagement as fought in the middle of the seventeenth century. The midshipmen are directed to see the tops and yards well provided with stones, fire-pots, and "brasse bales," to throw amongst the enemy before "entering" (as boarding a ship was then called). Upon a surrender, you are to "examine them [the enemy] in particular, but always have as much care of their wounded as your owne." Furthermore, young captains were instructed, if either young women or aged men were found on board, "to use them nobly; which is ever the nature of a generous disposition."

The journal of a naval surgeon, though vivid in its description of ship life, is full of the faults referred to as characteristic of the literature of the eighteenth century. On the other hand, the account of the loss of H. M. S. *Phœnix*, commanded by Sir Hyde Parker, written by Lieut. Archer, who was on board at the time, is one of the best descriptions, in every sense, of a shipwreck that can be found in print. The *Phœnix* was lost on the coast of Cuba on the 4th of October, 1780, in a hurricane, and Mr. Archer, the first lieutenant, not only wrote well concerning this affair, but evidently acted in a most gallant and creditable manner both before the wreck occurred and afterwards. Further on in the book we find very interesting phases of life on board an English ship of war at the time of the battle of the Nile, in an account by one of the gunner's crew of the *Goliah*, seventy-four, commanded by Captain Foley, one of Nelson's best commanders.

"My station," says this narrator, "was in the powder magazine, with the gunner. As we entered the bay [Aboukir], we stripped to our trousers, opened our ports, cleared, and every ship we passed gave them a broadside and three cheers. Any information we got was from the boys and women who carried the powder. The women behaved as well as the men, and got a present from the Grand Signior. When the French Admiral's ship blew up, the *Goliah* got such a shake we thought the after-part of her had blown up until the boys told us what it was. . . . I was much indebted to the gunner's wife, who gave her husband and me a drink of wine every now and then, which lessened our fatigue much. There were some of the women wounded, and one woman belonging to Leith died of her wounds and was buried on a small island in the bay. One woman bore a son in the heat of the action; she belonged to Edinburgh."

A DAY IN ANCIENT ROME.

By EDGAR S. SHUMWAY, Ph.D., Professor in Rutgers College. Is in its 2d thousand. Price, cloth, 75c.; paper, 30c.

D. C. HEATH & CO., Publishers, Boston, New York, Chicago.

NEW PUBLICATIONS IN FRENCH.

L'Abbe Constantin

By LUDOVIC HALEVY. English Notes by F. C. de Sumichrast, Assistant Professor of French in Harvard University. 193 pages.

This brilliant story, with its exquisite delineation of character, made a great success when it first appeared in Paris a few years ago, and it is undoubtedly one of the choicest works of modern French fiction.

Complete catalogue on application. For sale by all booksellers, or postpaid on receipt of price by the publisher,

The Nation.

NEW YORK, THURSDAY, AUGUST 2, 1900.

The Week.

Light has at last broken through the fog surrounding Pekin. Dispatches have reached the outer world from the German, British, American, and Japanese embassies, dated as late as July 20, showing that the legations, after having been attacked continuously from June 20 to July 16 inclusive, were at last enjoying a truce, were well provisioned, and the inmates in good bodily condition. A further encouraging detail in the Japanese dispatch is the statement that the German, Russian, American, British, French, and half of the Japanese legations were still standing, and in condition suitable for defence. It is clear, therefore, that the Powers have been premature in assuming that the foreigners in Pekin were all dead, and that nothing could now be done to save them. Incidentally, the confirmatory good news is another vivid illustration of the brutality of yellow journalism. With nothing, apparently, to go upon except rumors and their own imaginings, unscrupulous correspondents in China have filled columns with hideous details of massacre, outrage, and pillage, and of flaming riot and anarchy on every hand. It is a relief to know that much of it is a tissue of lies, but it would be a greater relief if there were any assurance that the same sort of thing would not be repeated at the first opportunity.

The situation of the allies, in view of the actual condition of affairs in China, is certainly a difficult one. Whatever foundation there may be for the persistent reports of disagreement about the choice of a commander-in-chief, there is certainly a growing impatience at the failure of the international army to advance. If the legations at Pekin, with a handful of men and no special preparation for defence, have been able to withstand almost constant attack from thousands of Chinese troops and rioters since the 20th of June, there would seem to be some reason for thinking that the military prowess of the enemy has been overrated, and that a European army, even if not able to reach Pekin, might before this have secured command of the situation. On the other hand, if the foreigners are really being held as hostages, and if, as Li Hung Chang implies, a military advance will seal their fate once for all, the Powers have the hard alternative of pushing an advance which they know means death, perhaps in frightful form, to their imprisoned countrymen, or of making a bargain with the Chinese for their speedy and safe deliverance. Civilized states have an instinctive repugnance to bargains of this sort. Moreover, Li Hung Chang is a wily person, and the whole thing may turn out to be only an adroit game of bluff. If, however, the Chinese are sincere, and can really deliver our foreign representatives at Tientsin or any other place, there would seem to be nothing unreasonable in giving them a chance to do it. There would still be plenty of time to discuss "indemnity" and "satisfaction." It is not, of course, exactly in accord with diplomatic tradition thus to withdraw under fire, while as yet there is no formal state of war; but there are things more valuable than diplomatic tradition.

Admiral Kempff's account of the Taku bombardment shows conclusively that it was an act of war on the part of the allied commanders. For that reason, he very properly declined to take any part in it. Just why the naval officers thought it necessary to seize the Taku forts "temporarily," has never been satisfactorily explained. The correspondent of the *Ostasiatischer Lloyd*, who was on board the German gunboat *Iltis* during the action, says that the allied fleet determined to attack for two reasons. One was that the Chinese were laying mines in the river. The other was that they were strengthening the garrisons. In either case, the Chinese were perfectly within their rights. The English Admiral, however, appears to have thought it necessary to take the forts in order to protect the railway. But the true way to have gone about the matter would have been to demand guarantees from the Chinese commander. If these had been refused, it would have been time enough to talk of warlike measures. As the case stands, the foreigners took the aggressive, and began the war, if war there is. According to the *Ostasiatischer Lloyd's* correspondent, orders came from Pekin, "Kill all Europeans and blow all the ships in the river out of the water." But none of the naval officers has spoken of any such telegram, and it must be regarded as mythical. The standing orders of the Chinese General to resist attack were quite enough to account for his opening fire.

The celebration of amnesty which took place last week in Manila was not distinguished by spontaneous enthusiasm. According to the dispatch of the Associated Press, the people fail to perceive any tangible results from amnesty, and therefore say that they can see no reason for celebrating it. It is conceivable that the news of the killing of eighty-nine of the natives and the bombardment of their town, in revenge for the murder of a soldier, may have had a slightly chilling effect. These untutored savages may not have understood that this chastisement was mercifully intended, and that it really signified that American sovereignty, as President McKinley says, is "the symbol and pledge of peace, justice, law, religious freedom, education, and the security of life and property." Another very untoward circumstance was the prohibition by the Provost of the proposed display of the Filipino flag and of pictures of McKinley and Aguinaldo framed together. Such combinations indicate very rudimentary ideas of the real purpose of our occupation, and show that mistaken views of amnesty are prevalent. For Judge Taft and the members of the Commission to participate in a fiesta marked by such shocking incongruities would have been, of course, impracticable. Such participation would have encouraged the unfortunate delusion which the promoters of the festivity entertained concerning the possibility of independence under American protection. The fiesta is said to be generally considered in Manila to have been premature and unfortunate. Such a view of it appears to be fully justified by the circumstances.

In striking contrast with it is the apparent success of the British in pacifying the disturbed parts of South Africa. The British troops have not, indeed, overtaken President Krüger's railroad capital, nor have they escaped occasional reverses in the field, but they continue to follow up the roving bands of Boers, and to make the guerrilla warfare of less and less consequence, and they have just compelled the surrender of Gen. Prinsloo and 1,000 men. More than that, however, Lord Roberts is contriving to set up efficient civil government in the various places under his control, and paving the way for the contentment and prosperity which it has been foreseen would ultimately follow the British occupation. In the southern part of the Transvaal, as well as in the Orange Free State, this civil conquest is now practically assured, and "pacification" comes near to being an accomplished fact. Evidently, our representatives in the Philippines have something to learn about the business of handling subject races. Lord Roberts has not talked much about either "benevolent assimilation" or the "strong arm of authority," but somehow or other he seems to be attaining the one and using the other with marked success.

It seems strange that the Porto Ricans should hate us, in view of all we have done for them, but if the observations of a *Herald* correspondent are correct, they do hate us, in very truth. It appears that the local magistrates are giving the

Americans a taste of Spanish law, just to show them what it is like when strictly enforced; and the Americans naturally feel that they are being persecuted. In the meantime, the Commission that was to reorganize the courts and revise the laws has not yet left the United States. The enactment of the Porto Rican tariff has been followed by business depression, and many Americans who went into business in the island are reported to be anxious to get out. Taxes are still practically as heavy as under the Spanish régime, while the improved roads, better schools, and better sanitary conditions which the wise application of the revenues has procured, are benefits which the average Porto Rican does not appreciate. The fundamental reasons for this unhappy state of things are not far to seek. As the *Herald* correspondent points out, the Porto Ricans are indignant at the loss of three things for which they had confidently hoped—the extension of the Constitution of the United States to the island, a Territorial form of government, and free trade. In other words, the United States has been guilty of bad faith, and the Porto Ricans realize it; and they are consequently at no pains to conceal their deep dislike of the people who, coming to them in the guise of liberators and friends, turn out to be, from their point of view, very like conquerors and despots.

Neely's Cuban embezzlements are shown to be somewhere between $131,000 and $150,000. The chief part of these frauds consisted in selling "surcharged stamps" that should have been destroyed, and reporting them as actually destroyed. Surcharged stamps were United States postage-stamps bearing the Cuban stamp also, which had been sent to the island for temporary use until regular Cuban stamps could be prepared. In making false reports of the number of surcharged stamps destroyed, Neely had the assistance of Reeves, assistant auditor of the island of Cuba, not a post-office appointee, but who had been designated by Rathbone as a member of the commission to destroy surcharged stamps. Other forms of fraud in which Rathbone, Neely, and Reeves were concerned are detailed by Mr. Bristow, Assistant Postmaster-General, and exhibit much ingenuity. The report is a thorough one, so far as it goes, but it is probable that a trial in court would disclose many new facts. That all these rascals may find their way to the Cuban penitentiary is the ardent hope of all decent people in the United States, and in this we have no doubt that Mr. Charles Emory Smith shares. We hope that he will give us a résumé of the whole affair in *Collier's Weekly* at the proper time.

The race quarrel broke out again *New Orleans last week* with more violence than ever. Nothing like it has been known in this country since the draft riots in New York city in 1863. Then the mob hunted down negroes and burned their houses, as the New Orleans mob is doing to-day. Here an orphan asylum was destroyed; there a school building, the finest negro school in the city. What adds to the horror of the affair, this building was erected with money bequeathed by a negro, who divided his fortune of $600,000 equally between the institutions of both races. The latest outbreak was caused by the desperate resistance to arrest made by the negro, Charles, who had already killed two policemen. When he found that he was surrounded, he of course knew what his fate would be if he surrendered. He would be torn from the officers of the law, and be beaten, cut, shot, and hanged or burned. That he should sell his life dearly was to be expected. It was the natural consequence of the supremacy of mob law. Ferocious punishment makes ferocious criminals, and when a community tolerates lynching, it paves the way for a reign of terror. There will probably be more violence, but even if there is not, race hatred will have been intensified.

Two negroes, charged with assault in Florence County, South Carolina, by some failure of mob justice fell into the hands of the Sheriff. That officer, warned by many recent lessons of the insecurity of jails as refuges, allied with himself the Sheriff of an adjoining county and some forty men belonging to the militia, and undertook to defy the will of the people. Seizing the prisoners, he boarded a railroad train with his party, and contrived by this subterfuge to insult the majesty of the mob. This bold attempt to interrupt the usual course of lynch law was resented by the citizens, and they attempted to capture the audacious Sheriff at several stations, and finally chartered a special train in order to hunt down the fugitives. So hot was the chase that the minions of the law retreated to North Carolina, thereby escaping temporarily from the jurisdiction of the South Carolina mob. Eventually, by circuitous railroad routes, they succeeded in reaching Columbia, S. C., and found an appropriate refuge in the penitentiary. This high-handed interference with the usual course of justice was promptly condemned by the citizens of Florence County. Assembling in mass-meeting, they protested against such an arbitrary subversion of their liberties, and adopted resolutions denouncing the action of the Governor in permitting the removal of the prisoners from Florence County, and demanding their return. To this demand the Governor made the evasive, not to say contumacious, reply, that the prisoners were safer in the penitentiary than they would be in Florence County jail. The proposition is obviously true. Some years ago the Governor surrendered a prisoner to representatives of such a mass-meeting held at Lexington, who pledged the honor of their county that he should be protected. But so soon as they got hold of him they killed him; and when Gov. Tillman complied wih a similar demand, a year or two later, the same result followed.

The excuse for disfranchising the blacks in Mississippi, South Carolina, and Louisiana was that they outnumbered the whites, very largely in the first two States; that they were, as a rule, very ignorant; and that, if they should be allowed to vote, the commonwealth would be ruined. This argument does not seem to apply to a State which has twice as many whites as blacks. But the distribution of the two races in North Carolina is very uneven. The blacks are largely massed in the eastern counties, while there are a number of counties in the west where the population is almost exclusively white. The result is that some sections of North Carolina are as badly off in this respect as the other States. The whites throughout the commonwealth have taken up the cause of their brethren in the "black counties," and the zeal for the disfranchising amendment to be voted on to-day appears to be as strong in the west, where there is no excuse for it, as in the east. The amendment establishes educational and poll-tax tests which ostensibly apply to all alike. But a reading and writing qualification would rule out a host of whites, for the proportion of illiterates is greater in North Carolina than in any other State. To prevent this, another section of the amendment provides that no male person who was entitled to vote anywhere in the Union on the 1st of January, 1867, and no lineal descendant of such persons, shall be denied the right to vote. On the 1st of January, 1867, only a very few negroes anywhere in the United States enjoyed the right to vote, so that this "grandfather clause," as it is called, will let in all the whites, but hardly a single black.

The most curious feature of this campaign is the fact that it arouses scarcely any protest from the Republican party of the North, which is now committed to the policy of letting "the superior race" rule "the inferior" abroad, allowing it only such privileges as may seem prudent and wise. If this is the right rule in the Philippines, who shall say that it is wrong in North Carolina? A touch of grotesqueness is added to the picture by the fact that it is the North Carolinians and South Carolinians and Mississippians and Louisianians and their fellow-sympathizers in the disfranchisement of the blacks at the South who are ostensibly defenders of the political rights of the Filipinos. The history of American politics hardly presents a picture of greater impudence than that of Senator Tillman, fresh from his boasts of the way in which his party had bulldozed the blacks of South Carolina, proclaiming the noble sentiments of the Kansas City platform in favor of justice for another inferior race on the other side of the globe.

Ex-Speaker Reed is not, it appears, on the "black list" of the Republican National Committee, which would be glad to obtain his services for the campaign. But would it not have to make a condition that he recall and recant his epigrams at the expense of McKinley and the party? Would it not be necessary to allow him to speak only to audiences that had never read his gibes about the "Emperor of Expediency," and that had never heard of his famous question to the Republicans in Congress—why they should bother to pass a bill to punish petty larceny in Cuba when they themselves meant to steal the whole island? The National Committee would no doubt be glad enough to employ Mr. Reed's sarcastic tongue against Bryan; but the danger about asking him is that the very application might bring down irony upon their own heads. The ex-Speaker has had too much fun indulging in flings at his old associates to renounce the amusement easily. He knows them so well that he can lay his finger on the raw every time.

Representative Littlefield of Maine takes advantage of the opportunity which was offered him and his fellow-opponents of the Porto Rican tariff by the platform of the Philadelphia Convention. He says that he can find nothing in the platform that commits the party to the idea of Empire or Imperialism, or that justifies the inference that it has any such purpose; "on the contrary, it failed to specifically endorse the Congressional action that could legitimately be held to give rise to that inference." Mr. Littlefield consequently holds that the question of Empire or Imperialism cannot be an issue in the campaign, and he apparently means to rest upon the somewhat evasive platform rather than upon the clear and explicit speech of the candidate when he was notified of his nomination. This may in some latitudes be thought a clever policy.

For the first time the value of the foreign commerce of the United States during a single year exceeds two billions of dollars. It surpasses that of any previous year by $320,000,000, while the exports of manufactured goods have increased over $90,000,000 in value. Their value is returned as $432,000,000, which is almost one-third of the total value of all our exports. So recently as 1895, exports of manufactured goods were less than one-fourth, and in 1885 but one-fifth, of the total. If we go back to 1860, such exports were less than one-tenth of their present amount. In correspondence with the increase of this class of exports, we find a great increase in the imports of what are described as manufacturers' materials. The value of crude articles of this class was last year $302,000,000, while it was in 1899 but $222,000,000; the increase being nearly 40 per cent. In fact, the increase of manufacturers' materials imported is more marked than that of any other branch of our commerce, amounting last year to $107,000,000. Under other conditions than those which now prevail, such commercial returns would at once arouse a demand for a rational tariff. The evidence is conclusive that the manufacturers of this country have fairly engaged in export trade, and that protection against foreign competition can no longer be demanded. Instead of maintaining duties on foreign products, our manufacturers should insist on the abolition of duties on the materials which they import in such prodigious quantities. They could well afford in return to surrender the protective duties on imports of manufactures. Unfortunately, many of our business men are so much absorbed in chasing the rainbow of Oriental traffic as to overlook the certainty of commercial expansion attainable by reforming our own tariff system.

Whether the general election in England takes place this fall or next spring, the Liberal party seems certain to approach it with divided counsels and ineffective leadership. The row the other day about the handful of radical Liberals who openly set Campbell-Bannerman's lead in the Commons at defiance, is but symptomatic of a deep-seated trouble. Even Conservatives of a thoughtful type are bewailing the pitiful estate into which English Liberalism has fallen, as they recognize the advantage, for both their own party and the country, of a stronger Opposition than the next appeal to the country is likely to return. Imperialism and the African war have been as a knife in Liberal vitals. Lord Rosebery is making bids for the leadership on a basis of Liberal Imperialism which he defines as "sane" and moderate; but John Morley and the social-reforming Liberals will have none of it, and vow that they are not able to distinguish one brand of Imperialism from another, the Tory article being every whit as good as the Liberal. If present divisions and heart-burnings continue, what is to become of the old Liberal party? Mr. Morley himself predicted in his latest speech that, if it abandons its principles and breaks up, its place will be taken by the Socialists. He added that, though he had for years fought Socialism within the party, with his back to the wall, if he were ever so unfortunate as to be compelled to "choose between the Socialist and the Militarist with all his random aims, his perversion of the national resources, his disregard for the rights and the feelings of other people, I declare to you that I consider the Socialist's standards are higher and his aims are not any more wild."

The news that rain has fallen generally through the famine-stricken regions of India is encouraging, but Lord George Hamilton, the Indian Secretary, describes the situation as still very gloomy. The expenditures of the Indian Government on account of the famine have been £13,000,000 within the last two years, and the fund set apart for this purpose is almost exhausted. The budget shows that a credit balance last year of £2,870,000 has been converted, by famine expenditure and remission of taxation, into a deficit of £826,000. The Indian Government is prepared to apply £3,000,000 more in famine relief, and it announces that if its own resources prove insufficient, it will appeal to the British exchequer. Lord George Hamilton expressed himself warmly in admiration of the courage and patience displayed by the fifty millions of people who have suffered under this awful scourge. There seems to have been no increase of crime, in spite of the immense loss of property, and this fact should be an additional encouragement to the benevolent to continue their donations. They will be needed as much as ever for months to come.

The loss to Italy through the assassination of King Humbert is incalculable. His unfailing popularity, inherited from his father and increased by himself, was of great value to a country torn by parliamentary strife, while the moderation of his personal expenditure was a constant rebuke to the thievish officials who hang about the Italian Treasury. The last tie with the glories of the *Risorgimento* is sundered, and the new Victor Emmanuel must face the stern realities of a deeply troubled social order. The name of King Humbert, rightly or wrongly, will be associated with disaster to the kingdom of Italy. The oppressive burden of the "Triple Alliance," the humiliation of the Abyssinian campaign, the corruption of Italian officialdom, the crushing weight of ever-increasing taxation, and the consequent growth of Socialism and Anarchy—these are the products of Humbert's reign; they are of his time, if not of his doing; and it appears that the King now has borne vicariously the penalty for the ills of Italy. The assassin, one Bresci, is an Anarchist; he comes from Prato—an industrial town which figured prominently in the "bread riots" three years ago—by way of America.

THE HURT AND HELP OF A THIRD TICKET.

The earnest men who are demanding a Presidential ticket for which they can vote without either fear or shame, are tearfully implored by either party not to do anything to "hurt" it. We do not think they are primarily or seriously concerned over the question whom they are going to hurt. Like the non-resistant Quaker, about to fire at the crouching burglar in his room, they simply announce, "I am going to shoot into that corner, friend, and if thee stays there, thee 'll get hurt." If a resolute stand for right and liberty hurts McKinley, so much the worse for him; if it harms Bryan, that is *his* lookout. Ah, but the cause! Are you against the gold standard? No, Mr. McKinley, we are for it, as we were when you were a wabbling silverite, as we shall be if a gust of popular sentiment again makes you veer to free silver; only, we propose to take our gold standard pure, without the base alloy of extravagance and Imperialism. Then (we are told) Bryan's cause must be yours. Not if he poisons his Anti-Imperialism with a threat to financial and social stability.

But all this, we say, is a minor consideration with the promoters of a third ticket. Their prime object is not to hurt this or that candidate or party, but to help on to something better than either. They wish to help, in the first place, that large body of intelligent and conscientious voters who keenly resent the choice of evils thrust upon them this year by political bosses. Many of these men will not vote at all unless they get a ticket which they can vote without having to hold their handkerchiefs to their noses while they deposit their ballot with a pair of tongs. To them a third ticket is the only road to an exercise of the right of suffrage at all. They have grown weary of weighing feebleness against folly, hypocrisy against recklessness, and making up their minds which, on the whole, is least dangerous, and therefore most worthy of their vote. For once they would like to support a man and a cause that mean strength and truth, and so enthusiasm instead of misgivings.

Let blind partisans make no mistake about the existence of this noble discontent. It is, indeed, to a "discontented class" that a third ticket appeals. It is a class which is discontented at being led by the nose year after year, and compelled to make a nauseating choice of nauseating evils. The country is dotted with such people. Everywhere we see party lines burst through, life-long relationships abandoned, a kind of universal dissatisfaction and break-up. The intelligence of the nation is discontented—that is the true portent of the times. The old hypocrisy of going through a campaign "supporting" a candidate with your eyes shut, asserting that your man is a saint and his rival a devil, has grown too repugnant. That easy division of nominees into the class "hero" and the class "villain" is too farcical this year. The political play is "long" on villains; the stage is full of them. But where is the hero? Well, the third-ticket men are trying to find him.

They also have the growingly vicious conditions of party management in mind, and intend to make the most effective protest within their power against boss impudence. Their watchword they take from Lowell, who, a dozen years ago, pictured prophetically the present crisis: "If parties will not look after their own drainage and ventilation, there must be people who will do it for them, who will cry out without ceasing till their fellow-citizens are aroused to the danger of infection." It is a kind of political sanitary reform in which the Independents are engaged. For many years it has been enough for them to play off their competing Democratic and Republican landlords against each other. The Blaine sewer-gas made them give up their Republican apartments in 1884. They fled from Bryan's leaky roof and choked pipes in 1896. Now both parties have agreed to make no repairs, to leave their plumbing rotten and their walls mouldy, and grinningly ask their Independent tenants, "What are you going to do about it?" The prompt reply is, "We are going to move out into the open air."

Nor will the third ticket be helpful by way of protest alone. Besides raising an alarm, it will appeal strongly to honest men who cherish high political ideals. For one thing, the entire disinterestedness of the movement makes it like a fresh breeze blowing in upon foul vapors. Self-abnegation will be the very note of a movement which necessarily breaks with the sordid theory of politics, and knows nothing of serving a cause for gain. The Latin professor at Harvard used to say, in opening an abstruse elective, "This, gentlemen, is a course which will never, under any circumstances, enable any one who takes it to earn a dollar, or to gratify any worldly ambition." A similar warning is served upon all who are asked to support a third Presidential nomination. They must sign a self-denying ordinance. Gov. Roosevelt's "weaklings" cannot, of course, be expected to do it. But his "strong men" ought to feel their blood stirred within them by this summons to undertake a forlorn hope.

It is purely this ideal principle of the matter that gives the movement its strength. The "practical" sneer is already heard, "What can you possibly accomplish?" Well, all that is proposed can be accomplished. Conscience can be satisfied. The truth can be told. A standard can be raised to which honest men may repair—a political creed promulgated which will not have to be apologized for. "I can see how a man can vote for him, but I do not see how any one can speak for him," our Ambassador to England is reported to have said of Blaine in 1884. It will be something if the Independents nominate a man for whom one can both speak and vote with enthusiasm. The result it is not for them to reckon up. Their true "success" they win before the votes are counted. "Italians!" said Garibaldi to his men, "what have I to offer you? Kingdoms, rewards, victories? I know not if victories, but certainly none of the others. I have to offer you wounds and stripes and death—in the cause of liberty!"

THE POSITION OF THE GOLD DEMOCRATS.

The National Committee of the Gold Democrats, or the National Democratic party, decided on Wednesday of last week at Indianapolis that it was not advisable to nominate candidates for the offices of President and Vice-President. As a delegation from the Plaza Hotel conference of Anti-Imperialists were at Indianapolis at the same time, and as a few members of the National Democratic Committee were themselves Anti-Imperialists of pronounced type, there was a mingling together of the two ideas in the proceedings. It should be borne in mind, however, that conventions called by the Plaza Hotel Committee and by the Anti-Imperialists will meet at Indianapolis in the middle of August.

The National Democratic organization, for it can scarcely be called a party, sprang into existence as a protest. It consisted of men who had acted with the Democratic party when it had the wise and conservative platform of 1892, and who, after being arbitrarily suppressed in the convention of 1896, found themselves with nothing to stand on but the radical and revolutionary platform then adopted. A large number of these men, influenced either by principle or prejudice, could not bring themselves to support any Republican candidate or to endorse any Republican platform. A third ticket was their only resource, if they voted at all; and probably no one who voted for that ticket regrets it. A hundred years from now, one of them has said, we shall have a society composed of the descendants of the men who voted for Palmer and Buckner in 1896; and the future members of that society may be congratulated on an ancestry more intelligent, more conscientious, and more patriotic than any which is now honored by its offspring.

The situation is now very different from what it was four years ago. The Gold Democrats have seen that their protest has been entirely ineffectual to modify the radical creed adopted at Chicago. They separated themselves from the men that had got control of the party organization, and those men propose to keep up the separation. They do not want the Gold Democrats to come back unless they will apologize for their independence and promise submission. On the other hand, the Gold Democrats may feel that their protest succeeded, in so far as it encouraged the Republican leaders to pass a gold-standard act. Many of them therefore feel that their party is *functus officio*. It has wholly and perhaps hopelessly failed to rescue the Democratic party from the Populists who have captured its organization. It has succeeded, partly at least, in establishing an honest currency. It will continue its existence in order to promote the completion of this reform; but it does not seem probable that this end would now be furthered by nominating a candidate for the office of President.

It can hardly be denied that the sound-money issue was that which gave the Gold Democrats their strength; nor that on that issue they are now divided. Some of them believe that free silver coinage is dead beyond hope of resuscitation; others believe that, in view of the abject submission of the Democratic leaders to Mr. Bryan, this danger will never cease until his rule is ended. Some of the former are willing to accept the remainder of the Chicago platform, having convinced themselves that the call for free silver is meaningless; most of the latter probably believe that to vote for McKinley is the only practical way of putting a final quietus to free silver and the Jacobin doctrines together. Under such circumstances, it would have been unwise for the Gold Democrats to nominate a ticket of their own. So many of their number, while agreeing in their devotion to the gold standard, disagree as to its present security as to make it probable that such a ticket would receive very few votes. Such a result would deceive the country as to the real numerical strength of the party.

A crisis has occurred in the history of the Republican party, similar to that which the Democratic party experienced in 1896. What the Republican party originally stood for is known to everybody. It was founded on the revolt of conscientious people against the treatment of the negroes as inferior beings. Its main principle was stated by Lincoln when he said that no man was good enough to rule another without his consent. That principle has been openly repudiated and trampled on by the present Administration. Its platform is just as reactionary as that of the Democrats is radical. Its position has changed since the last election quite as much as that of the Democratic party changed between 1892 and 1896. If there were thousands of Democrats independent enough to organize in revolt against an arbitrary change in party principles in 1896, there ought to be enough Republicans in 1900 to organize a similar revolt against a similar betrayal.

For such an independent movement on the part of Republicans, the action of the Gold Democrats clears the way. The grand old party must be decadent indeed if the worthy citizens who have felt that it contained most of the virtue of the country, are willing to allow themselves to be surpassed in devotion to principle by members of the despised Democracy. We know very well that thousands and thousands of these good people, in New England especially, are ashamed of the attitude of the Administration. Senator Hoar tells us that, after his great anti-Administration speech, letters of approval poured in on him at the rate of five hundred a day. Where are the writers of these letters? What do they propose to do about endorsing the policy of Imperialism? Will they follow Senator Hoar, and aid in carrying out a policy which they regard as cruel, unjust, and pernicious; or will they unite in an expression of their sentiments which will be unmistakable? This question will be answered by the conventions to be held at Indianapolis in the middle of August.

CUBA'S FOREIGN RELATIONS.

It has leaked out from some official source at Washington that the Administration, while taking steps to give to Cuba the independence promised to her, intends to retain control of her foreign relations in the same way that Great Britain controlled those of the Transvaal before the war in South Africa. By the convention of 1881 the South African Republic agreed to make no treaty with any foreign Power except with the assent of her Majesty's Government. Of course the control of the foreign relations of Cuba to this extent would end in complete control, since everything of a diplomatic nature would have to pass through our hands. It would be incumbent on us to see whether anything in the nature of a treaty was involved in any correspondence between Cuba and any foreign Power.

This is not all. The power to control the foreign relations of Cuba leads up to the control of her military and naval resources, if any, and of her coast defences. It points also to supervision over her finances and her power to contract debt. In short, there is very little that a government may do independently if control of her foreign intercourse is surrendered. A plan that has been published in several Western newspapers as coming from official sources in Washington, embraces the following points:

> "(1.) The foreign relations of Cuba to be managed through the American Government at Washington.
>
> "(2.) Cuba to have no power to declare war without the consent of the United States.
>
> "(3.) The United States Government to have a veto power over legislation increasing the Cuban debt beyond certain limits to be set forth in the new Constitution.
>
> "(4.) The United States to have a certain well-defined supervision over the Cuban Treasury.
>
> "(5.) The United States to retain for a period of years, if not indefinitely, control of the fortifications which command the port of Havana and other important cities of the republic."

This plan is evidently put forth as a feeler, to test public opinion. It is part of a plan not to release our hold upon Cuba—not to fulfil the promise we made when we declared war against Spain—not to carry out the platform of the Republican party adopted six weeks ago at Philadelphia. As the Chicago *Times-Herald* says, it is "Cuban independence with a string to it." The question whether we are to keep our word in this particular or not is therefore likely to enter somewhat into the campaign, and become part and parcel of the general problem of Imperialism. It is doubtful, however, whether we shall find anybody in authority willing to stand sponsor for a plan to annul our solemn obligations so soon.

It is true that some politicians of note have publicly declared that the promises we made in regard to Cuban independence were sentimental and silly and ought not to be regarded now; but the nation is not of that opinion, or not yet. It is sometimes said by men who approve of our holding the Philippines, that Cuba would be of much more value to us than those distant and half-civilized possessions, but that we must keep faith and give her the independence we promised, and trust to annexation coming in the natural way, as the result of gratitude, friendly intercourse, and trade. This, we think, represents the most influential part of public opinion in the United States to-day. At all events, the number of those who avow any different purpose or desire is very small.

Control of the foreign relations of Cuba would be simply an entering wedge for control of everything, and it is well to inquire whether there is any greater reason for our controlling her foreign relations than those of any other American country, as Mexico, for example. Seventy-two years have passed since the Monroe Doctrine was proclaimed, and it has answered every purpose of restraining foreign nations from extending their power or acquiring new possessions in the American hemisphere. It has never been necessary for us to curtail the treaty-making power of any country on this side of the ocean. In fact, we never thought of doing such a thing. Not even in the case of Santo Domingo, or of the smallest republic of Central America, did it ever flit through our dreams that we ought to usurp or even seek to control their foreign relations. There were good reasons why we should not do so. Control of their foreign intercourse would make us responsible, more or less, for their behavior toward foreign Powers, and this might prove, in the case of peoples of hot temper and revolutionary instincts, burdensome in a high degree. It has been our interest not to relieve them of responsibility for their own acts. Ought we to relieve Cuba from hers?

Unless we are prepared to take Cuba, for better, for worse, and for ever, we ought to take no portion of her duties and responsibilities. What we promised her was independence, not suzerainty. It was proclaimed to the world by Congress and President in these words:

> "That the people of the island of Cuba are, and of right ought to be, free and independent.
>
> "That the United States hereby disclaims any disposition or intention to exercise sovereignty, jurisdiction, or control over said island, except for the pacification thereof; and asserts its determination, when that is accomplished, to leave the government and control of the island to its people."

This promise was reiterated in the Philadelphia platform, which declared that the pledge so made should be fulfilled "to the letter." A reservation of control of Cuba's foreign relations was not made or thought of at the time when Congress passed these resolutions, nor when the Republican party adopted its platform. There is no avowable reason why it should be made now.

THE WHITE PERIL.

Whatever the exact form of words used by Emperor William in his latest harangue to the troops, both the official and unofficial reports reveal him as threatening the Chinese with bloody vengeance. He may not have bidden his men give no quarter, but he certainly did urge them to make the German name a scourge and terror in China. If not in violation of the laws of civilized warfare, at any rate under their cloak, the German army was to inflict such cruel reprisals that the memory of them should not perish for a thousand years. In other words, the Emperor proposes to meet barbarism with barbarism, to beat the Chinese at their own game.

We might pause to ask if this is not one more proof of the effect of militarism in coarsening the German character during the past century. The Kaiser's truculent speech marks for us the contrast between the Germany of Goethe and Schiller and Herder and Kant, and that of Hartmann and Nietzsche and Nordau. William's barbarous utterances are naked and unashamed; the great Frederick could be brutal, but his was at least a *barbarisme de bon goût*, like that of the Bourgeois Gentilhomme. But we do not press the point. If Germany has deteriorated in moral tone, she has done so only in company with all Europe. There seems to be no doubt that Lord Salisbury and M. Delcassé have made threats almost as dire as William's. They have informed the Chinese Ministers to England and France that those civilized and Christian nations will demand life for life, apply the *lex talionis* as vindictively as any savage, and for every envoy killed in Pekin hang two viceroys and all the Tsung-li-Yamen.

This is the great danger of the situation—that the allied Powers will be tempted to a vendetta in China. We have heard much of the Yellow Peril. Here is the White Peril. Civilization undoubtedly has a stern and terrible task before it in China. But let it not mistake the temper in which it must be executed. We cannot compete with the Chinese in cruelties. Just see what is implied in the German Emperor's threat to outdo the Chinese in exacting vengeful reparation. It is that the "resources of civilization" are to be employed for barbarous ends. The Chinese are adepts in refinement of cruelty. Killing they will not mind. A thousand heads might fall for every Christian massacred, and China would think nothing of it. So if the Kaiser's wild words mean anything, they mean that our superior knowledge must be drawn on to rack the nerves in exquisite tortures more fiendish than anything the Chinese ever dreamed of. This is what we come to if we merely set about terrifying China. We put ourselves on the level and fight with the weapons of the barbarians against whose enormities we cry to Heaven!

The peril is, in short, lest civilization renounce itself, lest Christianity deny itself. The Empress-Dowager has trampled upon the precepts of Confucius; why should we be bound by the commands and sanctions of our religion? That is the question which it is so easy for the brute in us to put. Civilization, we must remember, is for ever a running fight with the ape and tiger that lurk in man. The civilized man is, in essence, in native passions, the same as the savage man; only he has learned to restrain himself, to yield to the motives that make for social peace and civic stability. But the savage instincts are there. Every sage ruler knows it, dreads the mob, fears the breaking loose of the chained dog. To appeal publicly to the motives of the red Indian is the hugest blunder of which modern statecraft could be guilty. The German Emperor has come very near making it. At the moment when the civilized Powers should be thinking only of justice, of the sole cause (that of right and truth) in which it is ever lawful to "broach the blood o' the world," he clamors for vengeance as would an Apache chief.

This recrudescence of barbarism is suspiciously connected with the great colonizing movement of the end of the century. In its early years we harried the coasts and penetrated into the interior of Africa in search of slaves. It was the persons of the natives we desired; now we boast ourselves that all we want is their lands and goods. In the last analysis, the difference is not so great. Greed was at the bottom of the slave-trade; and it is unquestionably at the bottom of much of our colonization in the name of humanity. A recent letter from the French Congo declares that Europeans, in their haste to become rich through exploiting the natives, are causing discontent everywhere, which promises to lead speedily to a sanguinary outbreak. That is, in little, the way in which the new-fangled mode of spreading civilization means stirring up strife and shedding blood. Dr. Johnson said that men were seldom so innocently employed as when engaged in making money. But this can be true of nations only when their money-making trade is not blood-stained. Commerce with uncivilized nations, relentlessly pursued without regard to the rights or wishes of other peoples, is only a new form of slave-trade. As we see, it rouses savage passions, which are dormant, not dead. China is in great danger, no doubt; but the civilization confronting it is in peril almost as acute, viz., lest, in shattering the power and breaking the pride of the Chinese Empire, we allow the barbarians really to triumph over us by making us as barbarous as themselves.

THE MYCENÆAN HOUSE OF THE DOUBLE-AXE.

OXFORD, July, 1900.

Since the days of Dr. Schliemann's discoveries, nothing has made an epoch in European archæology in the sense attaching to those words when used of the revelations for which we have to thank the indomitable energy and unflagging enthusiasm of our compatriot by adoption. But now, since Mr. A. J. Evans has returned from his last archæological campaign in Crete, we are fairly entitled to say that a new era has dawned upon us, and that the blank spaces in the earliest records of European letters and arts are soon to be filled up by an array of new facts.

Six years ago, Mr. Evans discovered in Crete a system, or, rather, two systems, of writing older than that of historic Greece, and distinct from the Phœnician, as well as from the so-called "Hittite" of Asia Minor. The characters of this script he found on seal-stones, and, finally, about two years ago, on a steatite libation table unearthed in the Dictean cave of Zeus. This last was demonstrably of the Mycenæan period. Naturally our investigator's thoughts turned to Cnossos, "the city of Minos and Dædalus," and the "traditional centre of early Cretan civilization." Indeed, as early as 1894, he copied linear characters from a Cnossian seal-stone, and obtained further indications from that site, which confirmed him in a wish to make systematic excavations there. Mr. Stillman had attempted to dig on the site, attracted by the presence of Mycenæan pottery, and by curious signs upon stone blocks showing on the hill of Cephala, near the modern town of Candia. Dr. Schliemann also had striven to secure the right to excavate the site. But all efforts were defeated by the impossibility of coming to terms figure, identified by two white feet and the hem of a highly variegated robe. Among the marching youths here and there are heavily draped figures of men and occasionally a woman. These were plainly magnates decked out in full festal attire.

It is not, however, in these ceremonial robes and magnificent personages that our interest centres. The tribute-bearing youths, especially, of course, the one marvellous figure among them which is preserved almost entire, come to us, out of the dark backward and abysm of time, clothed in a youthful brightness and perfection of manly beauty which far outshine the known perfections of Mycenæan art as elsewhere unearthed. Looking at these youths, we feel that the perfected art of vase-painting in the red-figured style of the fifth century B. C. was, after all, no new departure, but a revival. And yet the one youth's face, seen in profile, that has been unearthed is by no means definitely of the generalized Greek type—it is far more individual. We seem to have before us, united in the prehistoric perfections of early Cretan art, the realistic style of the earliest Egyptian dynasties (*cf.* the well-known statuette of the scribe in the Louvre), and the idealizing manner of the sculptors and vase-painters who preceded Phidias.

That the Labyrinth might not lack its bull, there was, at the end of one of these processional paintings, a painted bull. This painting covers three independently frescoed surfaces, upon each of which in its day had stood the picture of a bull. Nor were other representations of bulls lacking in this, the Minotaur's lair. The head of a bull and parts of its body, the whole modelled with consummate skill in high relief and wonderfully painted larger than life, has been unearthed on this site. Wonderful as the technique of the bulls on the Vapheio cup undoubtedly is, this Cnossian bull is of even finer workmanship. To proceed from the colossal to the minute, let us here mention a curious piece of crystal, found also by Mr. Evans, which bears upon it the enamelled miniature of a bull. Here, again, the technique is marvellous, and the glittering intensity of life which looks out through the bull's eye from this miniature has the speaking power of the wonderful donkey's eye that looks out from behind Watteau's well-known "Pierrot" in the Louvre.

Even yet we have not done with the frescoes discovered by Mr. Evans in the palace of Minos, for the greatest surprise of all in many ways is the discovery of another group of wall-paintings, the remains of which are unfortunately almost pulverized. These fragments have been ingeniously pieced together, and even more may be made out of them by further industry and skill. Their scale is as small as that of the tribute-bearing procession is large. They are miniatures executed in a very sketchy style, but with a freedom of hand and an eye for the attitudes of aristocratic ease and graceful *savoir-faire* which are simply amazing. The chief interest here centres in groups of extremely well-dressed ladies, belonging, it would seem, to the most exclusive circles of a highly organized social world. They are swiftly sketched in on a white background, and are sitting in the open air. One of them has seated herself near the horn and pillar of a temple, the counterpart of which may be found on various Mycenæan seal-rings. All of them are *décolletées* to an extent which prompts a hope that traces of some sort of a gossamer fichu may eventually be made out. Their attire is otherwise most elegant, and the curled tresses of their coiffures form a pleasing feature in their picturesque silhouettes. Far more sketchy are the groups of men similarly sketched in black on a reddish background. These are for the most part merely the outlines of various male profiles. The effect of a crowd achieved in all these groups is quite unique.

Space is lacking for discussing the rich and various vases, jars, lamps, and the like which Mr. Evans found in several corners of the great palace. And I can say but a word of the vast accumulations of inscribed clay tablets which form a part of the new discoveries that has a universal importance. Of these Mr. Evans has spoken in detailed letters to the *Athenæum* of May 19 and June 23, 1900. The tables are "oblong slips of hand-moulded clay, flat on the engraved sides, with almost adzelike ends, but thickening towards the centre of the back." They vary in length from about two to upwards of seven inches. They were found in receptacles of wood or clay, and the clay seals with which they were secured have been found. These seals still bear the impressions of engraved Mycenæan gems, and in many cases have been carefully countersigned (presumably by some superior officer) both on the front and the back. It seems tolerably sure that a large portion of them relate to palace accounts. One set plainly refers to chariots, and on another group are discovered pictorial representations of Mycenæan vases and the like. Numbers, of course, abound on these inventories.

As to the characters of the script, several of them are identical with linear forms found on Cretan seals of the same period. Affinities with the Cypriote syllabary and with Lycian and Carian characters are not lacking. Let it be understood that the above description applies solely to the first 1,000-odd inscriptions discovered at Cnossos, and that the numerous characters thus discovered (sixty-seven have been so far distinguished by Mr. Evans) chiefly resemble one of the systems previously discovered in Crete and the Aegean in being linear rather than pictorial. The execution of these Cnossian linear inscriptions shows a firmness of touch and deftness of hand not achieved elsewhere. Their general aspect has the beauty of archaic Greek inscriptions, and is palpably not of Babylonian, Egyptian, Hittite, or Phœnician inspiration. Here, as Mr. Evans says, we have "the work on Cretan soil of an Aegean people."

Quite apart from these linear characters are the pictographic inscriptions found last of all by Mr. Evans in one of the "magazines" of the Labyrinth. The clay tablets here found are inscribed with a "hieroglyphic" type of writing identical with the pictographic characters long since published by Mr. Evans from various prism seal-stones of eastern Crete. This system is more or less obviously allied to Egyptian hieroglyphics, although it embraces not a few linear forms. It is probably pre-Mycenæan, and plainly was at home among the Eteocretes of the region of Mount Dicte.

LOUIS DYER.

THE PARIS EXPOSITION.—V.

THE AMERICAN SECTION.

With that absurd building standing to our discredit on the banks of the Seine, it is a pleasure to find the American the most interesting of the foreign sections in the Grand Palais des Beaux-Arts. I have said that the French have spared to all other countries only the same amount of space reserved for their own Decennial Collection. Even under these conditions, they have been more generous to Italy and Spain, whose painters can barely fill the rooms allotted to them, than to the United States. But, in a way, what at first seems so unfair has proved an advantage. There is too much in the French section; you cannot see it all, nor, for that matter, do you want to see it all. Acres of the usual Salon commonplace must be waded through before you come to the few pictures of importance, either in themselves or in the history of the last decade. But in the United States section small room is left for commonplace. The difficulty has been to fit in the work of men really distinguished or prominent. Fortunately the committee realized that, at whatever cost of heart-burning for others and criticism for themselves, only the best should be exhibited. Several other things have crept in—no committee is beyond reproach. Several omissions might be noted. Where, for instance, are Mr. McLure Hamilton, Mr. Dewing, Mr. Frank Mura? Where Miss Mary Cassatt? Where Mr. Duveneck, Mr. Elihu Vedder? Nor is there an endeavor to bring forward younger men so as to make new reputations. But, on the whole, the poor work is rare, the omissions are not many, and it is the object of an exhibition of this kind to record the past, not to predict the future. Besides, the mistake of the British committee in overloading their walls with numbers, bad work, and dead reputations, has been avoided. It is better to show a few good things than a patchwork of any sort of pictures reaching from floor to ceiling.

The hanging is excellent; each painting treated with due respect and given the necessary margin. The cool neutral green of the background is admirable for the purpose, and refreshing after the red walls of the English and French galleries. There are only two faults. One is that an extra room down stairs—put at the service of the committee at the last moment, one would say, from the look of it—has been used as a sort of rubbish heap; the other, that the balcony has been turned to so little account. In almost all the other sections, additional wall space has been gained by building up small galleries on this balcony. But the American prints, drawings, and architecture are crowded into a corner that almost any one of the exhibitors could have covered had he had the chance to do himself justice. However, the arrangement, on the whole, is so excellent that these faults can be the more readily forgotten.

I confess I came to the American section prejudiced. That is, I was more curious to see it, more interested in it, than any other. I know the work of American artists who live in London and Paris, who exhibit, year after year, in the Academy and the two Salons, and who, in their art, are usually as French as the native-born Frenchman. The work of American artists who stay at home I know less well, and yet race; and the beautiful "Virgin Enthroned," by Mr. Abbott Thayer. This last, probably familiar enough in New York, I see now for the first time, and I cannot help noting, as I am sure has been noted many times already, the dignity of the composition, suggested by the early Italian and Flemish Madonnas, and the independence with which Mr. Thayer, adapting to it his modern method, has steered clear of the sensationalism of Jean Béraud at the one extreme, of the prosaic literal affectation of Van Uhde at the other. He has not been affected by the passing fashion for the religious picture. Love of beauty has been his inspiration, and so well has he succeeded that the little child, wholly modern and American, kneeling to the right of the Virgin, against the vague blue background, is as lovely as the angels of Bellini. It would have been strange had a gold medal been refused.

These pictures, however, represent the interests and tendencies of individual painters. It is another matter with the landscapes, which, whether the artists are conscious of it or not—and I do not think attention has been called to the fact—represent a distinct school of American landscapes, purely and entirely American. I should say that these painters are distinguished chiefly by their desire to render the aspect of the landscape before them, or their impression of it, as truly as Monet and his followers, but with a beauty that shall not be lost, as too often happens in the present dealer-boomed, made-and-sold-while-you-wait phase of so-called impressionism. The painters of the American group never forget this beauty in the study of the vibration of light, the quality of color under varying atmospheric conditions, the division and subdivision of tones into streaks of paint, or any other problem, however absorbing in itself. Let it be understood that I have no objection to impressionism. It simply means the work of men of strong individuality, and, therefore, great men; and among them, some day, may be found the name of Claude Monet. But that is no reason why his every study, his every unsuccessful experiment, should be accepted as a work of genius. As the American landscape painters seek their motives in a country as different in character and atmospheric effects as well can be from that of the masters of the Continental schools, they have been forced to cultivate their powers of observation, and to see and experiment for themselves.

It is not an exaggeration to say that, from one end of the Exposition to the other, I found no painter who seemed so legitimate a descendant of Corot and the Barbizonians as Inness, though in method and style so entirely unlike them. His love for beauty is as evident as theirs, but his originality is no less remarkable. They never would have ventured upon so gay a scheme as his "Sunny Autumn Day," with the gold and red of the foliage repeated in the gold and red of the flowers below; the austerity of French landscape would have been against it. But they were never more graceful in their tree forms or lovelier in the lines of their composition. The picture has the dignity, the serenity of a fine Corot, with a quality as strikingly individual, and a color scheme not any other painter I know of has succeeded in carrying out. It is interesting to compare it with a landscape by Mr. East in the adjoining English rooms, an attempt to produce the same harmony of gold and red; but Mr. East's picture is nothing more than a mosaic of hot color, while Inness's brilliant autumn tints are softened and fused and harmonized in the radiant October sunlight. There is no question that he holds a place among the greatest masters of landscape.

Wyant I do not think strikes as individual a note. He is more nearly akin to the French Romanticists, at least as I see him in the Exposition, with his solemn "Sunlit Valley" winding between low hills, the lofty arch of the trees "In the Adirondacks," opening to show the vista of delicate green beyond and the fine gray moonlight. I do not know more of his work; I can speak of it only as it now appears to me. Two charming little pastorals, by Mr. Dessar, show something of the influence of Millet. In the stately "Brooklyn Bridge," by Mr. Ranger, I should say the development of a new and amusing convention rather than strict accuracy was his object: I doubt if the bridge ever looked like that, but I doubt, too, if a more faithful report would have produced such an effect of height and size. There is more of convention than of Nature again in certain men like Mr. Gihon and Mr. Dearth. Then, one or two others—Mrs. Macmonnies, in her brilliant "Lilies and Roses," Theodore Robinson, Mr. Benson—have come largely under the spell of Monet; one or two, like Mr. Parrish, seem to have been caught and badly entangled in the so-called decorative movement of the day. But they are the exceptions. The larger number of landscape painters are as individual, as American, as Inness.

Nowhere is this more marked than in the numerous studies of snow and snow-effects; Mr. Childe Hassam's wonderfully true Fifth Avenue, on a white winter day; Mr. Platt's low hills under their covering of snow; Mr. Needham's cold frozen park, with the few figures to mark its whiteness, and the sunlight falling on the buildings beyond; Mr. Alden Weir's ice-cutters among the brown trees; Mr. Coffin's daring and surprisingly successful attempt to give the lurid splendor of the red-streaked sky at sunrise on a snowy morning; Mr. Palmer's little red house, where a Senator was born, stranded in snowy wastes; the wintry pictures of Mr. Taber, Mr. Ochtman, Mr. Nettleton, Mr. Eaton. There are few things more difficult to paint than snow. James Maris, M. Thaulow, and M. Monet are almost the only Europeans I know of who have managed to suggest both its truth and its beauty. And here you come upon a large group of painters who have approached the subject fearlessly, and rendered its loveliness, under many aspects, more perfectly than it has ever been done before, and without any reference to European work. And the same success marks the other landscapes, in which the motive, as a rule, is the simplest, as if to emphasize the fact that the magic is in light, in atmosphere: Mr. Chase's wide stretch of empty country, with the gleam of the sea beyond—though Mr. Chase shows his European training and is much less American, less individual, than many; Mr. Homer Martin's wooded hills bathed in blue mist; Mr. Bruce Crane's lovely little white house; Mr. Davis's quiet summer evening; Mr. Redfield's desolate road; the landscapes of Mr. Meakin, Mr. Metcalf, Mr. Francis Murphy. There is always evidence of something seen, something observed, something felt. And so it is with Mr. Winslow Homer's fantastic dance by the sea, his man on the lookout, gray in the blue night, his "Coast of Maine" with the great waves rolling in; he has seen these things for himself, though, perhaps, not as pictures. In a word, it is the genuineness of the land- and sea-scapes that impresses one. They are the work of men who have learned all the schools can teach technically, but are not hampered by tradition nor bound by convention; men who are alive to the fact that a picture, though true, may be a thing of beauty; and this, of course, was exactly the stand of the Romanticists, of Mr. Whistler when he painted his nocturnes. They do not strive after technical eccentricity, they make no attempt at classicism, at what is called impressionism, or any other ism, except Americanism. There is no doubt that the exhibition proves absolutely that we have a genuine school of American landscape.

Their pictures do not exhaust the excellence of the collection. I have said nothing of Mr. Muhrman's stately, impressive designs, which do not, however, tell as they should; Mr. Mark Fisher's "Drove of Swine," a regrettable choice, since it does him scant justice; Mr. Hitchcock's Dutch gardens; Mr. Swain Gifford's little green landscape; Mr. Church's fantasy; Mr. Bunce's Venetian waters; R. Blum's Japanese markets; Mr. La Farge's South Sea notes; Mr. Johnston's Summer Night Idyl; Mr. Fromuth's boats. I have said nothing of the pictures of Mr. Harrison, Mr. Gay, Mr. Bisbing, Mr. Kendall, Mr. Bridgman, Mr. Weeks, Mr. Ridgway Knight, Miss Elizabeth Nourse, that carry the stamp of the Salons with them. But it seems to me that whatever is freshest in the art of America comes from the men who have stayed at home and ignored Salons, and made a movement of their own. I do not want it to be thought for a minute that great artists like Mr. Whistler are to be dismissed by this summing up. There are several American artists in Europe who, deservedly, are recognized as the masters of American art. But it is especially interesting to see a new phase of that art, which has never been properly represented in Europe before.

The American artist has distinguished himself no less in his sculpture, drawings, prints, and miniatures. But of all this work I must wait to write until I can give it the necessary space. N. N.

THE MUTINY OF THE "BOUNTY."

DUBLIN, July 11, 1900.

Sixty years ago, children had, more than now, to be content with oft-told tales. Many that then held us enthralled have now almost faded from general consciousness. Amongst them is that of the mutiny of the *Bounty* and of Pitcairn's Island, upon the first chapter of which Byron founded his poem of "The Island." We wonder how many young fellows have by its perusal been sent to sea in the expectation of visiting the South Sea Islands. Many passages still haunt our memory:

> "The morning watch was come; the vessel lay
> Her course, and gently made her liquid way;
> The cloven billow flashed from off her prow
> In furrows formed by that majestic plough;
> The waters with their world were all before;
> Behind, the South Sea's many an islet shore."

Or, further on in the poem:

> " 'Huzza! for Otaheite' was the cry,
> As stately swept the gallant vessel by.
> The breeze springs up; the lately flapping sail
> Extends its arch before the growing gale;
> In swifter ripples stream aside the seas,
> Which her bold bow flings off with dashing ease."

The recent republication in New York (by M. F. Mansfield), without note or comment, of Lieutenant Bligh's 'Narrative of the Mutiny' (an excerpt from the account of his whole voyage) renders it opportune, if only in justice to the memory of the Mutineers, now to repeat the chief points of the story.*

Tahiti had been discovered by Wallis in 1763, and was subsequently visited by Captain Cook. The possible capabilities of the breadfruit as a food for slaves attracted the notice of the British West Indian planters. At their instance, the Admiralty in 1787 decided to transport a cargo of plants from Tahiti. The *Bounty*, a full-rigged ship of 215 tons, was selected. It was put under the command of Lieut. William Bligh, aged thirty-four, who had accompanied Cook on one of his voyages. Second in command was Fletcher Christian, aged twenty-four. He was of good family. His brother Edward became professor of law at Cambridge, and well known as editor of 'Blackstone's Commentaries.' The *Bounty* sailed in December, 1787, reached Tahiti in October, 1788, took in her cargo, and left for the West Indies in April, 1789. Bligh had from the first shown himself to the last degree irritable, suspicious, and passionate. The crew had been on short allowance since within a fortnight of leaving England. He was not even on speaking terms with his officers; they had come to take their meals separately. Affairs culminated three weeks after they had left Tahiti. Bligh accused officers and men of stealing his cocoanuts. "I hope you do not think me so mean," exclaimed Christian. The appellatives "—— hound," "thief," and threats to flog and make him jump overboard, were Bligh's rejoinder. That night, brooding over his wrongs, Christian upon the moment conceived the idea of seizing the ship. The watch on deck gladly seconded him. Bligh and those likely to be his friends were secured in their hammocks, a boat was lowered, and they, with a scanty supply of water and provisions, were hurried into it. In reply to Bligh's protestations and appeals, Christian said it was then too late. "I have been in hell this fortnight past, and am determined to bear it no longer. You know that during the whole voyage I have been treated like a dog." He handed his own sextant and nautical tables to Bligh. Bligh's navigation of the twenty-three-foot boat, with eighteen officers and men, loaded at first to within eight inches of the gunwale, 3,600 miles, to the Dutch settlement of Timor, is a thrilling story of the sea. Twelve of the party, by different routes, lived to reach England. Bligh was afterward appointed Governor of New South Wales. His conduct was so arbitrary and outrageous that the settlement rose against him, imprisoned him, and sent him home. He was appointed an Admiral in 1811 and died in 1817.

As Bligh's better qualities were, in the perils of the boat voyage, fully shown, so were those of Christian, the wave of passion over. He clearly recognized and accepted the irrevocable consequences of the step he and his had taken. To the last he appears to have conserved the respect of those—at first twenty-five, all told—who had thrown in their lot with him or whom he had detained. They reached Tahiti again in June, took on board a party of natives, sailed for the neighboring island of Tibouai, and there set about the construction of a fort. Contests ensued with the natives. They returned to Tahiti. Sixteen of the mutineers decided to sojourn there, while Christian and eight others, accompanied by a number of Tahitian men and women, sought some refuge in the *Bounty*. As he embarked on the 17th of September, 1789, he advised those who remained, in best chance for their lives, at once to deliver themselves up to the British vessel which, if Bligh and his crew reached civilization, would certainly be sent in search of them. He alone was responsible for the mutiny. He exonerated all, even his adherents, from so much as suggesting it. He begged young Heywood, a midshipman, who was fully clear, should he reach England, to communicate to his (Christian's) family all the circumstances of the case "which might extenuate, though they could not justify, the crime he had committed against the laws of his country."

The *Pandora* frigate appeared off Tahiti in March, 1791. Two of the mutineers on the island had been killed. The fourteen survivors gave themselves up or were taken. The partings between many of them and the native female connections they had formed were heartrending. On the *Pandora* they were treated with barbarous severity. The frigate cruised for some weeks in the neighboring seas in vain search for any trace of the *Bounty*, and then left for England. She was wrecked upon a reef in Endeavour Strait, thirty of her crew and four of the mutineers perishing. The voyage of the ninety-nine survivors in three open boats, 1,400 miles to Timor, was another thrilling passage in the general tragedy. Of the ten mutineers who reached England, four years after their departure, and were tried by court-martial, three were acquitted, two were executed, one imprisoned, and the others, although found guilty, were so patently innocent that they were pardoned. Among these last was Midshipman Heywood, who afterward rose to distinction as a commander in the navy.

Nineteen years passed from the day on which the *Bounty* sank below the horizon of Tahiti before the mystery which hung over the fate of those who sailed in her was revealed. In September, 1808, the *Topaz*, a United States vessel, sighted an unknown rocky island in the South Pacific, and, short of water, sailed close in. The shore, upon which a tremendous surf was breaking, appeared inaccessible. The cliffs were crowned with luxuriant vegetation. Smoke, showing habitation, was perceived, and a canoe was presently seen approaching, manned by a dusky crew, who hailed the ship in English. The captain went ashore, and what was his astonishment to be greeted by a white man, calling himself John Adams, who stated that he was the last survivor of those who had stood by the *Bounty*, and that his thirty-four companions were Tahitian widows, or the widows of the Tahitians who had accompanied them, and their descendants. When told of the French Revolution, and the series of naval victories achieved by his countrymen, the worn man threw up his hat, and exclaimed, "Old England for ever!" He had changed his real name of Alexander Smith to that which he then bore.

Christian knew of the existence of Pitcairn's Island, discovered by Carteret in 1767, and must have thought of it as likely to be a safe refuge. He was out of the ordinary track of vessels—truly 25° 3′ 37″ S., 130° 88′ 23″ W. Thither he directed the *Bounty*, but had some difficulty in finding it, as it was laid down 200 miles out of its real position. This was an additional safety, and the reason why the *Topaz* supposed hers to be a fresh discovery. A landing was with some difficulty effected. The small extent of the islet (under two square miles) was divided into nine equal portions among the whites. The *Bounty* was dismantled and sunk, so as not to attract attention from possible passing vessels. For three years all went tolerably well. The little community settled down to spend out their lives in their new home. Then the wife of one of the mutineers was killed by falling from a cliff. He attempted to allocate to himself the wife of one of the Tahitians. Disputes ensued, which, it is believed, Christian did his best to allay. But he and four others fell in the carrying out of a plan of the Tahitian men to kill all the whites. The few white survivors cleared off the colored males. Tragedies ensued between the whites themselves, and the year 1800 found Adams the sole survivor, with a community of women and young children. Misfortune had elevated and broadened his character. He had done his best to inculcate religious principles and to establish civilization and order in the little community.

The discovery of the retreat of the surviving mutineers, by the *Topaz*, in 1808, was not followed up. The Napoleonic wars gave people at home enough otherwise to think of. Six years later, two English frigates came upon the island. The commanders were so impressed with the almost idyllic state to which Adams had brought his charge, that no thought was entertained of transporting him to England. The fears of the community lest he should be, led to affecting scenes. Thenceforward Pitcairn was taken specially under British patronage. Adams passed away in 1829, aged sixty-five, in the presence of his family and of his affectionate flock, all of whom loved and revered him as a parent. He was succeeded in the government by George H. Nobbs, a missionary, who had landed, and who had married a granddaughter of Christian's.

By 1856, the population so pressed upon the means of subsistence that they, 250 in number, were transported to Norfolk Island, placed at their disposal by the British Government. Bishop Patteson took special interest in their welfare there. Three years later, sixteen hired a vessel and returned to Pitcairn, followed by twenty-seven in 1864. News was occasionally brought by her Majesty's ships that called off the island, leaving stores of provisions, clothing, and sundries such as soap and iron. Until of late years these reports were on the whole satisfactory. The last are of the most discouraging character, tending to prove the impossibility of a community that has once been brought in touch with civilization long existing without the power of expansion or of its members fully exercising their faculties. These last particulars are set out in the Parliamentary paper already referred to. They consist chiefly of reports of the commanders of H. M.'s Ss. *Comus*, *Constance*, and *Royalist*. The island now presents a barren aspect from the cutting down, and little care in replanting, trees. The population in August, 1898, was 142—fifty-one the descendants of Christian, forty-seven of Midshipman Young, the others of blood mixed with that of stray arrivals. There is no liquor, smoking is unknown, water the only drink. The men are strong and active; the women the same. General loss of the front teeth is noticeable, and "a want of something." "They do absolutely nothing all day," and refused the literature offered them. "An American missionary and his wife, who have been on the island since June, 1896, superintending the school, both assured me that the want of intellect among the young was simply appalling, and they had no hesitation in putting it down to this intermarrying. In fact, they had given up all hope of improvement and intended leaving by the first opportunity." "I am told the morals of the community are not what they should be." "I have no hesitation in saying," continues Commander Dyke of the *Comus*, "that soon the question will have to be faced—are they to continue as they are?—viz., marrying among themselves and increasing. The slender resources they have will not stand a much larger population, and among the young men a desire is evinced to leave the island."

---

*The most comprehensive book upon the subject is Lady Belcher's 'Mutineers of the Bounty and their Descendants in Pitcairn and Norfolk Islands,' published by Murray in 1870. A Parliamentary paper (C. 9148, February, 1899) brings the history of Pitcairn's Island down to 1898.

This is a gloomy ending of the story of Pitcairn's Island that opened so tragically over one hundred years ago. Relics of the *Bounty* are shown in the United Service Museum, Whitehall, London. D. B.

Correspondence.

TROS TYRIUSVE.

To the Editor of The Nation:

Sir: After reading your editorials in the *Nation* of the 20th inst., I cannot see how any one thinking like you on the questions of the day can help doing his best to beat William J. Bryan in the present contest. He stands for free silver and unlimited greenbacks; you admit that his success will break in upon our present prosperity; you might say that it would, as soon as the first coupon on a United States bond is paid in silver dollars, bring about a crash in the business world more acute than those of 1837, 1873, or 1893. Mr. Bryan is also pledged against "government by injunction"—that is, against any efficient repression of riots. The unruly elements would soon feel who is holding the reins, and anarchy, like that which raged in Pittsburgh in 1877, or at Chicago in 1894, would spread from the Aroostook to the Golden Horn.

All this, you think, ought to be submitted to in order to save the principles of the Declaration of Independence by restoring self-government to the Filipinos. But in another article you say that Bryan's platform was skilfully drawn so as not to pledge him or his party to the withdrawal of the American forces. He first wants to establish a stable government on the islands. The millennium may come before he has succeeded; meanwhile fighting and killing must go on. And when at last the islands are independent, he wants the American army and navy to guarantee that freedom against the rest of the world—a job requiring more men and more ships than if we held the islands as our own possessions. It is clear, therefore, on your own showing, that his professions against Imperialism and militarism are utterly hollow, and you yourself point to the Expansion Democrats in the South, such as Snodgrass and Morgan, in deference to whom the platform was cast into such unmeaning or double-sensed words. Would you, then, have the people of the United States take the risk of beggary and anarchy at home for the very remote possibility of freedom to the Tagalos and Visayas six thousand miles away?

So much from the general American standpoint. But to us Kentucky folks, this man Bryan, with his love for Filipino independence, looks like an unusually bold character. If Aguinaldo, the irregularly chosen Governor of Luzon, is now a fugitive from his home through the wickedness of McKinley, William S. Taylor, the regularly chosen Governor of Kentucky, is a fugitive from his State through the wickedness of Bryan. In November, 1899, William Goebel, the murderer of Sanford, the author of an infamous election law, the man who had by trickery and force gotten some sort of a Democratic nomination, was, notwithstanding numberless frauds on the ballot perpetrated in his behalf, defeated for his coveted Governorship, through the revolt of the best elements in his party, among them over two-thirds of the former rebel soldiers. But he was still reluctant to give up the fight. He had by false returns and by bribery secured a close majority in the two houses of the General Assembly. Then William J. Bryan came to Frankfort all the way from his Nebraska home, to encourage Goebel and Beckham and the other defeated candidates on the State ticket in their treason against free government, which rests on the expressed will of the majority. In a speech before the Democrats of the Legislature and the beaten candidates, he congratulated the latter that they had a partisan body before which to try their case. Without his advice and encouragement there would have been no contest. That Kentucky is now governed and administered by a set of men whom the majority of the voters had deliberately rejected, and who are denounced this day by the greater part of the people of Kentucky as robbers and thieves, is due to William J. Bryan, who wants self-government for the distant Malays, but thinks a self-chosen band of schemers are a good enough Government for the great State of Kentucky.

Truly yours, L. N. D.

Louisville, Ky., July 28, 1900.

[Every item in the above indictment of Bryan has weighed with us in resolving to cast no vote for him. But most of them are reflected if not matched in McKinley's career as an unprincipled politician; and, character for character, we have no choice between these charlatans. We repudiate both, and we propose to do what we can to prevent this people from giving its seal of approbation to the present misruler of its destinies.—Ed. Nation.]

ARITHMETIC AND GRAMMAR.

To the Editor of The Nation:

Sir: I have not had an opportunity to read the paper on Arithmetic, read at the recent Charleston meeting, from which I see interesting quotations in the *Evening Post* of last Monday. These quotations indicate that the author is in sympathy with the now prevailing opinion that too much time is given in schools to the subject of arithmetic. It may be that too much time is given to certain rules, some of which he enumerates, such as partial payments; but that too much time is given to the accurate working and to the reasoning which most of arithmetic demands, is quite another question.

The attack upon arithmetic is at bottom the same as that made some years ago upon English grammar. This attack proved so powerful in the latter case that old-fashioned grammar, with its parsing drill, was largely banished, and we were deluged with new language lessons, each with some wonderful method and catching device. What has been the result? I believe I am correct in saying that the verdict of examiners is almost unanimous that pupils who have been through the first and the second part of these language lessons are clearly behind the former students of the old grammars in real knowledge of the structure of English sentences, and in the power to analyze intelligently the force of a simple prose passage. As a teacher of freshmen I find a woful lack of knowledge of the simplest syntactical principles—such, for example, as the passive voice and the predicate nominative, which seem to be favorite rocks of offence to the scions of language lessons.

The trouble, it may be said in passing, appears to lie not so much in the work of high schools as in that of the grammar schools. The high schools have their own work to do, and the pupils who come up to them poorly drilled in first principles are likely to remain so. There is reason for the general dissatisfaction with the work and results of the last two years of the grammar schools. In these years pupils seem to suffer a sort of arrested development, and to be merely marking time. My own conviction is that it is because the work is not hard enough.

At bottom the attack upon arithmetic and grammar is an attack upon training and drill, and in support of a demand for what is supposed to be directly useful and practical. This spirit, good to a certain extent, has substituted many ill-digested fads for the systematic training which formerly obtained. The feeling that it is necessary to give young pupils an amount of useful information has produced the necessity of making a fight upon the time of the old studies that made largely for mere mental training. If we are to teach Nature studies and hygiene and physiology, we must, of course, parse less and do fewer examples in arithmetic.

That the devotion of a short time in grammar schools to simple talks on the wonders of nature and the well-established laws of health is a good thing, no one can doubt; but the text-books on such subjects cannot be of real value for mental training, for the reason that it is impossible, in the nature of the subject, for them to be full and scientific.

To return to arithmetic, my own observation leads me to the conviction that, in our American schools, we do too little rather than too much. The average boy out of our high schools would go to pieces in any English civil-service examination. The examinations at West Point and, especially, at Annapolis are the only rigid examinations in arithmetic that we have.

The sooner we can get back to the idea that schools are primarily for training, which can by and by inform itself, and only secondarily for enforced information, the better it will be for the cause of real education. Our aberrations have been altogether natural and somewhat beneficial; but we need to get back into simpler lines, with fewer studies, better done and followed farther.—Very respectfully,

J. H. DILLARD.

July 25.

Notes.

Following Schiller's "Wilhelm Tell," Act I., in their "idiophonic texts for acquiring languages," Hinds & Noble, New York city, have in preparation the second act of the same drama, also edited by Prof. George Hempl of the University of Michigan, and the first book of the 'Anabasis,' of which Professor Hempl will be consulting editor. These volumes present on facing pages the original text, a verbatim English translation, a free translation, and the pronunciation of the original "by means of the universal alphabet of the International Phonetic Association and its publication, *Le Maître Phonétique*."

'The Encyclopædia of Etiquette,' by Emily Holt, is announced by McClure, Phillips & Co.

Cassell & Co. have in course of publication 'The Life and Times of Queen Victoria,' by the late Mrs. Oliphant and (for the latter portion) Robert Wilson. It will be issued in twenty-nine parts.

In our recent notice of Graham's 'English Political Philosophy from Hobbes to Maine' we omitted to give the name of the American publishers, Messrs. Henry Holt & Co. This firm will soon issue 'The Art of Debate,' by Dr. R. M. Alden.

A. C. McClurg & Co., Chicago, have in press and will shortly publish 'The Private Memoirs of Madame Roland,' edited by Edward Gilpin Johnson, with illustrations.

Mrs. Charles S. Fairchild (Cazenovia, N. Y.) has printed some pages additional to her interesting 'Journals of John Linklaen,' reviewed by us three years ago.

In M. C. Jones's 'European Travel for Women' (Macmillan), inexperienced travellers may find an almost bewildering number and variety of hints on equipment and deportment that are too intimate for the pages of Baedeker. The volume, though it runs to 300 pages, is light and portable, and is a singular monument of the passion for detail that governs the feminine mind. Every contingency, from one's bath to a "reputable undertaker" for one's burial, is provided for. The game of travel, if one must live up to all these rules, would be a hard game to play, and Italy reduced to a question of appropriate tips and precautions about wraps. It is a very correct and ladylike little work, and may be safely followed by any woman going abroad for the first time, alone, or with others as inexperienced. There is an appendix of simple and useful phrases in several tongues.

The list of books concerning "*Trusts*" is enlarged by Prof. J. W. Jenks's 'Trust Problem' (New York: McClure, Phillips & Co.), a work containing an interesting collection of facts, together with a fair amount of theory. The general impression conveyed is favorable to large combinations, as effecting material savings in production and distribution. With those who are hostile to these combinations, Prof. Jenks's authority will be impaired by the fact that he obtained his material through his employment by that "non-partisan" body, the Industrial Commission, and by the Department of Labor. The praise which he gives to the report of the Industrial Commission tends to produce a similar effect on the minds of those who have no pecuniary interest in these semi-political investigations.

Dr. E. F. Henderson's 'Side-Lights on English History' (Holt) is an accession to source-book literature, and a particularly handsome one in respect to printing, binding, and illustrations. It begins with Queen Elizabeth, and the text ends at 1818, although early portraits of Queen Victoria and the Prince Consort are reproduced. The method followed by the editor is to select a topic like the "Personality of Queen Elizabeth," "The Spanish Armada," "The Gunpowder Plot," "Characteristic Traits of Oliver Cromwell," "The Stuarts in Exile," etc., and then to examine it through the eyes of contemporary observers. In following out this system of portrayal, recourse is most often had to letters and memoirs. The illustrations with which the book abounds are likenesses taken largely from engravings. The thirty-two subjects chosen are all important ones, and Dr. Henderson has used good authorities, but we are somewhat surprised that he has furnished no notes and virtually no editorial comment. The book is intended for junior students, as may be gathered from what is said in the preface about the best means of employing it. Accordingly, we should expect some explanations, for it may well be doubted whether many persons will prepare themselves for reading the excerpts by following the course of preliminary study which Dr. Henderson suggests. Still, each man does his work in his own way, and perhaps we have no right to criticise the editor of a book like this for not filling in the gaps by disquisition, especially where so much valuable material is put within reach. Let us hope that Dr. Henderson will publish a similar volume on the period from the Saxon conquest to Queen Elizabeth.

'Historical Memoirs of Alexander I. and the Court of Russia' (Chicago: McClurg) is a translation, by Miss M. B. Patterson, of the book which Mme. de Choiseul-Gouffier produced in 1828, three years after the Czar's death. The author's own title has been preserved, and the text used is that of the first edition rather than of the second, which appeared in 1862. Although we shall not attempt to disparage the translator's part in this work, we cannot praise the 'Memoirs' very highly either as a piece of literature or of history. The Comtesse de Choiseul-Gouffier had the advantage of knowing the Czar well, but her writing is frothy and vain where her own contact with the Russian court is to be described, and her moralizing is of the most vapid kind. She had an extravagant admiration for Alexander, which, considering his personal appearance and fine sentiments, is not surprising. But she possessed neither remarkable knowledge of politics, unusual wit, nor much sharpness of observation. While she repeats several anecdotes that are worth preserving, her narrative does not sustain the tone of alertness and discernment which a good volume of memoirs should display. In short, the book is worth the labor of translation, but is distinctly of the second class.

Mr. H. R. Whitehouse, who has, we believe, been an attaché of the American legation at Rome, gives in his 'Collapse of the Kingdom of Naples' (Bonnell, Silver & Co.) an elaborate narrative of the events which lie between the publication of Gladstone's 'Letters from Naples' and the surrender of Gaeta in 1860. The motive of the work is purely historical, for there is no more likelihood that another independent state will be erected in the two Sicilies than in Poland. So far as Mr. Whitehouse advocates a special view, it is depreciation of the part which Garibaldi had in the annexation of the Bourbon dominions to Italy. He terms the campaign of the *Mille* a "filibustering expedition," and quotes with approval Professor Dicey's saying: "Low as Naples had sunk, the Government would, I am convinced, have been strong enough to withstand the onslaught of the Garibaldian invasion, if behind Garibaldi there had not stood the Kingdom of Italy." In estimating the character of Ferdinand II. and of Francis II., Mr. Whitehouse professes that he has chosen his authorities in the most eclectic manner. But while he shows the existence, in Italy as well as in England, of a desire to magnify the misdeeds of the two last Bourbons, he attributes the downfall of their dynasty more to the "benighted policy" which they followed than to external pressure. The book is written by one who has a good knowledge of modern Italian politics, and should be very serviceable to English readers.

Mr. W. H. Woodward's 'Short History of the Expansion of the British Empire' (Cambridge [Eng.] University Press; New York: Macmillan) is a school-book intended for the use of students who are entered at the training colleges of England—that is, for teachers in training. At the same time, the author wishes it understood that he has not prepared his book for purposes of "cram." The preface opens with: "This History is not a 'Manual,' *i. e.*, a digest of the general body of facts relative to colonial history. Events have been dwelt upon, or passed over, as they serve, or do not serve, to illustrate the broad, underlying principles which from time to time governed British Expansion." The distinction is well made, and, moreover, it is justified by the character of the finished work. At a moment when Jingo Imperialism is in the air, Mr. Woodward writes a quiet, sober account of British settlement in both hemispheres and in all latitudes. His volume is not a panegyric in disguise, and, from its broad manner of treating events, together with its general information, is of real educational value. A merely patriotic tract would deal at much greater length with recent developments than Mr. Woodward does. He maintains the historical temper, and writes even more fully about the American colonies which severed themselves from Britain than about Australia and South Africa, which are still politically united with the mother country. The circulation of this book should not be restricted to schools. One or two slight slips may be mentioned. Francis Parkman was not a professor, and in Canada all powers unassumed by the Dominion are not granted to the provinces. The reverse is the case.

The 'Second Book' of the Tarr & McMurry series of Geographies has just been issued by the Macmillan Co. Its convenient form and new method of treatment at once attract attention and call for commendation. The political and relief maps are excellent, but the same cannot be said of all the other illustrations, although in general these are distinctly executed. The entire book (435 pages) treats of North America, including the new dependencies of the United States. The first four sections, which take up so much of physiography as seemed to the authors to be necessary to explain man's relation to the earth, are less satisfactory in treatment than succeeding portions. This is the case notably with the first section. The treatment by States is abandoned, and that by larger regions is adopted instead. The topics introduced are discussed at considerable length and in connection with the region in which they seem most prominent. Thus, coal-mining, iron-ore, and iron-manufacturing are explained in connection with the Middle Atlantic States, while agriculture by irrigation, grazing, and gold-mining are considered with the Western States. Repetition is thus avoided and room for additional details is gained. The causal idea is consistently emphasized in the handling of all the topics. Teachers accustomed to many of the older style of books will miss some features, whose absence, however, is for the most part no loss.

T. J. Medina of Santiago, Chili, adds 'El Tribunal del Santo Oficio en las Filipinas' to his former works on Philippine bibliography. His large volume on 'La Imprenta en Manila desde sus Orígenes hasta 1810' (1896) has recently been corrected and enlarged in Spain by Señor Retana's 'La Imprenta en Filipinas.' Medina is also the author of 'Bibliografía Española de las Islas Filipinas (1523-1810).' This work was printed in Santiago (Imprenta Cervantes) in 1898.

The process of sanifying the centre of old Florence, by demolition and reconstruction, revealed most interesting relics both mediæval and Roman. These objects were carefully observed and preserved for the Crocetta Museum by the Historico-Artistic Committee appointed to that end by the municipality. A first volume discussing these finds has appeared, under the title 'Il Centro di Firenze: Studi storici e Ricordi artistici' (Florence: R. Bemporad). It has sixteen plates and fifty illustrations, and is of much importance, especially as to the city's rank in the Roman period. The builders who reconstructed the once noble quarter that had fallen from its high estate and become a menace to the health of Florence, are censured for the architectural decadence of their work.

Another significant Italian publication is 'La Revoluzione francese nel carteggio d'un osservatore italiano' (Milan: Hoepli). The editor, Senator Giuseppe Greppi, has availed himself of the family papers to annotate the letters, almost uninterrupted, of Paolo Greppi, a Milanese nobleman, Austrian Consul-General at Cadiz, to his father and friends. He was witness of many stirring scenes in Paris, Vienna, and Italy, and passes judgment on numerous historic characters of the Revolution.

The *Virginia Magazine of History and Biography* for July prints some interesting letters from Mrs. Ralph Izard, written from Paris in 1781-83. She describes how her husband, then in America, dined with Lord Cornwallis at Gen. Knox's soon after the surrender. "Mr. Izard was so vexed at the cruelty of his conduct throughout the whole course of his command, that he could not be induced to hold any conversation with him, and it was with difficulty he was prevailed on to meet him at dinner." She was won by the Marquise de Lafayette, who spoke with great warmth and affection of Washington, and "says I must look upon her as an American, for her heart is entirely so." From the new instalment of Conway Robinson's "Notes," it is learned that the first man-child born in the colony was in 1643 fined for contempt of court. Even at that early day, Virginia returned servants to Maryland—a sort of fugitive-servant practice, for no law existed in the matter. A very curious account current, 1777-1787, is printed, giving the items in paper, in specie, and the "rate of depression." The rate starts at 1½ for 1, and reaches 500 for 1, the latter quotation being purely nominal.

A conference, similar to that of 1890, met last month in Berlin for the discussion of reforms in the higher education in Prussia. Of the forty-one members invited by the Cultus-Minister, more than half were professors from universities or other higher educational institutions, while all who participated in the deliberations were men whose opinions are of weight. An important resolution passed almost unanimously by this august body, and which will no doubt ere long become law in Prussia, settles the "Berechtigungsfrage" to the effect that the universities and technical high schools shall be open to graduates of the Gymnasia, Realgymnasia, and Oberrealschulen alike; in other words, the "Gymnasium monopoly" will cease, and students whose secondary-school course did not include all the branches required for a certain profession, will have an opportunity at the University to make good the deficiency. On the other hand, it is not expected that the present constitution of the three classes of secondary schools will be much disturbed in the future. Thus, while the democratic idea of equal rights has found recognition, the continuance of the humanistic Gymnasium in its traditional form is at the same time assured. The conditions for obtaining the new degree of "Doctor Ingenieur" are published in the June number of *Hochschul-Nachrichten*, and include the presentation of a certificate of maturity from a German school of one of the three classes above mentioned. Hence, foreigners will be debarred from candidacy for that degree, unless they have received their secondary education in Germany.

In an address delivered by Archduke Rainer, the curator of the Vienna Academy of Sciences, at the recent annual meeting of that body, the fact was particularly emphasized that the coöperation of the leading academies of sciences, a consummation which had been so devoutly wished, has now been practically attained through the Convention at Wiesbaden of the representatives of the academies of Berlin, Goettingen, Leipzig, London, Munich, Paris, Milan, St. Petersburg, and Vienna. The object of this union is the achievement of literary undertakings of a grand and international character, the management of which is not possible for a single one of the federated societies. The determination of the details of this union is to be left to future conventions.

The Congress for Christian Archæology, at the recent Convention in Rome, by formal resolution, expressed its desire that the famous crypts under the Vatican be opened to the researches of specialists. It is, perhaps, not generally known that underneath the Basilica of St. Peter there are long galleries, a subterranean church, incomparably richer than the church above ground. Here, among other things, was discovered, in a kind of dark cellar, a massive granite block, which proved to mark the grave of Otto II.; moreover, statues of bishops, masterpieces of Ghiberti, and a large number of bas-reliefs, in which the artistic hand of Mino da Fiesole was detected. Unfortunately, this storehouse of art is closed, not only to the general public, but also to the student; entrance being allowed to those only who secure permits signed by the Pope himself.

Among the results of Mr. J. E. S. Moore's scientific expedition to East Africa are the determination of the maximum depth of Lake Nyassa (430 fathoms), and the real position of Lake Tanganyika, the northern part being some twenty miles further to the west than it appears on existing maps. From his observations, doubt was thrown on the suggestion "that the lake had at one time been connected with the sea, but the geological formation on the west shore favors the supposition that at one time the lake extended far to the westward, and covered some portion of what is now the Congo Basin." The highest peak of Mount Ruwenzori was ascended, and found to be 16,500 feet, the snow-line being about 13,000 feet. Mr. Moore came to the conclusion that it is neither an isolated mass nor a plateau, but part of a mountain range, with many jagged peaks extending for many miles in a north and south direction. He brought back, in excellent condition, about a thousand fishes, some of them of great size, and some new to science.

—The *Atlantic* for August opens with an article on "Political Education," by President Hadley, who dwells on the tendency to "cram with facts as a substitute for the development of ideals." In the course of his remarks he points out that the real justification of democracy, or majority rule, is not theoretic, but practical—the best means hitherto devised of getting at the opinion of those who in the end hold the power. It does not follow that there should be an election every six months, or that Croker and Platt should be the best we can show for it. Having Croker and Platt in mind, it is worth while to read Rollin Lynde Hartt's "The Iowans"—an account of a community at once distinctively American, and at the opposite pole from the one in which we live. Mr. Hartt's style is distressingly forced and pseudo-picturesque, but his description of Iowa, if not flawless, is suggestive. A community of farmers, without large cities, and having a high level of civilization, it is a community without a State debt, and which is capable of building a Capitol for $3,000,000 without a penny being stolen. It has "just a little political corruption," owing to railroads, but, generally speaking, good laws, good schools, and good morals. It has no literature but newspapers, no art, no great men; but then, says Mr. Hartt, repeating what has been said so often, it is "the merit of the mass," not of the individual, that establishes "the real greatness of a people." Leaving aside the question whether there ever was a very remarkable "mass" which did not soon produce remarkable men, the Iowan community (as described by Mr. Hartt) is a sort of resurrection of Jefferson's ideal agricultural *civitas* of honest farmers, perfected by a high material civilization, and the final crowning boon of the absence of greatness of any kind. Were Buckle alive, he might cite Iowa as additional proof of the truth of his theory that man is the product of his physical surroundings. Just as lofty mountains, dangerous precipices, and continual elemental strife produce timidity in man, so extensive prairies produce in him flatness. Mark B. Dunnell has a paper on "Our Rights in China," in which he analyzes Mr. Hay's recent correspondence with the Powers on the "open door." The matter would be a good deal simpler if it were clearly understood that Mr. Hay's whole effort was to find out whether the Powers intend to respect our treaty rights with China, or to override them. "We do," say most of them. "We do," says Russia, "in so far as they need to be respected." The correspondence merely makes explicit what was implied in the situation already. Its value lies in making public and more intelligible what was previously important but little understood. Mr. Hay's journalistic training stands him sometimes in good stead.

—The *Century* has for its Paris Exposition article a paper called "The Palace of the Dance" by Jean Schopfer, with many illustrations, and for illustrations in color gives some remarkable full-page plates (from drawings by James C. Beard) to accompany an article on the "Treasures of the New York Aquarium," by Charles L. Bristol. Amelia Gere Mason contributes a paper on "The Decadence of Manners." Formerly this essay—for its main drift is not original—was always replied to by a counter-essay showing the manners of the world to be about as good as they ever had been; but lately the reply has grown fainter and fainter, as if the world were gradually growing accustomed to think of itself as an ill-mannered world, and becoming indifferent to its evil name in this respect. And in truth, if we are all ill-mannered together, does it matter? One great recommendation of good breeding used to be that it enabled people to obtain admission to a society above them; but admission to society is now secured by money (the writer of the present article to the contrary notwithstanding) to such an extent that this view of the subject needs revision. Perhaps, after all, money furnishes the key to the whole question. Society has always, in every age and clime, been carried on by those possessed of the wealth and leisure of the community. Hitherto these have been more or less in the hands of the inheritors of breeding—breeding being confessedly something which is transferred from parents to children. At the present day, however, the ignorant, and ill-bred, and non-bred have been coming into possesion of the money and leisure by leaps and bounds, and naturally their first effort is, *not to qualify themselves for their position by copying the poor people who pay great attention to civility, but to get rid of the whole thing as an encumbrance.* For ourselves we do not believe that democracy has half as much to do with it as plutocracy, for democracy is connected with equality, and manners in this country were, by all accounts, much better when conditions were generally equal than they are since the multimillionaire has fashioned his new world.

—*Scribner's* is a "fiction number," but it also has its plates in color (drawn by Henry McCarter)—midsummer "art plates" they should, perhaps, be called. The story of the magazines is pretty much the same as that of the libraries—nine-tenths of what is read is fiction, and most of it fiction which can be turned out by the yard. The striking thing, to our mind, about the monthly fiction that comes under our eye, is not that there is so much of it—for the demand is evidently greedy—but that the people who supply it are of a totally different class from that of the last generation. The producers of fiction, as we knew them in the last era, were serious people. Thackeray, Dickens, George Eliot, Charles Reade, Hawthorne, Flaubert, Turgeneff were all writers, not only sufficiently educated to begin with, but occupied with the problems of life and destiny, and having something of their own to tell us about them. In reading them, the young felt that they were listening to persons who had reflected, and caught the infection themselves. But since "realism" and "the short story" came in, a crowd of writers have taken up their pens who evidently avoid serious thought or cogitation of any kind. They no doubt paint life as they see it—but what a very limited life it is! They not only point no moral (anything moral being anathema to them), but they create no characters, and turn out "short stories," in most cases, evidently because the strain of writing a real novel with a sustained plot and substantial interest would be too much for them. Subject to these limitations, *Scribner's* for August is a good number. It is full of examples, however, of what we mean. It is mainly a child's number. "Old Carnations," by Albert Bigelow Paine, is for girls of fifteen; "A Matter of Opinion," by George Hibbard, is a piece of private theatricals for older children; "The Green Pigs," by Sydney Herman Preston, is adapted to boys of twelve or fourteen. J. M. Barrie and Edith Wharton are in a different class; but no sane person can look through this collection without perceiving "what is the matter" with fiction.

—Professor Kaufmann's 'Politische Geschichte Deutschlands im Neunzehnten Jahrhundert' (Berlin: Bondi; New York: Lemcke & Buechner) is the fourth volume of a series in which the Germans are estimating the extent and character of their national progress during the past hundred years. Besides politics, the review covers the fields of literature, art, science, music, social life, and the history of war. The scheme is well outlined, and the separate parts of it assigned to very competent writers. Comparing their present position with that of 1800, the year of the Marengo campaign, Germans can hardly be expected to refrain from showing some signs of thankfulness, and the patriotism which assumes such a form as this is equally sober and praiseworthy. Dr. Kaufmann's Political History is a book of 700 large-octavo pages, but it does not, in spite of its considerable bulk, run at any point into minute detail. It is a disquisition on tendencies, processes, and results, rather than a synopsis of events. The author, a firm Imperialist, believes that, while Germany has already accomplished more than Arndt, Niebuhr, Dahlmann, Uhland, and Stein could have hoped, her real work is just beginning. "Wir Deutsche sind noch ein junges Volk, und unsere Aufgabe für die Welt ist noch längst nicht erfüllt." Having full sympathy with the achievements of Prussia, he not only keeps that state in the foreground (which every historian must do), but exalts it to the neglect of the smaller kingdoms. There is nothing unusual about this, but we would gladly have heard more regarding the condition of Saxony, Bavaria, Würtemberg, and Baden, particularly from 1851 to 1861. The most valuable part of the work is the third chapter, which is devoted to the origin of parties, Socialists, Liberals, Junkers, etc. The account of the great Revolution, 1848-49, is also remarkably good, in that it keeps the main issues separate, and avoids the confusion which most writers create when they deal synoptically with the affairs of Germany during this crisis. Coming to the Bismarckian era, one finds a greater degree of conciseness than might be expected from the importance of the period and Dr. Kaufmann's admiration for the Chancellor himself. What are usually regarded as the heroic years of the movement towards German unity (those between the opening of the Schleswig-Holstein question and the end of the Franco-German war) are not singled out for special embellishment. Dr. Kaufmann's chief task is to explain the conditions which Bismarck found when he entered office. The contests with Austria and France are comparatively simple in motive. He dismisses them rapidly and without excess of patriotic rapture. The book closes with an optimistic forecast, but the narrative proper closes with the fall of Bismarck. Why does not Dr. Kaufmann give his impressions concerning the character of the present reign? On p. 681 he speaks of the freedom which prevails in the higher schools and universities of Germany. He certainly does not illustrate it by his reticence on the subject of German politics during the last ten years.

—It was formerly taken for granted that all animals to which the zoölogists attributed an "organ of hearing" could actually hear; but after the existence of a static sense in the higher animals had been determined by Goltz, Mach, Crum-Brown, and Breuer, and they had made it highly probable that certain parts of the ear—namely, the semicircular canals and the otolith apparatus—have nothing to do with the function of hearing, it became an interesting question to what extent hearing could be attributed to animals so low down that they have only the organs corresponding to the otolith apparatus. It was shown by Kreidl, a few years ago, that there is no sufficient reason for ascribing to fishes any sense of hearing whatever, and Dr. Theodor Beer has now reached a similar conclusion in regard to the crustaceans. Already in 1896 he had maintained that, except in a few instances, no proof had been offered that any animals below the amphibia can hear, and he now finds that even in those exceptional instances the proof offered was very inconclusive. Crabs especially had been affirmed by some investigators, and particularly by Hensen, to have truly remarkable powers in this way, but Beer has now proved, by well-conducted experiments, that such is not the case; the organs which were once supposed to mediate the sensation of sound are now made out to be organs of orientation only. In accordance with this now certain fact, it is proper that the names *otocyst* and *otolith* should be replaced by *statocyst* and *statolith*.

COLQUHOUN'S CHINA.

Overland to China. By Archibald R. Colquhoun, Gold Medallist Royal Geographical Society, Correspondent of the *Times* in the Far East, etc. Harper & Brothers. 1900. Pp. xii, 466.

This is a book of a sad opportuneness. Its three lightest chapters describe Pekin and the life of the foreign settlement there. The group of legations, isolated in the midst of a swarming population, hostile, ribald, contemptuous, appears so tiny and hopeless in its weakness, with nothing but the great vermilion doors of a red-lacquered and pavilion-roofed Chinese palace between it and the multitudinous darkness without. Yet the wonderful, clear, keen air of Pekin, the sunshine and the swallows wheeling through it, the slow, smooth life of an underworked diplomatic community, the little festivals and amusements, the summer villeggiatura in a Buddhist temple in the Hills, the skirmishes and jests of club life, give the picture a strange unreality. It is Life, ignorant, light, joyous, in the midst of Death. It is like the scene in Boccaccio's garden at Fiesole—and now as far away.

But none can say that there were not signs enough of the end. Dealing with the brutal frankness of Russian methods in Mantchuria, Mr. Colquhoun says (p. 144), "These high-handed proceedings must bring their own retribution in insurrections and riots." And we now have evidence that the spark to the Boxers' rising was the conduct of Russian and Belgian engineers towards the peasantry through whose lands the lines of rail were being run. Again, on p. 164: "In Pekin . . . only the ever-present fear of bodily chastisement . . . restrains the populace to an attitude of sullen dislike, or, at the very best, of polite indifference." P. 324: "the incipient anarchy in central China," "the revolution is proceeding with great rapidity." P. 325:

> "Outbreaks which the authorities are unable or unwilling to suppress give encouragement to risings all round, and one rising begets another. If the working people should be driven to arm themselves for defence against brigands, the temptation is great to use such new-found courage and force for aggressive purposes. There are no large bodies of men in the world so docile and so easy to govern as the Chinese, but once the social and family bonds which hold them together are loosened, the artisan may as easily become a brigand as the laborious fisherman becomes a pirate. The process of dissolution is going on. The anarchy which has been the nightmare of all who have studied Chinese affairs for the last twenty years is looming in sight. Great affairs are in course of incubation."

P. 336: "It is as certain as such things ever can be, that one of these days some Power will be called upon, or feel itself called upon, to intervene to preserve order in China, for confidence is gradually being undermined all round, and cannot be restored out of native resources." P. 449: "Nominally still alive and in full operation, the organism of the Chinese Government is hardly perceptible, and is unable to cope with foreign aggressions, barely sufficing to keep in restraint the three hundred and fifty millions of its own people."

The truth of all this is now abundantly clear. Northern China is in complete insurrection, though whether it is an insurrection with the Government or against the Government we cannot yet tell; Oriental governments have before now had their hands forced without great unwillingness. In the valley of the Yangtse-kiang, and in southwest China, the insurrectionary movements are still sporadic, but are evidently spreading; the stage of brigandage and outrages is passing into that of formal rebellion. And there are other ferments at work besides that of the Boxers. In 1874 an eighteen-year Muhammadan rebellion in Yunnan culminated, and was suppressed only after a hard struggle. Yet twenty years later, a full half of the population of that province, according to a native Muslim, was Muhammadan. This, however, is probably an enormous exaggeration. The certain point is, that there is a great Muhammadan population which has been in insurrection already, and is now biding its time. Again, there is a native Christian element which will not always submit itself in patience; the Taiping rebellion is evidence as to that. With the case standing thus, it is evident that the stability of China depends upon the attitude of the southern viceroys. There, too, Mr. Colquhoun has something to say. His charge is, that the influence and authority of the viceroys have been too much neglected. Until the régime of the Dowager Empress, they had been practically supreme in their provinces, with full right of initiative and almost no interference from Pekin. Yet European diplomacy had failed to see this and to cultivate them accordingly. All the diplomatic force was concentrated at Pekin, and "early in 1899 there was neither Consul nor Vice-Consul to represent British interests in the whole vast province of Szechuan." Now, with anarchy at Pekin, their chance has come again; the power taken from them is back in their hands, and the change has been reflected even in our newspapers. How they will bear this responsibility is still to be seen.

Such are a few of the points in which the opinions and predictions of this book come now with the force of accomplished facts. There is much more behind, and time will show it. From some of the quotations already given, it is evident that Mr. Colquhoun has no hope of China righting itself and developing peacefully from within as Japan has done. For him, some external force must take hold to restore and maintain order. "The open door" must give way, in the inexorable march of facts, to "spheres" of influence and of occupation. And so the real object of his book is to arouse the English public to the existing danger that the acknowledged English sphere in the basin of the Yangtse-kiang will vanish into the control of Russia or France. Russia is advancing upon it from the north through Hankau; France from Tonkin by the Red River railroad. Only very slowly is the connection with the British Burmese system through Yunnan being surveyed and planned; yet control of southwest China is essential to the defence of India. So, Mr. Colquhoun.

In a sense, the title of the book is unfortunate. Only the first six chapters deal with the overland journey to China, and on p. 150 we are landed in Pekin itself. The book thus divides into two parts, united only by the thread of the traveller's route and the shadow of the Russian advance. The first part deals with Siberia, of the past and the present, of the gradual Russian colonization, and its more recent quick development, of the wealth of the country in minerals, timber, and crops. Two things in it all stand out clearly. The new Siberia is not a convict settlement, but a field for immigration. And that immigration, from the Urals to the Pacific, is enthusiastically national: "Russia, mistress of the world" is its word. The last chapter of the six describes the great trans-Siberian Railway which stretches already to Irkutsk, and is to cross Mantchuria to Vladivostok. The second half of the book is a description of things in China as the author saw them during a seven-months' journey in 1898-99, through Mongolia and Mantchuria, up the Yangtse-kiang to Szechuan, through the provinces of Kweichau and Yunnan, and back to the sea through Tonkin. Making allowance for its frankly Russophobe attitude, for which, it must be admitted, there is much justification from an English point of view, the book is of the highest value, as showing us the state of the country before the present volcanic outburst. It cannot be neglected by any student of the gigantic problem.

There are four fairly good maps, and many rather poor illustrations and diagrams, several being reproductions from Reclus's 'Géographie Universelle.' The diagram labelled "Russo-French proposed rearrangement of Asia" is not clear in itself and is left unexplained in the text.

BUGGE'S HOME OF THE EDDIC POEMS.

The Home of the Eddic Poems, with especial reference to the Helgi Lays. By Sophus Bugge. Revised edition, with a new Introduction concerning Old Norse Mythology by the Author. Translated from the Norwegian by William Henry Schofield. London: David Nutt. 1899. Pp. lxxix, 408.

The present book is, in its main part, a second edition in English of Professor Bugge's well-known 'Helge-Digtene i den Ældre Edda,' which appeared in Copenhagen in 1896. The original work, however, has been revised and considerably augmented by the author, so that in many ways this is a new book apart from its English form. The newly written Introduction, which is an extremely valuable part of the work, contains the author's views as expressed principally in his epoch-making 'Studies on the Origin of the Scandinavian Stories of Gods and Heroes,' published originally in Norwegian and subsequently in a German translation.

Professor Bugge's views on the origin of Old Norse myths are so well known along main lines that they need, it may be, scarcely more than a recapitulation. His contention is, that many of the most important of these myths were shaped by Scandinavian poets who associated with Christians in the British Isles, and particularly with the English and Irish. The Eddic myths, accordingly, show an unmistakable familiarity with Christian European culture, and with Jewish-Christian and classical mythology and legend current among the Western nations in the early Middle Ages—with the manner of thought, in other words, of the more cultivated people with whom Norwegians and Icelanders came closely into contact during the storm and stress of the Viking Age. The oldest and, indeed, the great majority of the mythological and heroic poems of the Edda, Bugge concludes, were composed by Norwegians in the British Isles—the greater number in northern England, some in Ireland and Scotland, or in the Scottish Isles—and in a written form were carried to Iceland and Norway.

Bugge's proofs in support of this thesis are brought forward with much acumen, along a range of scholarship apparently illimitable. Influence from England on the Eddic poems may be detected, he affirms, in poetic expressions; in poetic, saga-historical, and mythological motives; in the action of the story, and in its composition. As for the first point, in most of the poems there are numbers of words of English origin not in general use in Norway and Iceland; in many cases these occur only in the Eddic lays, and must have been transferred to them from English poems. There are, moreover, Norse poetic expressions which are but reconstructions of English expressions similar in sound; Latin words taken into Norse from English, and Irish words. Into the details of the author's elucidation of these particulars it is here impossible to go. Some of his conclusions are tenable and must be accepted; others are plausible or even possible as theories, but hang by an altogether too slender thread to be readily accounted as fact, and this is a characteristic of much of Bugge's argumentation throughout the book. It is, however, by no manner of means all idle fancy, as some of his critics would lead us to suppose. In the 'Lay of Völund,' for instance, many of us are already prepared to accept the author's conclusion that the Norse poet imitated an Anglo-Saxon poem; the English words and reconstructions are unmistakable, and in such numbers that any other theory than that of immediate Anglo-Saxon influence is well-nigh impossible. It is not so easy to follow Bugge elsewhere. That the 'Lay of Sigurd' is an imitation of Anglo-Saxon poems; that the 'Lay of Atli' is in part, at least, the reconstruction of a Danish poem, which in its turn imitated an Anglo-Saxon original on the same subject; that the author of the 'Lay of Hyndla' was familiar with Virgil's 'Æneid'; that the heathen 'Völuspa' was composed by a Norseman in England under the influence of an English Christian epic—all this, and more, Bugge seeks to prove.

To show how the mythological stories of the Edda arose under the influence of Jewish-Christian tales which the Scandinavians heard among the English and Irish, Bugge examines in detail the myths of Baldr and Loki. In the story of Baldr, he sees the reconstruction of an older epic myth, in which, under the influence of English-Irish Christianity in the west, a principal stress is laid on the fundamental moral elements of life. Stories heard about Christ, the Son of God, are transferred to Baldr, the Son of Odin, but transferred in accordance with heathen Scandinavian conceptions, so that the new myths are still genuinely national in character.

Loki, however, is considered to be a new creation at the end of the heathen period by Scandinavians, after they had heard Jewish-Christian tales from Christian peoples. The name Loki is but the reconstruction of Lucifer, and the myth embodies elements in the first place from the Christian prince of the fallen angels, but also from other sources, especially from classical stories about Mercury. Loki's progeny, the wolf Fenrir and Mithgarthsorm, the world serpent, owe their origin to similar conditions. Fenris, Fenrisulfr, is a change, by popular etymology, of the foreign *infernus lupus*. The myth in its details is primarily the embodiment of the Christian conception of the devil as a wolf, with which have been fused stories of the monster Behemoth, in the book of Job. Mithgarthsorm, in much the same way, has its prototype in the Biblical Leviathan, and stories of Hercules have exerted their influence upon the development of the story. It may be unfair from some points of view to isolate a single link from the chain, but, with the assertion that there are throughout this whole discussion numerous places of the kind, the last paragraph of the introduction may be quoted:

> "In the description of *ragnarökkr* we read how the Mithgarthsorm, amid the billows, 'turns himself about in giant-rage.' Then the sea rushes in violently over the earth. This description agrees with that of Leviathan in Job: 'He maketh the deep to boil like a pot; he maketh the sea like a pot of ointment. He maketh a path to shine after him: one would think the deep to be hoary.' "

It is astounding that such assumed parallelism as this should be brought forward as sober testimony, and Bugge seriously weakens his argument, here and elsewhere, in much more important places, by his fatuous use of it.

The introduction contains much of value for itself, but it has also a fundamental importance for the understanding of Bugge's whole attitude toward the material under discussion in the present book, whose main object is to clear up the question of the home of the Helgi lays of the Elder Edda. This investigation is carried out, from first to last, with the infinite minuteness that is characteristic of the author's method, with the same marvellous power of combination of material and results, and with the same extraordinary bias as to the real nature of evidence in a scientific argument.

The Helgi cycle of the Edda consists of the 'First' and 'Second Lay of Helgi Hundingsbani,' and the 'Lay of Helgi Hjörvarthsson,' all of which form a single group in respect to saga material, and, to a considerable extent, to similarity in poetic treatment. The author of the 'First Lay of Helgi Hundingsbani' knew a number of the mythic and heroic poems of the Edda which one and all show English and Irish influence, and there are thus good grounds for believing that this lay was composed by a Norseman who had lived among Englishmen and Irishmen, at the courts of Irish and English kings. Some parts of the poem are closely connected with Irish traditional tales. A principal source is the story of Conchobar and the 'Battle of Ross na Rig,' which has come down to us in the so-called 'Book of Leinster.' This story of Ross na Rig contains reminiscences of the battle of Clontarf, in 1014, and the date of the poem is apparently, then, from 1020-1035. The Helgi poet, in the author's opinion, lived at the court, at Dublin, of Siggtryg, whose father ruled both at Dublin and in Northumberland. The poet has also used Irish tales of the story of Cormac's birth and of the 'Destruction of Troy' as material in his lay, which is, nevertheless, not to be considered in any way a translation of Irish stories, but is a new and original poem whose real basis is Germanic heroic saga-material.

The Helgi poems, according to Bugge, were influenced, again, by the Germanic saga of Wolfdietrich. The beginning of the first Helgi lay is, in fact, an imitation of a lost Anglo-Saxon heroic poem on Wolfdietrich which in its turn was a working over of some Franklish epic, also lost. This is not the whole record of influence, for the classical Meleager story has also contributed its quota.

In the 'Second Lay of Helgi Hundingsbani' the authorship again points to the British Isles, and the poem was composed under external influences similar to those which affected the 'First Lay.' The 'Second Lay' includes fragments of prose and verse which did not all belong together originally, and which are not all the work of the same author. The two lays belong, however, to the same school. The 'Second Lay' has influenced the 'First,' which it antedates by perhaps half a century. The Helgi lays, it is here pointed out, are not historical poems, and Helgi, as he appears in them, is in no way an historical person. Vigfusson, who originally suggested in the "Corpus Poeticum Boreale" a Western origin for many of the Eddic poems, noted that the geography of the Helgi poet is, on the whole, merely fantastic. There are a number of names of places, however, which can be proved to have really existed, and these are throughout in Denmark and the adjoining lands. Both these poems on Helgi Hundingsbani represent him, too, as King of Denmark. Helgi's historical prototype was Saxo's Danish king Helgi, son of Halfdan. Some Danish poet in England, according to the author, made over the story of this Helgi into that of Helgi Hundingsbani, basing his work partly on an Anglo-Saxon story and partly on the Danish story. This work then suffered two fates: it was carried into Denmark and took the form of which there are fragments in Saxo, and it was worked over by Norse poets in Britain in the shape in which parts are preserved in the Eddic lays. Helgi, at the outset a Scandinavian hero, is brought in the lays into connection with other heroes, not Scandinavian, belonging from the outset to other Germanic people. The assumed connection with Wolfdietrich, whose historical prototype is the East Gothic Theodoric, has already been pointed out. Both the 'First' and the 'Second Lays' make Helgi a son of Sigmund and the brother of Sinfjötli, and thus bring him into connection with the West Germanic Völsungs, with whom as a Danish king he could originally have had nothing whatever to do.

The 'Lay of Helgi Hjörvarthsson' includes a short lay in dialogue, called after one of its characters the 'Lay of Hrimgerth,' which plainly was at first a separate poem by another skald. It is apparently by the same poet who composed the 'First Lay of Helgi Hundingsbani,' and was inserted by him into the earlier story of Helgi and his father Hjörvarth. As before, there are English and Irish influences. The author in particular shows an acquaintance with the story of Scylla and Charybdis as it was known in

Ireland in the Early Middle Ages. Svafa, the betrothed of Helgi, in this lay clearly resembles in character Sigrun, Helgi's victory-genius in the 'First Helgi Lay,' and both have features obviously drawn from the Irish battle-goddesses as seen in the 'Story of the Destruction of Troy.' In the 'Lay of Helgi Hjörvarthsson' itself, West-Frankish, particularly Merovingian, stories of Clovis and his immediate successors have left traces. Helgi Hjörvarthsson corresponds to the Frankish Theodoric, the son of Clovis. There are also obvious points of contact, as in the case of the other Helgi lays, with the story of the Völsungs. In the author's opinion, this lay too was composed by a Norse poet in England, after various Frankish stories, which are transferred to a Scandinavian saga-hero, who is, again, a poetical and in no way an historical personality. The lay is subsequent to the 'Lay of Helgi Hundingsbani,' which was its immediate model.

In conclusion, Bugge points out the wider bearing of many of the results of this investigation. The stories of both Helgis, as has been stated, are influenced by, and in many ways connected with, the stories of the Völsungs and Niflungs, which are West-Germanic, originally foreign to the Scandinavians. There has been no general consensus of opinion as to how these stories, as they appear in the Völsunga-saga and the Edda, found their way from Germany northward. Of the younger Eddic scholars, Sijmons, for instance, maintains the usual theory that this happened through Saxon intermediation; Mogk, that the story was brought to Gautland by the Erulians, who had heard it from the East Goths, who in their turn learned it from the Franks; Golther, that a knowledge of the story first came to Danish and Norwegian Vikings in France and was then brought by way of Ireland to Iceland. Bugge believes, however, that the Scandinavians learned these stories in the West, especially in the British Isles and by association with Englishmen, and that poems in the Anglo-Saxon language were in part the source of this knowledge. It is plain that if this is a correct conclusion it is far-reaching, and the author hopes ultimately to prove not only that the Völsung stories as contained in the Edda were first composed by Norwegian poets in the West, who had associated with the English and Irish, but that essentially the whole poetic Edda has had a similar origin. He holds, in contradiction to the usual notion, that it is susceptible of proof that the majority of these poems have belonged together from the time of their origin, and that the younger presuppose the older. They represent, he says, different sides of one and the same tendency, and were composed under practically the same conditions and external impulses. The nucleus of the poetic Edda was not first gathered in Iceland. Norwegians in England and Ireland possessed the oldest and, indeed, most of the Eddic poems, already united into one collection, as early as the middle of the eleventh century.

That this is an extraordinarily interesting book, full of suggestion and ingenious theory, must appear even from the hurried abstract here given. Much of it, however, is but ingenious theory unsupported by actual evidence. The whole assumption, for instance, of the influence of the Wolfdietrich story upon the Helgi lays and the conditions under which it was exerted, which plays such an important part in the discussion, is, although plausible as a theory, as a fact wholly unproved. It may in part be true, but, as Bugge has left it, it is but a shrewd hypothesis and nothing more. It is impossible, too, to give credence except as clever guesses to his long line of lost Anglo-Saxon and Irish originals which are needed to substantiate his argument. As studies in evidence, what shall be said, to take instances quite at random, of the argument as to Hlöthvarth and Laertes; of the evolution of Atli into the son of Ithmund; or of statements like that with regard to Atli's dwelling at Glasilundi? Such a book, on the other hand, cannot fail to stimulate interest and further investigation in this whole wide field, where there is so much of vital importance to the history of the culture, not only of the Norsemen, but of the whole Germanic race.

The book contains, at the end, several appendixes, not in the original edition, and a complete index. The translation from first to last is admirably done. For the very first time in an English book there is a consistent writing of old Norse proper names.

A History of the University of Pennsylvania from its Foundation to A.D. 1770. By Thomas Harrison Montgomery. Philadelphia: George W. Jacobs & Co. 1900. 8vo, pp. 566.

In eastern central New York is a streamlet which flows south about ten miles and enters Lake Otsego; it may be considered to flow straight on and come out at the other end. To call this brook the Susquehanna River would be much the same as to call the College of Philadelphia, A.D. 1770, "the University of Pennsylvania." The brook grew and became a river; the college gained accessions and a larger name in 1779; but if a visitor to Philadelphia, in or about 1770, had inquired for the University of Pennsylvania, the probable answer would have been a silent stare, or, "There isn't any." If this work were the first volume of a series extending to the present time, or (say) to 1800, its title would be right enough; as it is, Miss Young is not called Mrs. Jones till she has been married, and it is well to give people and things their right names when we know them. So, again, on p. 35, Mr. Montgomery says, "The birth of the University marks the half-way point in Franklin's life." He means the birth of the Academy; nothing else (of that sort) was born in 1749.

A mere misnomer must not be allowed to detract from the author's laborious and exhaustive researches. He has gathered a vast array of documents and details, and it seems unlikely that anything related, however remotely, to his topic has escaped his clutches. Were his zeal in accumulating materials reinforced by equal discretion in sifting and arranging them, the result would be less ponderous and more penetrable by the average student's patience. The main points of his tale are these. "The Publick Academy in the City of Philadelphia" was founded, chiefly through Franklin's exertions, towards the end of 1749; it had a long array of "Constitutions," and twenty-four Trustees, whose office for some time seems to have been no sinecure. The often repeated story of its being started in 1740 as a charity school is based on the fact that, this school becoming insolvent, the new Academy purchased its premises and buildings on Fourth Street; later, the charity school was revived as an appanage of the Academy. In September, 1751, there were "above 100 scholars, and the number daily increasing." "The Rector, who teaches Latin and Greek," received a salary of £200; the English master, £150; the mathematical professor, £125; and three assistant teachers, each £60. The first rector, David Martin, died in December, 1751. His work was taken, though not his title, by Francis Allison, who became Vice-Provost in 1755. A new charter was granted in 1753. William Smith, afterwards eminent, became tutor in 1754, and Provost the next year, when the institution received an increase of dignity, being incorporated as "The College, Academy, and Charitable School of Philadelphia."

From this on, the history is mainly occupied with the Provost, as in its earliest part with Franklin. Smith (his name was not his fault, though it tends to confound him with his notable nephew and several others of that period or later) was a remarkable man; his abilities and attainments were fully equalled by his restless energy and fearless combativeness. He got into trouble with the provincial Assembly, who twice imprisoned him in 1758; by order of the trustees, he heard his classes "in the place of his confinement." Then he went to England, and came back triumphantly with degrees of D.D. from Aberdeen and Oxford, and a reproof from Privy Council to the Assembly. He was again in England 1762-64, raising money for the college, which by this time was drawing students from the country and from other provinces. New buildings were erected in 1762-63; we are favored with a minute specially ordering the carpenter to put up "shelves and cupboards." In 1757 a lottery had been resorted to for relief of the increasing expenses. In 1768 occurred what was probably the most important event in the whole history of the college, the opening of its famous medical school.

Among the minor details may be found some points of interest, as those relating to Hopkinson, Duché, and other alumni of those days, and to Leigh Hunt's father, who lost his M.A. diploma as the putative author of pieces alleged to be scurrilous. The experience of the trustees as to honorary degrees is notable. In 1760 they thought "it might be of service to the institution to confer" a few. Two years later it was their "unanimous opinion that the College must lose reputation by conferring too many." And as to coeducation, or anything approaching it, thirty "charity girls" had since 1753 been taught in the college building; in 1760 a committee found it "unbecoming and indecent to have girls among our students: it is a reproach to our Institution."

The history of the Academy and College to 1770, so far as it is important or suggestive, might be given in a few chapters. Mr. Montgomery has padded it out with "biographical sketches of the Trustees, Faculty, the first Alumni, and others," with liberal extracts from minutes of meetings, and other matter of a sort dear to a member of three Historical Societies and a Genealogical Society. This imperfectly digested mass suggests Whately's explanation of obscurity: a thing is so clear to the writer that he assumes it to be equally clear (and equally interesting) to his readers; hence he takes no pains to make it so. The sections badly need headings, but have none; even a table of contents is lacking. There is an index; but if you wish to know (*e. g.*) when the term "provost" was introduced, you are offered three cross-references, none of which proves of any use; then you can start far back in the history and read on till you are tired. You will get a date (say 1760) on one page, and further on find yourself advanced to 1757. In short, the book will be attractive to local antiquarians, but puzzling to the general reader.

The publishers' work can be praised more highly than that of the author-compiler. The volume is beautifully printed, and so correctly that we have noted but three errors; on p. 133, "Charles V. Krauth" for Charles P.; on p. 329, "1750" for (presumably) 1759; and on p. 304, "1910" for 1810.

The Civil Law in Spain and Spanish America, including Cuba, Puerto Rico, and the Philippine Islands, and the Spanish Civil Code in force, annotated and with references to the Civil Codes of Mexico, Central and South America, etc., etc., by Clifford Stevens Walton, Doctorando, University of Madrid, Licentiate of the University of Havana, etc., etc. Washington: W. H. Lowdermilk & Co. 1900.

The various influences that have combined since the Roman conquest to shape Spanish jurisprudence make it seem, in comparison with our own system, at once venerable and romantic. Here is no evolution of one homogeneous body of law out of two principal elements, themselves not too dissimilar to blend, but the persistence through twenty centuries of the enduring principles of the Roman law. Goths, Visigoths, and Moors came, took what they found, put each their own impress on it, and went—leaving the law of Rome the basic law of Spain. About its mighty fabric they reared their own creations, the *Fueros*, local and provincial laws and privileges that still remain, like the statutes and customs of Man and the Channel Islands under the British Constitution. Out of this lodgment the Spanish drove the Moors, in turn modified and added to the great edifice, and overgrew it with a tangle of ecclesiastical and administrative law that shut out much of its light and air; but it remained Roman still, not altered beyond recognition either by time or by fortune. Even Napoleon affected it but little. He was mainly concerned with codifying and clarifying what already existed—a proceeding that appealed to the Spaniard's love of logic and verbal exactness. This has been the principal contribution of French genius to Spanish jurisprudence, though the present century's slow trend toward liberalism, stimulated from time to time by the successive revolts of Spanish colonies, originated in the principles of the French Revolution.

This evolution is worthy to be studied by the profoundest philosopher. It is a poor imagination that would not kindle on finding in one body of law the codes of Justinian, the statutes of the Moorish Kings of Granada, the rules of the Holy Inquisition, the compilation of Philip the Second, made when Spain ruled the world, and those "Laws of the Kings of the Indies" which were in force in the capitals of the Aztecs and the Incas, over the North American continent, the Antilles, and the Philippines, more than two hundred years ago, and have not yet lost all virtue, although Spain has yielded her conquests to alien administrators. Mr. Walton attempts, in a hundred pages, a summary history of this evolution, which shows laborious study, but is necessarily dry. Unfortunately, too, his learning and industry are not accompanied by the gift of clear statement. He sums up his chapter on the existing civil law thus:

> "In defining the Spanish system of legislation, in general, it may be said that it comprises a collection of compiled and codified laws, and that it continues as such, even after the partial codification of the civil law by which, until the present, the so-called common law is alone referred to, besides which there are a multitude of laws still existing" (p. 87).

This is a very blind way of saying that Spain has a number of modern codes, like the civil and commercial codes, which, so far as they go, are the highest statute law; that, besides, there are many old codes or compilations, alive at least in part, among them the so-called *Partidas*, or codification of principles and maxims of Roman law, cited to-day even in the courts of Louisiana. Moreover, that, in addition to these codes, modern and ancient, alive or half-alive, there exists a mass of independent local laws and privileges (styled the *derecho foral*), and still other *leyes*, *reglamentos*, and *decretos*, of more or less limited authority. This produces a lack of certainty in Spanish law that is its worst defect. Were it not for the brevity and exactness with which Spanish statutes are written, and the strictness with which their language is construed by the courts, all would be chaos. Mr. Walton does not discuss this to any extent, nor does his translation of the Spanish Constitution, preceded by a brief sketch of its origin, compensate for the want of a clear statement as to how Spanish law is made or interpreted, and what comparative weight is to be given to its various elements.

The same endeavor to condense a great deal in a small space similarly limits the value of the rest of the book. It contains brief sketches of the Penal Code, the Codes of Civil and Criminal Procedure, the Mortgage Law, the Notarial Law, the Codes of Commerce, the Laws of the Indies; the Laws and Codes of Mexico, a translation of the Mexican Constitution; some observations on Cuban autonomy, a translation of the "Autonomical Constitution" of 1897; a few forms; an index of the Ancient and Modern Codes of Spain, the principal codes and laws in force in Cuba, Porto Rico, and the Philippines, and of certain Spanish-American constitutions and codes, necessarily abridged and incomplete. In addition to all this, there are given certain acts or proclamations relating to the American government of Cuba, such as the extension of the mortgage-suspension decree, among which the Treaty of Paris might well have been included.

In short, the book is full of clues for the student. He cannot rely on it alone to test a question of Spanish law raised in actual practice—say, the regularity of acknowledgment of a deed or articles of incorporation, the validity of a claim to mineral lands, or similar matters. The answer might be in the book, but there would be no certainty about it. The work is, therefore, a mere compendium of Spanish law, too broad in scope, and in execution too much abridged, to be of first quality. With this criticism, it may be said that it will find a place in every library where Spanish-American law is studied—not for citation as an authority, but for consultation as a book of reference, which is made easy by an excellent index.

Of the main body of the book, a translation of the Spanish Civil Code, elaborately annotated with references to ancient Spanish and modern Spanish-American codes, it is hard to speak so well. It does not fail for lack of pains, but for lack of skill. Unless the reader knows Spanish, he will find much of it wholly unmeaning, because the translator prefers to render Spanish words into their nearest phonetic equivalent in English, where an apt selection, a circumlocution, or the retention in parenthesis of an idiom incapable of exact translation would make the sense clear. For instance, we speak familiarly of the *status* of citizenship, not its *quality (calidad)*; of *powers*, not *faculties (faculdades)*; *gifts inter vivos*, not *donations (donationes)*; gifts *for valuable consideration*, not *having onerous cause (causa onerosa)*. This is bad workmanship, but capable of being understood. Where the theory of the Spanish law is strange to us, translation breaks down altogether. What sense do the words *institution of heir (institución de heredero)* or *forced heirs (herederos forzosos)* convey? The meaning of the first might have been rendered by *bestowal* or *creation of heirship*—*i. e.*, the power to dispose by will out of the circle of one's blood-kin. The second means *heirs defined* or *limited by statute*—*i. e.*, a limitation on testamentary disposition to certain blood-relatives, if living, somewhat analogous to our New York restriction on charitable bequests by a man of family. The following is mere jargon: "Art. 1274. In onerous contracts, the prestation or promise of a thing or services by the other party is understood as a consideration for each contracting party; in remuneratory ones, the services or benefits remunerated, and in those of pure beneficence, the mere liberality of the benefactor." Such a translation (and it is throughout marked by these defects) has no usefulness. In parenthesis it may be added that a good translation of the Civil Code has been prepared under the authority of the War Department.

The Distribution of Income. By William Smart. Macmillan Co. 1899.

In his interesting preface, Professor Smart explains how his mental attitude has been affected by the study of economics. For a number of years he was engaged in practical business, and in that way acquired the ordinary business-man's skepticism concerning economic theories and theorists. Taking up the systematic study of economics, he spent some time in revising his experiences and getting rid of his misconceptions. Thus he naturally delayed grappling with the "supreme problem" of distribution until the unconscious influences of learning and teaching made up his mind for him. When he finally reached the point when deliverance was necessary, he decided to take his own difficulties as representing those of the ordinary man. Even when he began writing, he retained the long-rooted conviction that the present distribution of wealth was bad, and even unjust; but as his knowledge broadened with his study, he was compelled to modify and, indeed, to surrender this conviction. For a great deal of the national income is distributed while and as it is made; the processes of production and consumption are the same. If we inquire into the conditions under which the disbursements of the employer, the paymaster of organized industry, are made, we find that the distribution is not arbitrary, much less chaotic. Professor Smart observes:

> "One may, perhaps, imagine a better distribution, although it seems to me it is not easy to do so except by assuming that society is much simpler than it is, or that it is willing to renounce many of its motives as well as its gains. Nor am I insensible to its anomalies and hardships. I confess, indeed, that they are enough to confuse the generous mind, and drive it to ill-considered action. . . . But when the question is whether a regulated state control, according to any social or socialist ideal, would bring us conditions of life wherein all would have the possibility of realizing their moral being, or of being what is called 'happy,' I am disposed to think that the invisible hand—however one interprets Adam Smith's reference—is bringing about these conditions more quickly than any deliberate rearrangement of industry would."

It is easy to see that, under a somewhat narrow title, Professor Smart really contemplates the whole science of political economy, and we are almost inclined to call this essay one of the best statements of the modern form of that science. There are more elaborate discussions and analyses, and Professor Smart claims no originality; but within a moderate compass he has succeeded in presenting the results of contemporary thought in a systematic and lucid manner. The modern conception of society is in accord with the philosophy of Heraclitus. Everything is in motion; there is an incessant flux. "Wealth is a flow, not a fund." The production and consumption of wealth describe a circle, as the water in a stream describes one. The water flows to the sea, is evaporated and condensed, and returns to the fountain-heads to renew its circuit. Man is in the stream of wealth, like a trout in a stream of water. He builds himself up and grows, and then sinks back and is resolved into the materials whence he came.

> "He is but a worm that fills its skin and draws its life from the earth, which it passes through itself and leaves on the grass again. He makes the world richer as the worm makes the surface richer—by bringing matter from one place and leaving it in another. . . . We think of man as somehow apart from and above his natural environment, contemplating it, working on it, and subduing it to himself. Yet any deeper consideration shows us that man is simply the last and greatest embodiment of his environment, and is, after all, but a temporary embodiment."

We do not need to question the metaphysical accuracy of this view of society, but whether it is so helpful as is believed in such practical matters as economic legislation is a different matter. If we are to take income in this broad sense, how can we exclude the services which every individual renders to himself? Moreover, we may not omit from our reckoning the vast number of what might be called negative satisfactions. Gambling is the regular pursuit of some persons, and the occasional occupation of many. In the broad sense, much wealth is thus created; the winner gratifies his desire, but so does the loser. Yet it is paradoxical to contend that the national income is enlarged by gambling. We have to distinguish between the kinds of satisfaction which make up life; and the distinction made in common speech between the destruction and the consumption of wealth, between material goods and psychological gratifications, cannot be disregarded. Nor are we prepared to concede that the line drawn by the older economists between productive and unproductive labor is not of the greatest importance. If we undertake to include the whole life of man under economics, we diffuse our investigation over infinity. We must abstract, if we are to create a science rather than an aggregation of phenomena, and we are forced back to the point of view taken by Mill. We must, indeed, regard man psychologically; but we must, for practical purposes, regard him only as engaged in producing and consuming wealth.

In treating of wages and profits, Professor Smart argues against the claims of the trade-unions, as set forth by Mr. and Mrs. Webb, but we fear that they will regard him as guilty of the fallacy of composition. Granting that the individual, or the "average" employer, can pay no higher wages than he does, it does not follow that the whole class could not do so, and that is exactly what the Webbs maintain. They assert that capital would not cease to be accumulated were the rate of interest reduced, and this Professor Smart, rather unguardedly, concedes. In that case it does not appear inconceivable that wages should rise with the fall in the rate of interest. Still, Professor Smart's argument is ingenious, and deserves careful study. He has an even more formidable difficulty to encounter in the phenomenon of rent, or the "unearned increment." Here his argument is altogether insufficient to meet the requirements of the advocates of the "single tax." It amounts to little more than saying that the rent of land is only one species of a large genus. In spite of some weak spots, however, Professor Smart's essay is a persuasive, if not convincing, argument in defence of the existing system of distribution, on the ground that it approximates as closely to the ideals of justice as any scheme that does not wholly disregard the requirements of practical life.

Wesley and Methodism. [World's Epoch-Makers' Series.] By B. F. Snell, M.A. Charles Scribner's Sons. 1900.

Except that new books are often read where old and better ones on the same subject are neglected, the demand for a new life of Wesley was by no means clear, much less acute. Tyerman's exhaustive biography gives all the necessary facts; Miss Wedgewood's psychological study is as good now as when it was written; while, for a short life, that of Overton in the "English Religious Leaders" series was too well done to be easily surpassed. Mr. Snell's book is distinctly inferior to Mr. Overton's. With such a wealth of material to draw upon, it is astonishing that it should be so meagre in its acquisition. It is fundamentally at fault because the writer has no genuine sympathy with Wesley, no real admiration for him. Coming to the last page, we read with a feeling of surprise that "Wesley was a glorious being," so little has there been in the course of the book to justify such a eulogium. A note of depreciation, of innuendo, continually recurs, and, while there is much rebuttal of charges made against Wesley by his opponents, we get the impression that Mr. Snell finds more satisfaction in retailing the injurious matter than in correcting its mistakes. This is particularly so in the chapter called "Love and Death," in which the voluptuousness of Wesley's sexual imagery in describing the soul's relation to its heavenly bridegroom is dwelt upon with an unction that betrays an unfriendly disposition. Another example is the chapter called "Miracles and Mysteries." The miracles are those in which Wesley too credulously believed, and the mysteries are those of Wesley's married life, and, in general, his relations with women. That he had here a silly side is one of the most patent facts of his career. Mr. Snell does not exaggerate the truth, but accentuates it out of all proportion to its importance in the synthesis of Wesley's life and work.

The arrangement of the book is topical, not chronological. No clear idea is given of the order and development of Wesley's life. The treatment of Whitefield is much more favorable than that of Wesley; his more rabid emotionalism is applauded; but of the Calvinism that distinguished him so sharply from Wesley and threatened to divide them by an impassable gulf, there is no mention whatsoever. There is no clear presentation of the spontaneous and largely accidental growth of that organization of Methodism which has been too much credited to Wesley's organizing genius. Equally unsatisfactory is the treatment of Wesley's extremely complicated relations with the Church of England. But these particular defects are trifling in comparison with the general inadequacy of the book in its report of Wesley's character and influence.

"More striking than any history can possibly be, . . . and more entertaining than any fiction."

The Nation.

NEW YORK, THURSDAY, AUGUST 9, 1900.

The Week.

The Commission headed by Judge Taft, it is announced, has organized a civil government for the Philippines, to go into operation on the 1st of September. The Commission will be the Legislature of the islands, and it must also be the executive and the judiciary. It may appoint judges, but they will necessarily be subordinate to the Commission and will be removable at its pleasure. The laws which it ordains will be enforced by our troops and it will be hard for the Filipinos to discover how their condition has been altered. They can hardly be persuaded that they are governing themselves, and if they are not, they are probably indifferent to the titles which their rulers bear. The only sign of progress that is discoverable is the report that Judge Taft is examining the heads of the religious orders concerning their estates, and finds that the extent of their claims is smaller than was supposed. If this be true, some settlement of a very difficult question may be feasible.

Gen. MacArthur reports the capture of a small body of American troops by the Filipinos at a place not far from Manila, a loss insignificant in itself, but showing how precarious our position is. At the War Department the occurrence is regarded as a proof that the insurrection is still in a fairly organized condition, and that Gen. MacArthur's objections to the withdrawal of troops from the Philippines were well founded. Indeed, the War Department is said to believe that the effect of withdrawing two or three regiments for service in China has been to encourage the enemy to renew active operations. The conduct of the officer commanding the band of Filipinos which inflicted this reverse on our arms appears to have been highly honorable. He returned to us the wounded American soldiers, and assured us that the prisoners should be well treated. Such behavior is hardly to be reconciled with the hypothesis that the only Filipinos opposed to our rule are robbers and cutthroats.

Secretary Hay's straightforward reply to Li Hung Chang's suggestion that, if the allies would not march on Pekin, the foreign Ministers there might be sent, under safe escort, to Tientsin, ought to have brought the Chinese Government to its senses, if any diplomatic communication could. Secretary Hay declared, in clear and unmistakable language, that "this Government will not enter into any arrangement regarding the disposition or treatment of the legations without first having free communication with Minister Conger"; that "the responsibility for their protection rests upon the Chinese Government"; and that if that Government can deliver the Ministers at Tientsin, it can open the direct communication with them which is insisted upon. Nothing could be in less need of construction or interpretation than this. It hardly needs to be pointed out, of course, that such a declaration of policy practically amounts to an ultimatum on the part of this Government. Until the demand of the United States is granted, diplomacy has in this direction no further field.

It is regrettable that, just as the allied forces are beginning their advance upon Pekin, news should be received of an alarming prevalence of sickness among the American troops. The Ninth Infantry, perhaps the best regiment we had in the Philippines, and presumably a first-rate example of the "well-seasoned troops" which the United States was to employ in China, reports a sick list of 257. If we add the 140, or thereabouts, which this regiment lately lost in battle, we have a total of about 400 men to be deducted from the regiment's effective strength. The sick list, of course, bears an extremely large proportion to the whole, and c[illegible] prove disquieting to the public m[illegible] With the dreadful experiences of th[illegible]nish war to guide us, and with the a[illegible] in much readier condition for the field than in 1898, there has seemed good reason to hope that the story of disease, whether epidemic or climatic, would not be repeated, but that the health of the troops would be abundantly safeguarded. The excessive amount of sickness does not, however, appear to disturb the officials of the War Department, who point out that Tientsin is an old and filthy city, without drainage or sanitation, and with a water-supply reeking with pollution and contagion. Under the circumstances, and considering the change of climate, a sick list of 50 per cent. would not, they say, be surprising. It is to be hoped that present conditions may speedily improve, and that the preparation of field hospitals and hospital-ships and other medical and surgical supplies may prove adequate to the emergency.

In Mantchuria the Russians have open hostilities to deal with; and while their forces appear to be sufficient to hold the Chinese in check, a considerable body of troops is likely to be required in that quarter for some time yet. This means not only less effective coöperation with the other Powers in the concerted movement towards Pekin, but also a serious check to the progress of the railroad. Great Britain is reported to be assembling a strong fleet in the neighborhood of Shanghai, not only for the protection of its own interests there, but also as a safeguard against a possible hostile move by other Powers. From the interior come reports of massacres of native Christians, but most of these lack confirmation. Whatever its causes, however, there is every evidence that the ferment in the empire is widespread. Just at present, fortunately, the divided councils in the Chinese Government itself, together with the apparent friendliness of some of the viceroys for the foreigners, while complicating the situation, make, on the whole, for safety, by preventing the united action which foreign interests have most to fear.

The extent to which the coöperation of Japan can be counted on, by Europe and America, in the ultimate adjustment of the status of China, is a question likely to become of increasing interest. The fact that Japan, at the close of its late war with China, was deprived by the jealousy of the Powers of some of the fruits of victory to which it felt itself entitled, has encouraged the feeling that it would be only too glad, when the convenient season came, to subject its old enemy to further humiliation. The willingness of Japan to send troops to the disturbed region, and to lead, if desired, in the work of pacification, has received no end of applause and sounding commendation, while the remarkable preparedness of the Japanese forces has been in striking contrast to the imperfect equipment of the European contingents. Beyond the restoration of order, however, it is by no means clear that Japan can be counted on to join, as a matter of course, any "concert" which the other Powers may choose to arrange, especially if partition is a part of the programme. So far as can now be seen, the interest of Japan, with regard to both its internal peace and its foreign relations, is in preserving the Chinese territory and the Chinese Government intact. It has no reason to wish half-a-dozen foreign nations established at its doors, nor anything to gain from the international friction which would inevitably result. Moreover, notwithstanding the strides which Japan has taken in civilization, we must not forget that the Japanese have, at bottom, more points in common with the Chinese than with Europeans, and that their present activity does not necessarily exclude great sympathy for their antagonists. Doubtless, this sympathy will not tie their hands in the present emergency, but it is a weighty factor to reckon with in thinking about the future.

Silence sometimes has a significance more impressive than speech. Such is the case when the man who was McKinley's chief rival for the Republican nomination in 1896, and who was elected Speaker of the Republican House in 1897, says that he is "too busy a man" to make any speeches for the party this year. The election in Mr. Reed's own State comes next month, and it will be the first time in thirty years that he has not been on the stump. The silence of Thomas B. Reed will contrast sharply with the volubility of John Barrett and the other substitutes who will be put in the field. The most significant feature of the incident, however, is not the loss of an orator whose support would be of immense service to McKinley. It is the fact that this great figure stands for a class of Republican voters of no small dimensions. A very noteworthy feature of the canvass is the large number of Republicans who manifest no enthusiasm for their party, and who are not inclined to exert themselves for its success.

The letter from Mr. Charles Francis Adams, published in Saturday's *Evening Post*, should be read and digested by the large body of citizens who are in doubt concerning their duty at the coming election. They will not be likely to meet with any clearer or more carefully reasoned statement of the conditions of the probabilities, and even those who do not find it conclusive will admit its cogency. Probably most independent voters agree with Mr. Adams that an opposition majority in the House of Representatives is desirable. If it cannot improve our situation, it can prevent its getting worse. Not so many have his confidence that Mr. McKinley will be more conservative in his second term, or that the Jingo Republicans of the Roosevelt type will be discredited by the loss of the House of Representatives. As to Mr. Bryan's Anti-Imperialism, Mr. Adams forcibly presents the conviction which deters a great many Independents from voting for him. They do not believe, judging from his course about the treaty with Spain, that he is opposed to extending our sovereignty over other peoples; and they still less believe that there is any such opposition among the Democratic leaders. As Mr. Adams says, no one thinks that the people of the Philippines can be elevated to Tammany ideals of self-government within one, or a dozen, Presidential terms. Concerning the wisdom of organizing a third party, we doubt if those who favor the movement will be deterred by Mr. Adams's argument. They are, for the most part, voters who have made up their minds that the condition of the country will not be much worse or much better, whether Bryan or McKinley is President, and who are tired of having their political activity limited to choosing between evils. They see no hope of anything better in the future unless there is a revolt, and whether their numbers are sufficient or not to make their protest impressive, they will at least have freed their consciences. But, of course, this can be accomplished by simple abstention.

Mr. J. Sterling Morton's paper, the *Conservative*, republishes the speech made by Senator Money of Mississippi against the treaty with Spain while Mr. Bryan was himself urging its ratification. It would seem as though Senator Money was addressing himself particularly to Mr. Bryan when he said:

> "We are told that we want peace; that we want to get the volunteers home. We all do. Everybody wants peace. I want the volunteers brought home. . . . Does any man say we are going to have peace by ratifying this treaty? Yes; we will have peace with Spain, but we will begin war with the Filipinos. . . . If we ratify the treaty with no declaration in it that we disclaim any right to enslave these people, or to hold them in subjection, or use language which does not mean giving them their liberty, we have already embarked in a war that will not release the volunteers, but which will call for fresh volunteers, and thousands of the best American youth will lay their bones upon the plains and in the jungle of Luzon and in other parts of the Philippines."

Referring to the Bacon resolution which Mr. Bryan wished to have adopted simultaneously with the ratification of the treaty, Senator Money said that there were several such resolutions before the Senate, but that they amounted to nothing because they were mere declarations of opinion. Congress might pass them to-day and repeal them to-morrow. They did not fix the status of the Filipinos. They did not disband the army. They did not put a stop to bloodshed. The only place to accomplish these things was in the treaty itself. He (Mr. Money) could not vote for a treaty without stipulations insuring peace engrafted in the instrument itself. With such stipulations he believed that it would receive every vote on his side of the chamber.

Perhaps the most noteworthy of all the Government returns for July are those which deal with the new issues of banknote circulation. During the month, $12,331,000 in this currency was issued to the banks, and, allowing for circulation retired by other institutions, the net increase was $10,455,000. The volume of increase has been surpassed in some previous months of the current year—in May, when the new issues aggregated $15,210,000, in April, with $14,325,000, and in March, with $21,518,000; but these earlier additions to the currency were the first-fruits of the new law of March 14, and the expansion was not expected to continue at any similar ratio. As the July figures show, however, there is little or no check to the movement. In the five months since the enactment of the law, the country's total bank circulation has increased $70,500,000. The magnitude of this addition to the circulating medium may be judged from the fact that it far exceeds the national banknote issues of any full year in the country's history, excepting only 1865 and 1866. It exceeds, in fact, the annual increase in all kinds of currency combined, in twenty-eight out of the thirty-five years since the civil war. In the second year named, the new bank circulation reached a total of $135,000,000. This is a striking figure; yet it will be observed that if the new issues of the current year continue at the rate reported for last month, the increase in circulation for the first twelve months of the law of March 14 will far exceed even 1866. Few expert observers ventured, last spring, to predict so huge a gain as this; yet it must be remembered that the relatively dull months of interior trade are now behind us, and that the harvest demand for currency, when bank issues would normally expand, sets in this month.

Thousands of our European immigrants come in by way of Canada, among them many who could never pass our strict inspection. So many have chosen this indirect route that the steerage business of lines touching at American ports is seriously affected. The united complaints of these steamship companies have brought the matter before the Treasury Department, which is now considering the serious problem of guarding a border of three thousand miles. There has long been an agreement with the Canadian Government that its inspection of immigrants bound for the United States should be strict and thorough. There has been, however, no means of enforcing such inspection, while nothing was easier for an immigrant having some defect in the eyes of the law than to announce himself as a candidate for Canadian citizenship. This usually sufficed to let him through, for it is still the policy of Canada to encourage immigration. Assistant Secretary Taylor of the Treasury Department and Commissioner-General Powderly of the Immigration Bureau have gone to Montreal to confer with Canadian officials about the whole matter. It is suggested by Commissioner Powderly that inspection points be established where the great railroad lines cross the border. The suggestion is a practicable one; and already, with almost suspicious alacrity, the Canadian railroad and steamship companies offer satisfactory assurance for the free return of rejected immigrants. The lines that get such inspection points will, of course, gain largely. Already there is a very pretty quarrel on between Canadian railroad and American steamship interests. It would be unfortunate if the fear of showing favoritism should confuse the whole issue, and leave us by default the old agreement.

Justice Davy of the New York Supreme Court has rendered a decision to the effect that an action for damages will lie when the "right of privacy" is violated. In this case a young woman's portrait was used as an advertisement without her consent, and a demurrer to her complaint has been overruled. The Court says that the plaintiff was not "within the category of what might be denominated a public character," and that there is no intrinsic improbability in the claim that she suffered mental distress because she was forced into this category. To desire a life of privacy, the Court continues, is entirely legitimate, and to print and post in public places as an advertisement the likeness of a person who wishes to avoid notoriety, may unquestionably injure the reputation as well as the feelings. Furthermore, if a lithographic likeness, owing to its beauty, is of great value as a trademark or an advertising medium, this value belongs to the person whose features are represented, and not to any person who chooses to make use of the likeness.

Some of the reasoning by which Justice Davy supports his decision is not altogether satisfactory. Privacy, he says, is regarded as a product of civilization, and was unknown and unsought among the barbarous tribes. The privacy of the home in every civilized country is regarded as sacred, and any invasion of it tends to destroy domestic and individual happiness. But many barbarous tribes are extremely particular on this point, and the customs of the Mohammedans are too well known to be referred to. On the other hand, it is only necessary to take up a copy of one of our sensational journals in order to see how far we regard the privacy of the home as sacred. It might more properly be said that civilization consists in giving the protection of the law to those customs and those feelings concerning privacy which the maintenance of the institution of the family in its perfection requires. Some years ago the Court of Appeals took the unfortunate position that a surviving relative could not suffer, in the eye of the law, because of the exhibition of a memorial of a deceased person which that person might have objected to if living. In that case all the surviving relatives of a woman of high position protested against the erection of a statue of her by an "art association" of dubious character; but the majority of the Court of Appeals held that the feelings of these relatives were injured only in their fancy. The judges of the lower courts, men not regarded in the profession as inferior in their abilities to those who reviewed their decision, gave substantial reasons for thinking such injuries not fanciful. But even the Court of Appeals admitted that living people had rights of privacy, and it is probable that Justice Davy's decision will be sustained.

The House of Lords has finally determined an interesting question under the law of copyright. During the year 1896 Lord Rosebery made a number of public speeches at meetings which reporters were invited to attend. The *Times* sent its representatives, who prepared reports of the speeches, which were then published. Other reporters were present, and also reported the speeches for publication. In 1899 a publisher, Lane, issued a book entitled 'Appreciations and Addresses by Lord Rosebery,' which was made up of verbatim copies of the *Times's* reports, the copying being without its consent. Lord Rosebery made no claim to copyright in his speeches. The *Times* then brought its action against Lane, alleging that he had infringed its copyright, it having duly registered its reports according to the requirements of the Copyright Law. There was no dispute concerning the facts, the sole issue being whether reporters of the public speeches of other people were authors or not, within the meaning of the statute. It was also admitted that the reports were practically exact reproductions of Lord Rosebery's words. They left out nothing they added nothing, and there was no paraphrasing or epitomizing or composing. The speeches might, in fact, have been reproduced by a phonograph, so far as any personal contribution by the reporters was concerned. An injunction was granted in the Chancery Division, but the decision was reversed in the Court of Appeal. Now the House of Lords, four judges against one, has definitively established the reporters' right, or that of their employers. Lord Rosebery, it was contended by counsel, was the author of his speech; but the reporter was the author of the report of his speech. One of the most effective arguments employed for the *Times* was that if a man had a perfect memory, and wrote out by heart with complete accuracy a speech which he had heard, he would have no protection, whereas, if he only gave the substance of it in his own words, he would be entitled to copyright. The case was extremely well argued, Mr. Augustine Birrell doing his best for the publisher, Lane; and the full report of the decision will be awaited with interest.

The exodus of the Jews from Rumania is explained by a correspondent of the London *Times* in a letter which reflects severely on the Government of that country. The independence of Rumania was established in 1878 by the treaty of Berlin. Article 44 of that treaty declares that "In Rumania the difference of religious creeds and confessions shall not be alleged against any person as a ground for exclusion or incapacity in matters relating to the enjoyment of civil and political rights, admission to public employments, functions, and honors, or the exercise of the various professions and industries in any locality whatsoever." In spite of this explicit provision and of the remonstrances of England, France, and Germany, the Rumanian Government has practically denied citizenship to the Jews. In 1879 about 800 Jewish soldiers were naturalized, but during the last twenty years less than 100 Rumanian Jews, members of a few wealthy families, have been enfranchised. Of the 260,000 Jews in the kingdom, most of them descended from those who have been settled there for generations, only 900 are now citizens. Even in their case the right is purely personal, and does not descend to their children. The Jews, being thus aliens in the eye of the law, are denied free education. There are 30,000 children of their race who are entitled to it, but only by paying fees are 3,000 of them able to obtain educational advantages which are free to Rumanians. The higher schools are closed to them, and they are hampered in establishing schools of their own. No Jew is permitted to hold a Government office, or a position in a hospital or on a railway. No Jew may be an architect, a veterinary surgeon, a dispensing chemist, or a lawyer. No Jew can be employed in the National Bank, or serve in the Chamber of Commerce, or hold a commission in the army. A Jew cannot sell tobacco or salt, and by a special act against peddlers 20,000 of these have been brought to the verge of starvation. They have been expelled from the country, and every obstacle has been placed in the way of their obtaining a living in the towns.

The Jews have until recently endured their persecutions with patience, and, while not enjoying the rights of citizenship, they have discharged its duties. They have performed military service, and fought in the campaign of Plevna. But the recent harvest failures have made their condition intolerable, and they are now trying to escape to the United States, to Canada, to Cyprus, even to Turkey, knowing that they can be no worse off, wherever they may go. This shocking spectacle has disgusted Europe and alarmed the Rumanian Government, which is trying to cover up its cruelties. It is said that the Rothschilds have let it be understood that that Government will find it hard to borrow money hereafter—a report which we hope is true. If the Jewish bankers will teach Christian rulers a few lessons in elementary humanity by cutting off their financial supplies, it will be an application of the "money power" which even the Bryanites might condone.

THE ALERT-PRESS FALLACY.

Memories are so short nowadays, and it has become so especially easy to forget the things we do not like to remember, that Imperialist newspapers may be surprised to be reminded at this late date of one of their glib assumptions of a year ago. This was that we had one sure bulwark against misgovernment or oppression in our new possessions. Grant that Congress might be apathetic, that the Administration might be indifferent, that our civil and military officials in our added islands might be supine, there was always the independent and enterprising press to fall back upon. Could there be injustice in the Philippines which the American journalist would leave for one day unwhipped? Could a Porto Rican be wronged in person or property without having the instant sympathy and championing of vigilant and fearless newspapers in this country? Put one side all sense of public duty; as a mere matter of news, as the basis of a sensational attack upon the Administration, every crookedness was certain to be exploited. Oh no, there would be no oppressive Imperialism anywhere in our new empire with the sleepless American press ready to hound it down.

That was the theory. We freed our mind about it when it was first produced. To us, it seemed only one of those "lounging opinions" which Lord Shelburne reproached the Duke of Grafton for holding. It was easy-chair and summer-afternoon philosophy. No man who bent his mind seriously to the problem would adopt it. One had but to think of the muzzling of the native Hindu press, and the general silence of English journalism as to all that concerns native aspirations or native wrongs in India, to see what was the far more likely Imperialistic course that our own press would pursue. Add its notorious fickleness, in response to a public as eager as the Athenian to tell or hear some new thing; its well-known inability to be indignant on any subject more than a week; its constantly changing personnel and management—and the alert press which was going to defend and rescue every imperilled new subject of ours was pretty certain to turn out a figment of the Imperialistic imagination. So we felt and said at the time.

We have now gone on with the thing long enough to take our bearings and ask how practice squares with theory. What do we see to be the facts? The special correspondents in the Philippines, Porto Rico, and Cuba have, almost without exception, been recalled. The press associations send but the most meagre dispatches, and those are censored. A few weeks since the editor of a prominent Havana newspaper was in this city, and declared that the New York press no longer took any interest whatever in Cuba. It was true, and he might have said the same of the press of the country at large, so far as the matter of Cuban news goes. The truth is, that this whole business of our new possessions is, from the newspaper point of view, an exploded sensation. There is nothing more in it. The biggest and reddest "scare-head" about the Philippines would not sell a copy. Our editors, like our reading public, wearily drop the entire subject. They take their cue from the sentiment which Lamartine once uttered from the tribune, "I warn the Chamber that France is being bored to death." If a bulwark of liberty, a champion of the oppressed, bores the public, why, it is his plain duty to give up those rôles at once. So reasons the press, wiser in its generation than the children of theoretic Imperialism.

To be more specific, of what smallest aid is the press in righting wrongs in the Philippines? The native newspapers cannot speak above a whisper; if they do they are suppressed, and a file of soldiers escorts their editors to jail. Of American newspapers in Manila, the less said the better. They live by advertisements of beer and whiskey. One sees with what zeal and courage they would expose the canteen abuse! In fact, their entire attitude towards the natives is one of antagonism and contempt. They would be the last resort in the world of a wronged Filipino. Our newspapers at home, as we have said, do little but languidly print the doctored Philippine dispatches. Where is there any persistent and rational discussion of the infinitely difficult questions of taxation, of education, of religion, of municipal and general government with which the Philippine Commission is wrestling? The American public is tired of it all. Naturally, therefore, the American press drops it all.

Which of our American newspapers know, or, if they do know, tell their readers, that great dissatisfaction with American rule now exists in Porto Rico, that the San Juan Chamber of Commerce is out with a strong protest against the new system of taxation and custom-house administration, and that the increasing discontent was what led Gov. Allen to make his sudden and hurried trip to Washington? What editorial bulwarks of liberty have the Cuban planters, who say that the United States is taxing them worse than Spain, at the same time that it is shutting them out of a market for their sugar and tobacco? Who among the noble champions of the Cubans in the American press even knows that the University of Havana, faculty and students, is up in arms against the recent military decree reorganizing and (it is alleged) demoralizing that institution? These are but specimen questions. The answer to all of them is that the American press cares for none of these things. It has other sensations in hand. That old orange is squeezed and thrown away. One short year has sufficed to show that this particular Imperialistic doll—this theory that our colonists would safely repose under the ægis of an independent and liberty-loving press—is stuffed with sawdust.

CURRENCY REFORM CONTINUED.

The Reform Club, through its Sound-Currency Committee, has issued an appeal for funds to carry on the work of currency reform from the point where it was left by the recent legislation of Congress (act of March 14, 1900), to the real and indisputable establishment of the gold standard. "Though much has been accomplished," it says, "the financial reforms advocated by this Committee and embodied in its enunciation of principles, are still incomplete." By way of showing its incompleteness the Committee publishes a tract embracing the recent article on this subject by Professor Laughlin, the recent address of Congressman Hill of Connecticut, the statement of Secretary Gage published in the *Journal of Commerce*, which was called out by Professor Laughlin's article, and the comments of the *Journal of Commerce* thereon. These papers, in the opinion of the Committee, point to the conclusion that the law recently passed, if administered by public officers who are hostile to it, by no means assures the maintenance of the gold standard.

It will be observed that the work proposed by the Committee does not relate to any point or subject in controversy among the friends of currency reform. It does not touch the question of "banking on assets." It does not relate to banknotes in any shape or form. It is directed solely to the defects of the present law regarding the gold standard. Those defects it may be well to point out again.

The chief defect in the act of March 14, 1900, is the omission of the law to make all contracts and obligations to pay dollars mean gold dollars. In this particular the only advance achieved is found in the clause which makes the new 2 per cent. bonds and the greenbacks and Treasury notes payable specifically in gold. The legal character and status of silver dollars and silver certificates remain unchanged. Private obligations remain unchanged. The old law of 1873 which made the gold dollar the unit of value is reënacted. This reaffirmation is not without moral effect, but its legal force is not augmented. Professor Laughlin showed that more than one thousand millions of the Government debt remains payable in "coin," under which phrase silver dollars are included. The House bill, for which that of the Senate was substituted, had contained a clause declaring "that all interest-bearing obligations of the United States for the payment of money, now existing or hereafter to be entered into, shall be deemed and held to be payable in the gold coin of the United States." This was stricken out by the Conference Committee, and it is one of the omissions which the Reform Club's committee desires to restore by future legislation. Another is the omission to make silver dollars exchangeable for gold dollars at the pleasure of the holder. The law declares it the duty of the Secretary of the Treasury to maintain the parity of value of all forms of money issued or coined by the United States—that is, parity with gold—but it gives him no new powers with which to execute the mandate. On this point Professor Laughlin says:

> "Suppose that Congress had ordained that the navy should have all the old powder exchanged for smokeless powder, and that it should have made it the duty of the Secretary of the Navy to make such exchange, but had provided no appropriation for this purpose, nor allowed any machinery for carrying out the plan beyond what existed before. Should we not regard this as something more than trickery? Certainly, it would be an insult to the intelligence of the public."

The law provides abundant means for replenishing the gold reserve when deficiencies occur for redeeming the legal-tender notes, and Secretary Gage finds a clause by which he is authorized to use the gold reserve "for all lawful purposes." Under this proviso he holds that it might be used to maintain the parity of all forms of money issued or coined by the United States. He is probably correct in this assumption. When a particular duty is imposed upon a public officer, he ought to construe all doubtful provisions of law in such manner as to promote the fulfilment of the duty. The immediate question, however, is not what a friendly Secretary would do, but what an unfriendly one might do.

The law, as a whole, contains provisions which constitute an advance toward the establishment of the gold standard, but it falls short of completeness in the particulars named. It is a good fair-weather law. Given prosperous times and a friendly administration of the Treasury Department, it will serve our needs in practice, although not perfect in theory. Even an unfriendly Secretary would be unable to disturb the gold standard by paying out silver dollars so long as the business of the country is active enough to absorb the silver dollars and certificates. In such case the Secretary, however unfriendly, could not get hold of enough silver dollars to do any real harm, although he might start a panic by attempting to force silver on the Government's creditors.

Under these conditions the Reform Club's determination to continue its sound-currency campaign is most commendable, and ought to be sustained by the contributions of the business men who have so liberally supplied it heretofore. No other agency has equalled it in furnishing to the public facts, arguments, and statistical information of value. No other can be named that possesses equally good machinery for disseminating such enlightenment.

THE ECLIPSE OF LIBERALISM.

As the nineteenth century draws to its close it is impossible not to contrast the political ideals now dominant with those of the preceding era. It was the rights of man which engaged the attention of the political thinkers of the eighteenth century. The world had suffered so much misery from the results of dynastic ambitions and jealousies, the masses of mankind were everywhere so burdened by the exactions of the superior classes, as to bring about a universal revulsion against the principle of authority. Government, it was plainly seen, had become the vehicle of oppression; and the methods by which it could be subordinated to the needs of individual development, and could be made to foster liberty rather than to suppress it, were the favorite study of the most enlightened philosophers. In opposition to the theory of divine right, whether of kings or demagogues, the doctrine of natural rights was set up. Humanity was exalted above human institutions, man was held superior to the State, and universal brotherhood supplanted the ideals of national power and glory.

These eighteenth-century ideas were the soil in which modern Liberalism flourished. Under their influence the demand for Constitutional Government arose. Rulers were to be the servants of the people, and were to be restrained and held in check by bills of rights and fundamental laws which defined the liberties proved by experience to be most important and most vulnerable. Hence arose the movement for Parliamentary reform in England, with its great outcome, the establishment of what was called free trade, but which was really the overthrow of many privileges besides those of the landlords. Hence arose the demands for Constitutional reform in all the countries of Europe; abortive and unsuccessful in certain respects, but frightening despots into a semblance of regard for human liberty, and into practical concessions which at least curbed despotic authority. Republics were established and Constitutions were ordained. The revolutions of 1848 proved the power of the spirit of Liberalism, and where despotism reasserted itself, it did so with fear and trembling.

To the principles and precepts of Liberalism the prodigious material progress of the age was largely due. Freed from the vexatious meddling of governments, men devoted themselves to their natural task, the bettering of their condition, with the wonderful results which surround us. But it now seems that its material comfort has blinded the eyes of the present generation to the cause which made it possible. In the politics of the world, Liberalism is a declining, almost a defunct force. The condition of the Liberal party in England is indeed parlous. There is actually talk of organizing a Liberal-Imperialist party; a combination of repugnant tendencies and theories as impossible as that of fire and water. On the other hand, there is a faction of so-called Liberals who so little understand their traditions as to make common cause with the Socialists. Only a remnant, old men for the most part, still uphold the Liberal doctrine, and when they are gone, it will have no champions.

True Liberalism has never been understood by the masses of the French people; and while it has no more consistent and enlightened defenders than the select group of orthodox economists that still reverence the principles of Turgot and Say, there is no longer even a Liberal faction in the Chamber. Much the same is true of Spain, of Italy, and of Austria, while the present condition of Lberalism in Germany is in painful contrast with what it was less than a generation ago. In our country recent events show how much ground has been lost. The Declaration of Independence no longer arouses enthusiasm; it is an embarrassing instrument which requires to be explained away. The Constitution is said to be "outgrown"; and at all events the rights which it guarantees must be carefully reserved to our own ctiizens, and not allowed to human beings over whom we have purchased sovereignty. The great party which boasted that it had secured for the negro the rights of humanity and of citizenship, now listens in silence to the proclamation of white supremacy and makes no protest against the nullification of the Fifteenth Amendment. Its mouth is closed, for it has become "patriot only in pernicious toils," and the present boasts of this "champion of human kind" are

> "To mix with Kings in the low lust of sway,
> Yell in the hunt, and share the murderous prey;
> To insult the shrine of Liberty with spoils
> From freemen torn, to tempt and to betray."

Nationalism in the sense of national greed has supplanted Liberalism. It is an old foe under a new name. By making the aggrandizement of a particular nation a higher end than the welfare of mankind, it has sophisticated the moral sense of Christendom. Aristotle justified slavery, because Barbarians were "naturally" inferior to Greeks, and we have gone back to his philosophy. We hear no more of natural rights, but of inferior races, whose part it is to submit to the government of those whom God has made their superiors. The old fallacy of divine right has once more asserted its ruinous power, and before it is again repudiated there must be international struggles on a terrific scale. At home all criticism of the foreign policy of our rulers is denounced as unpatriotic. They must not be changed, for the national policy must be continuous. Abroad, the rulers of every country must hasten to every scene of territorial plunder, that they may secure their share. To succeed in these predatory expeditions the restraints of parliamentary, even of party, government must be cast aside. The Czar of Russia and the Emperor of Germany have a free hand in China; they are not hampered by constitutions or by representatives of the common people. Lord Salisbury is more embarrassed, and the President of the United States is, according to our Constitution, helpless without the support of Congress. That is what our Imperialists mean by saying that we have outgrown the Constitution.

THE ORGANIZATION OF EDUCATION.

One of the advance steps which seem most likely to be taken in education in the immediate future is the organization of educational forces. We have colleges and universities to spare, with constantly increasing enrolments and rapidly swelling endowments. The efficiency of the various classes of preparatory schools has grown with rapid strides during the present generation. What seems to be demanded now is an organization of these multitudinous agencies, in accordance with some system which, while not destroying proper individuality or ambition, will bring about greater harmony and coöperation, and rid the educational field of not a little lack of uniformity and of waste of energy due to needless duplication.

There has been already a considerable number of hopeful steps in this direction. The Commission of Colleges in New England, the New England Association of Colleges and Preparatory Schools, and such special organizations as the New England History Teachers' Association, have done much in the way of unifying the work of colleges and secondary schools, particularly in the matter of methods of instruction, college entrance requirements, and the conditions of various academic degrees. An association of colleges and preparatory schools for the Middle States and Maryland has been working along the same lines, and has lately set itself to organize and maintain a board for the conduct of college entrance examinations. There are similar associations for the Northwest, and, we believe, for other sections of the country, while the National Educational Association, now a highly organized and efficient body, has already, through the reports of some of its committees, profoundly stimulated discussion of educational problems.

What is needed now is a systematic gathering up of the results which these various bodies, each working, to a considerable extent, independently of the others, have attained, and a systematic attempt to apply their demonstrated principles to the work of organization over a given territory. There are several topics with which any such attempt would particularly concern itself. First in importance, doubtless, must be placed the much-discussed subject of uniform college entrance requirements. The point that now needs attention, however, and the one most to be considered in a general scheme of organization, is not the terms in which requirements are stated, but the uniformity with which the prescriptions are interpreted. Theoretically, at least, we have now practical agreement as to the kind and amount of work a boy shall do in each of the subjects which go to make up his "fit"; but the standards of examiners in testing his attainments vary widely. In one college the hard subject to pass is Greek, in another mathematics, in another history; yet the catalogue definition of requirements is, very likely, the same in all. After giving all due weight to the personal equation, it is still very apparent that, in education as in other things, only a beginning has been made when a "scheme" has been drafted, and that it is the spirit, rather than the letter, of the law that usually counts for the most.

The experiment undertaken by the Association of Colleges and Preparatory Schools for the Middle States and Maryland will be watched with special interest in this connection. This association proposes to secure, by means of a joint committee from colleges and fitting schools, the preparation and use of uniform papers for entrance examinations. The papers will be drawn up and corrected by the committee, or under their supervision. Whether such a plan is feasible or not, or whether it may not be defeated by the great amount of labor involved in carrying it out, experience must show, but the project is a bold move in the direction of which we have been speaking—that, namely, of reducing to the lowest terms the wide variations of judgment among college examiners.

The same crying need of uniformity arises in fixing the content of college and university courses. There would seem to be no insuperable difficulty in securing practical identity at this point. In departments such as languages and mathematics, the ground covered in a given "course" might easily be made substantially the same in all institutions in which that course is taught. In other departments, where library or laboratory facilities affect the extent and quality of the instruction, the courses of different institutions might well be arranged so as to bear a known and ascertainable value in relation to each other. The underlying feeling of the average man, particularly the average parent, that a term or year of work at Brown or Amherst or Bowdoin ought to stand for the same as a term or year at Williams or Tufts or Dartmouth, has too firm a basis to be much longer ignored. At present, each institution regulates the matter for itself, often by a rather crude rule of thumb. Harvard scrutinizes the content of a "course," as well as the record of the student who has taken it, and by this means reaches a conclusion as to how much, on its own scale, the offered work is worth. Other institutions, including many small colleges, rate the work of similar institutions, course for course, the same as they rate their own. Neither follows what any of the others recognizes as a general principle, and the result is only a working compromise.

Consideration of entrance requirements and the content of college courses involves necessarily the conditions for a degree, in regard to which, also, there is still wide diversity. It is the solution of problems of this sort that educational organization has next to undertake. The demand is not for machinery for the sake of a system, but for conservation of energy for the sake of the student and the public. There are difficulties in the way, of course; some of them, no doubt, serious. It will not be easy to devise a plan of coöperation in which universities, colleges, and preparatory schools shall each find place and work harmoniously to definite ends, but something of the sort has certainly come to be a pressing desideratum.

THE PRESENT NEEDS OF ITALY.

The tragic death of King Humbert leaves the Italian state in a deplorable condition. The very ongoing of the present order may depend upon a good understanding between the new King and his Parliament and people. Division and subdivision have been the only constant principles of action in Italy since the departure of the French from Rome. Unification had been an idea of the dreamers, of the Dantes and Petrarchs and Leopardis; and when the unification of Italy became a fact, it appeared too suddenly and with too much adventitious aid from outside. The old provincial divisions have never really disappeared. Between Piedmontese and Neapolitan what a gulf! How different a Tuscan from either! Italy is wrestling with a parliamentary system, without possessing that sense of party loyalty and responsibility which can alone give weight and stability to party government. The Deputies at Montecitorio dissolve into contending factions with ever-shifting alliances, so that nothing like consistent party policy is discoverable. A kingdom where local divisions are most strongly marked, groans under a Napoleonic bureaucracy which it distrusts and has hardly yet learned to understand, while in the struggle between Church and State the State appears to lose.

In the web of corruption and cross-purposes which has enveloped the Government of Italy, the kingship has been the one bright strand. Two kings of heroic courage, of generous heart, and of open mind have represented all that was admirable in the national ideal. If loyalty to the kingship goes, the last informing idea of the present order goes with it, and the time will be ripe for revolution. This is mere sentiment, some will say; but it is by such sentiment that nations live. It is unfortunate that Victor Emmanuel III. is not what his compatriots call *uomo simpatico;* it is generally believed, however, that he has unusual abilities, and there is hope that he may be, like his father and grandfather before him, moderator of the cruel tempest in which the Italian state drifts almost pilotless—"nave senza nocchiero in gran tempesta."

The parliamentary system has relatively failed in Italy, but the nation has suffered more from internal corruption and from bad finance than from simple maladjustment of political system to national temperament. The official class, not excluding the army, is notoriously corrupt. We know on indubitable authority that at Naples a paltry fee will secure for an attorney the papers delivered by his opponent for the private information of the court. The Deputies enrich themselves at the public expense, and the principle of *combinazione* is all-powerful. The result is that there exists in Italy a profound contempt for its own political institutions. "They [the Deputies] are all corrupt, or quickly become so," said an intelligent proprietor last spring to an American, "and the only remedy is general abstention from voting." It must be a desperate condition indeed that suggests, even as a whim, the protest of folded hands and silent lips. *Giusti son due*, said Dante of the Florentine leaders of his time; it were an optimistic Italian that would admit as many just leaders to-day.

Oppressive taxation is the crying evil of Italy. Here lie the greatest perils to the state and, as well, the greatest possibilities of reform. The peasants of the Apennines, a thrifty, laborious race, live chiefly on chestnuts and cheese; in Romagna—the garden spot of Italy—the workers suffer peculiar and distressing diseases because they cannot afford salt, heavily taxed as it is, for their *polenta;* in the farming districts of southern Italy, we are credibly informed, the taxes amount to 50 per cent. of income from all sources. The selling of small properties for defaulted taxes of less than 100 lire ($20) is of common occurrence. The unification of Italy was at best an expensive necessity, and a corrupt administration and an ambitious military and naval policy have made the burden doubly galling. These taxes are paid by those who are least able to bear them. The peasant pays on his land, and pays day by day for every pint of milk or bunch of vegetables he carries to market; the wealthy citizen is often favored by statute (luxuries are curiously enough generally exempted from taxation as "non-productive"), and more by collusion with the assessor. Northern Italy, which in 1891 possessed 48 per cent. of the national wealth, pays less than 40 per cent. of the taxes, while southern Italy, holding 27 per cent., contributes 32 per cent.; so unequal is the distribution of a burden grievous enough in any case.

It is in this matter of taxation that Italy must make or break. The average Italian takes his politics lightly enough, but he knows well that he is taxed, and taxed cruelly. The principle of revolt is not in him, still less that of reform, but actual distress and hunger may bring about the real "bread riots" that the disorders of May, 1898, professed to be, unless reform first come to relieve an intolerable situation. Reasonable honesty in administration, average justice in taxation, passable economy in expenditure—this is all that the Italian state requires for its safe continuance. The alternative is clearly enough dismemberment and a return to the old condition of independent states and communes. But we cannot believe that the work of the Risorgimento is so to be nullified. There is a remnant working for the revivification of the body politic; and with this despised remnant of *intellectuels*, of whom Signor Villari is the type, the future of Italy largely lies. The public life, like the art and literature of Italy, has been in danger of perishing for want of ideas. The old ideas of the unification have worn out. The idea of reform and the civic courage to carry it into effect are the only hope of the Italian nation. The King, from the Constitutional limitation of his powers, can contribute little directly to this work; but by representing in his person the solidarity of national feeling, through which alone reform can come, he may indirectly contribute much.

JACOB DOLSON COX.

Thirty years ago this very month which witnesses his decease, Mr. Cox, then Secretary of the Interior, received from President Grant such treatment as seldom falls to the lot of an upright Cabinet officer. One McGarrahan, who had for years been endeavoring in the courts to establish a fraudulent claim to California mining lands really belonging to the United States, and had four times been repulsed in disgrace by the courts, was working upon Congress, where his success was no greater. However, his claim had, in 1870, been again referred to the House Judiciary Committee, and he had as counsel Lewis Dent, the President's brother-in-law. Meanwhile the New Idria Mining Company lodged an application with the Interior Department for a patent to the same lands. Through the Supreme Court of the District of Columbia, promptly and sharply overruled by the United States Supreme Court, McGarrahan procured an injunction against the application taking its natural course. This failing, he induced the Chairman of the Judiciary Committee to request Secretary Cox to suspend proceedings in view of possible Congressional action in favor of the pretender. The Secretary, upon this impertinence, asked the advice of Attorney-General Hoar, who replied that the rights of the New Idria Company were determined by law, and were not subject to requests from judiciary committees or even from Congress itself. Accordingly, Secretary Cox ordered the Land Office examiners to pursue their usual routine, with due notice to all parties interested.

It was now midsummer, and President Grant had gone to Long Branch, whither the McGarrahan interest pursued him, and drew from him an executive order to Secretary Cox to disregard the Attorney-General's advice, and to leave the matter in the hands of the Judiciary Committee. The Secretary, who had in vain urged that Grant return to Washington and submit the controversy to a special meeting of the Cabinet, gave plain notice in his reply that such interference on the part of his chief, if persisted in (and this was not the first instance), would compel him to resign.

The occasion was not long in coming. The Pennsylvania election was approaching, and the Republican party managers made their customary appearance in Washington to blackmail the clerks of the departments in a manner now prohibited by law. The Interior Department, however, had been put by Secretary Cox, of his own motion, and long before any civil-service reform regulations had been enacted, on a merit basis—no dismissals except for incompetency, no appointments except after examination. He accordingly forbade a levy fixed in the case of each clerk or class by the party collectors, with threat of dismissal for non-compliance. From this moment he was doomed. Simon Cameron and Senator "Zach" Chandler led a powerful movement to oust the independent Secretary. The President, on his part, displeased at finding his irregular, semi-military interference resented—moreover, already seeking a renomination—gave no support to Secretary Cox, who in October handed in his resignation, following Hoar, who had been previously forced out. "Stalwart" Republicans like Col. Forney of the Philadelphia *Press*, acting as Grant's mouthpiece, insinuated "personal reasons" for the resignation, and then attacked the retiring officer for his "sickly sentimentality" in taking the civil service out of politics, as well as for his action in the case of the McGarrahan claim.

Secretary Cox's virtual dismissal at the behest of the machine was vigorously censured by the press of the country without distinction of party. President Woolsey of Yale and his professors held a meeting to swell the chorus of reprobation. In fact, the incident of Secretary Cox's political martyrdom materially conduced to the ultimate triumph of the reform movement, then struggling into being. It was still fresh in the public mind when the opposition aroused by the progress of official corruption under Grant's first Administration engendered the luckless Cincinnati Convention of 1872. Gen. Cox was a natural candidate of the reform party, with which he had publicly identified himself. A lawyer by profession, he had had civic experience as State Senator of Ohio, when with Hayes and Garfield he virtually directed legislation; at the close of the war he had been elected Governor. His versatile talent had found free play as executive head of the miscellaneous Department of the Interior. His services on the battlefield had been conspicuous and highly meritorious and successful. He had sacrificed his Cabinet position in defence of pure government. He suffered, however, the fate of most martyrs, and his leadership was not entertained by a body which ended by nominating Greeley.

A partial return to public life was made in 1876, when the Sixth Ohio District elected Gen. Cox to the House of Representatives at Washington by the largest majority ever known. It was his hope that he might thus do something to sustain President Hayes. He did not serve a second term, whether it was not assured him, or whether the time had come for him to choose for or against politics as a career. He felt the helplessness of the new member, unused to the ropes. He saw how genuine debate is handicapped by the vastness of the House chamber and by the mob of inattentive members. Perhaps he had had enough of strife, for his character was essentially easy and amiable, however resolute and soldierly. Save for one speech on the stump in 1880 in support of his old associate Garfield, he retired altogether from politics even as a free lance or as a contributor to public discussion in the press. He came near being drawn into the currency debate, for he had been persuaded by his friend Dana Horton's arguments for the remonetization of silver; but he held aloof. He had, on quitting the Cabinet, resumed the practice of the law in Cincinnati. He then removed to Toledo to become President of the Wabash Railroad. On the expiration of his Congressional term, he was made President of the Cincinnati University, and afterwards Dean of the Law School. A graduate of Oberlin College in 1851, he returned three years ago to that institution to end his days, having made a most agreeable arrangement by which his private library was added to that of the College, and he provided with a corner of his own, where his literary work could be pursued amid delightful surroundings. Here he completed, among other works, his military memoirs now in course of publication by the Scribners, and he entered upon his vacation last month with as much buoyancy and expectation as ever. It was his summer custom to join one of his sons in cruising in the Gulf of Maine, with headquarters at Magnolia, Mass., and in that place he died after a brief weakness on August 4.

We have purposely, in these "strenuous" days, begun our notice of a truly noble man and rare American at a point unrelated to his military career, which, with his various writings, will chiefly cause him to be remembered by posterity. He was, however, one of the first to raise troops and take command in the civil war, passing (after distinguished action on many fields from West Virginia to Maryland, Tennessee, and North Carolina) from a brigadier-generalship to a major-generalship, in which capacity he earned the honors of the stubborn contest with Hood at Franklin. Of the war he became an historian in his monographs on 'Atlanta,' 'The March to the Sea,' 'The Second Battle of Bull Run, as Connected with the Fitz-John Porter Case,' 'The Battle of Franklin,' and finally in the memoirs already referred to, of which he was reading the proofs when stricken down. He had been for many years, and to the very last, the military critic of books for the *Nation* and the *Evening Post*, and after the death of John C. Ropes he was easily the highest authority with reference to the events and the strategy of the civil war. He wrote with great fluency, seldom amending his proofs, and maintained to the end the vigor of thought and expression which marked his prime. His fairness was remarkable for a nature so hearty as to be almost fervid. If his judgment of Fitz-John Porter seems unwarranted, or at least not that which will finally prevail, his admiration for Grant as a soldier was unimpaired by his experience with him as a politician-ridden President. For Sherman, too, he had a high regard, in spite of a certain brusqueness towards subordinates; for, as Gen. Cox used to remark, when the fight was raging no man could be more Chesterfieldian, and he concluded that, on the whole, he should prefer, of all commanders he had known, to serve again under Sherman.

Gen. Cox did not go with his party the full length of its opposition to President Johnson, and this contributed in some measure to his dropping out of local politics in Ohio. He had a dread of negro suffrage, or rather he had a strong desire that the white race should shape the destiny of the country. No more than others who have essayed it could he suggest a solution of the reconstruction problem wiser or more stable than that adopted by Congress. In 1865 he proposed a scheme of segregation, but it found no echo. He witnessed with satisfaction the downfall of the carpet-bag régime, to which President Hayes gave the *coup de grâce* that President Grant forebore to deal, though seeing it to be inevitable. He knew that through or over existing forms the wealth, intelligence, and force of character of the South would assert itself and regain control of the government. The extent to which this process has actually gone on, with the growth of lynching and political terrorism such as shocks us to-day, could but seem to him deplorable.

The distinction of Oberlin College was that it welcomed not only female students—a prime innovation—but colored. Of such an institution Gen. Cox was proud to be both an alumnus and latterly a trustee. He married a daughter of President Finney, once famous as a revivalist preacher, and made his last home in a spot endeared to both by the tenderest associations. His father was a master-builder, whose home sometimes accompanied his contracts, and was actually in Montreal when the future Gen. Cox was born on October 27, 1828. Mechanical aptitude "ran in the family," and produced among the numerous brothers a turbine wheel on which great expectations, not realized, were based. Gen. Cox was devoted to the microscope, and among his other diversions was a thorough study of the cathedrals of Europe. He was the father of Kenyon Cox, the well-known artist and art critic. A daughter married a son of Gen. Pope.

We should do ourselves injustice if we withheld from this imperfect tribute to Gen. Cox the note of personal bereavement. For a generation we have enjoyed with him an intimacy characterized by utter frankness and entire mutual esteem through all vicissitudes of opinion; enlivened by constant intercourse by letter, in connection with that attached and cordial collaboration which has lent so much weight to the reviews of this journal; and refreshed by visits, "alas! too few," in his annual east-westward journey. In a time of decadence we feel keenly the loss of one who threw all his weight in the scale of that elder Americanism which, to look only at his own State, has undergone so woful a substitution—for Chase, and Giddings, and Wade, for Hayes and Garfield, of Grosvenor and Foraker, of McKinley and Hanna.

AMONG THE NURAGHI.

SASSARI, SARDINIA, June, 1900.

"Illæ robustissimorum saxorum maceries, quæ adhuc Noraces vocantur, et ad instar rotundarum turrium, in insulæ locis agrestibus et montuosis, passim conspiciuntur." Thus wrote John Francis Fara, Bishop of Bosa, in the sixteenth century, in 'De Chorographia Sardiniæ' (first edition, Turin, 1835); and beyond the time of Fara, as scholars tell us, similar references are found through Diodorus Siculus up to Aristotle himself. In more recent times, students, local or other, serious travellers, or mere inquisitive tourists (like the present writer) have found in these strange remains of a vanished race an interest none the less great from the fact that, saving their very obvious and tangible existence, almost every point bearing on their origin or their purpose is still wrapped in the haze of obscurity and conflicting conjecture. So numerous, indeed, are the monographs on this subject that the stranger soon finds his Italian vocabulary enriched with the uninviting terms *nuraghagrafo* and *nuraghologo*, to neither of which, if he be wise, will he dare to pretend.

As the railway train proceeds along the main Sardinian line from Cagliari to Sassari, the eminences and hillsides are frequently observed to be topped by massive, conical towers of stone, built in horizontal courses of rough-hewn blocks without mortar or cement, which diminish in size up to the flat, truncated top of the structure. When Macomer, the nodus of the island, is reached, the whole district appears fairly studded with these *nuraghi;* and from here to Nuoro, situated near the great craggy outposts of the Gennargentu chain, or mountain centre of Sardinia, is consequently the most favorable field for study, whether long or short. Some of the best-preserved remains, as well as a few specimens of another character, are likewise in this vicinity. Near the small *paese* of Bolotaha, close by, Neigebaur (Turin, 1855) professed to have ascertained the existence of no less than two hundred nuraghi. It has been estimated that the total number contained in the island is upwards of three thousand; on this point most of the authorities agree. But by far the clearest impression of the vast numbers of these towers, in good condition long ages ago, is to be obtained from an admirable map of a small corner of Sardinia made by the Cav. Filippo Nissardi, Inspector of the Museo Nazionale at Cagliari, unfortunately as yet unpublished. The specific marks indicating nuraghi, whether ruined or intact, are in some places so close together as to remind one of the "Temperance Map" of London, in which each red spot stands for a tavern. As Dr. Nissardi's map represents the "nuraghography" of only the northwestern angle lying to the left of Porto Torres and Alghero, it is much to be regretted that the authorities have not yet seen fit to enable him to complete the survey of the island before the disappearance, through carelessness or deliberate destruction, of many more of these interesting remains.

The typical nuraghe, as the better-informed reader doubtless knows, consists usually of two vaulted chambers, one above the other, the upper one being reached by a spiral passage, so narrow as to admit but one person at a time, and rarely high enough to allow one to stand erect. This is, however, by no means a universal rule. A short distance from Tempio in Gallura, for instance, there stands on the property of the Azara family an extremely interesting specimen, which the kindness of its owners allowed the writer to see under the very best conditions. It originally had two stories (the upper one now gone), but the ground floor is reached through a high vaulted corridor, leading by openings, right and left, to two chambers of the ordinary type, while from the left-hand room a small third chamber is reached through a low aperture. Behind these again, and still included in the eight-foot wall of the nuraghe, lies a fourth room, almost entirely ruined, the ingress to which is undetermined. Another noteworthy feature of this structure lies in the fact that, like others in Gallura, it is built of the hard gray granite of the Limbara district, largely used for construction purposes in the town of Tempio itself. Its lines are consequently much less regular than usual, and the courses less horizontal. The builders obviously selected blocks with approximately smooth cleavage, for no sign of tooling has been detected here. One of the larger blocks, taken almost at haphazard, proved on measurement to be five and a half feet long, four feet wide, and two and a half feet thick. Differences in structure have been variously explained, as will subsequently appear; the variety of material employed (hard calcareous stone, trachytic porphyry, volcanic rock, and so forth) depended on the nature of available building stone afforded by the neighborhood. Thus, the celebrated "Black Nuraghe," seen from the railway carriage window, near Ploaghe, between Chilivani and Sassari, is built of lava, fairly abundant in the region. As regards height and girth, it need but be said that the larger towers measure some fifty feet from foundation to top of platform, with a diameter of about eighty feet at the base; scores of them are on a much smaller scale.

It forms no part of the purpose of the present article to attempt the serious solution of difficulties over which archæologists are still at strife; the outside dilettante is only too often disposed to rush in where the specialist treads with wary foot. Suffice it to say that authorities on "nuraghology" see in these structures a variety of different ends. Thus, to take a few of them chronologically, Stephanini ('De Veteribus Sardiniæ Landibus,' 1772) holds them to be trophies of victory; Madao ('Sarde Antichita,' 1792) argues in favor of a *sepulchral* hypothesis; La Marmora, the classical authority on Sardinia (1840), looks upon the nuraghi as essentially connected with religious worship; Canonico Giov. Spano (1854), also an eminent nuraghologist, discovered grounds for considering them to be dwellings of the primitive inhabitants of Sardinia ("case e abitazioni antiche di famiglie aggregate in società"), while others, again, have come to the conclusion (Zanardelli, 1899) that the primary intention of the nurag-builder was strictly defensive, during ages of "Homeric struggle." In all this controversy, not always conducted, be it said, in the dispassionate spirit which is misguidedly supposed to mark the objective aloofness of science, only one writer of eminence seems to have been capable of taking the strictly logical position of the empirical school. Dr. Ettore Pais of Naples. in a most excellent monograph ('La Sardegna prima del Dominio Romano,' Rome, 1881), printed among the archives of the Reale Accademia dei Lincei, for the first time suggested that the purposes of the three thousand or more nuraghi in the island of Sardinia need not have been uniformly identical. Variety in structure might very well be brought about by diversity of purpose; and, indeed, the same nuraghe might well, in those primitive anti-specializing times, have been designed with more than one aim in view; further, as Dr. Pais points out, it is not easy to find two that coincide in all the details of their plan. There was, continues the learned writer, a close connection between the fortress and the temple in prehistoric times, or, as one might say, *entente cordiale* between the gown and the sword. This unlikeness of structure, in which La Marmora saw only a deeper mystery than ever, and which another sought to account for by assuming a difference in resources or social standing of their builders, appears to Dr. Pais, on the contrary, the obviously simple solution, which he offers.

He thus sums up his inference in the following widely synthetic proposition: "Il Nuraghe . . . devrebbe considerarsi come la forma non solo prototipica ma esclusiva di tutta l'architettura dell' antico abitante della Sardegna." This position is not easy to dispute. It is strengthened by the fact that all endeavors to classify the nuraghi in view of determined differences of purpose have thus far been unsuccessful. A very general division separates them into three kinds—single, linked, and grouped; but, according to several authorities, it rarely happens that nuraghi are found in complete isolation, and the linking and grouping can easily be explained by reference to the character of local situation rather than by specific differentiation in the matter of determinable purpose. When, for example, three closely neighboring hills offer favorable positions for construction, it is more than likely that towers will be found on each one. If the eminences form an *enfilade*, the nuraghi are linked, while a bunch, or cluster, results from closer juxtaposition of the respective sites.

The principal point which forced itself upon the notice of the writer will be noted presently; but, among the many valuable bibliographical resources placed at his disposal through the courtesy of the librarians at Cagliari and Sassari, he could hardly fail to mark the singular insistence laid by most of the contestants in turn upon this or that minor, not to say niggling, detail, in the endeavor to establish an hypothesis. Taking but one example, we may say that an opponent of Spano's very plausible theory of the nuraghe as a dwelling based his principal arguments on the absence of light and air in the interior of the structure, as well as on the general smallness of the means of ingress, which rarely admits of one's entering upright. Now when, in the name of all ethnological experience, did the cowering savage ever object to creep into his primitive lair? It surely argues a *parti pris* to ignore the fact that the tent of the North American Indian and the Esquimau snow hut are still commonly accessible only on all fours—sometimes in the more humiliating posture of the serpent. And as for sunlight and oxygen, on the necessity for which the critic in question dwells at much length, it may well be asked whether the inhabitants of ground floors and cellars on the Castello hill of Cagliari, in their narrow streets, enjoy much more of these blessings than did their remote ancestors, the nuraghe-builders? Scores of families in southern Italy live in one darksome room, the window and door of which are but meagre concessions to civilization; and, it may be added, the demand for light and air is one of the first signs that the material conditions of *modern* civilization are at last looked upon as essential. In this respect, Italy is still a laggard in the race, for the ordinary Italian bedroom is, at night, an air-tight camera obscura, while the terrors of the railway-carriage, with windows closed and curtains drawn, have become too proverbial for mention. It should also be said that, even to this day, the Sardinian shepherd frequently finds the nuraghi perfectly habitable. If one may be permitted another illustration, it is found in connection with the vexed question as to whether the nuraghi were all originally, as now, truncated near the top, or rounded off with a bulbous dome. On this point, a leading authority, basing his argument on the use of the word θόλος in a passage from a work commonly assigned to Aristotle ('De Mirab. Mundi'), of which the genuineness has, however, been contested, concludes in favor of truncation. But, says the skeptic, how do we know that Aristotle ever saw a nuraghe, or any one who had seen one? And, further, since θόλος signifies not only *camera fastigiata rotunda*, but *ædificium rotundum*, it appears to the outsider a somewhat arbitrary assumption to restrict the meaning to the former alone.

Preserving still the attitude of one untrained in the psychological (and logical) procedure of archæology, the writer confesses to some surprise at the comparatively faint stress laid by the majority of inquirers on what presented itself to him as the most salient general feature in connection with these mysterious towers. Apart entirely from the facts of their great numbers, of their massive strength, of the admittedly extreme rarity of their complete isolation. and of their almost invariable situation on eminences commanding a more or less extensive fertile district, little attention seems to have been paid, even by Gen. La Marmora, to their markedly favorable strategical positions. Over and over again, whether from the rapid glimpse through a railway-carriage window, or during the more leisurely and studious ramble in the country, the nuraghi appeared *en échelon* along the jutting points of a range of foothills, backed by the stronger support of mountain-ranges which, in those distant days, must have been well-nigh impassable for an invading enemy. If we take further into consideration the geographical structure of Sardinia, which offers, on the map, a rugged succession of mountains on the east side, from the Straits of Bonifacio to the Gulf of Cagliari, while the western swath, though partly hilly, opens out into the rich Campidano and other plains, it seems difficult to resist the conviction that *one* purpose at least of the builders was that of defence. One need not conclude that a synthetically organized scheme of fortresses was conceived from the outset. Rather, we should say, as the island became more and more populous, successive positions were selected, till at last, over a vast range of country, the harvests were commanded and protected from this stretch of hill-towers presenting their openings mostly to the south—not only the quarter on which the safest harbors were found, but also the direction from which hostile incursions were by far the most likely to come, This impression was intensified on seeing, in the Museo Nazionale at Cagliari, a very complete, if partly conjectural, restoration of the original ground-plan of a nuraghe, inductively put together by the Cav. Filippo Nissardi as the result of years of study. It represents the central tower flanked with smaller turrets, and the line of circumvallation described by a massive wall which, according to the hypothesis, enclosed the primitive settlement; while outside the boundary of this defence was the necropolis, so often illustrated in Sardinia in the *Tumbas de los Gigantes*.

Of the æsthetic effect of the nuraghi in the landscape, little notice seems to have been taken. Photographs can give but a faint idea of the impressiveness of these lonely masses of cyclopean blocks, dominating the plains, and presenting, under the afternoon sun, the most superb deep orange of their flanks, covered all over with stonecrop and other lichenous growths; while the base, and often the top of the structure, blossoms out in weeds and wildflowers. There is, however, one result derived from careful photographing, namely, the correction of a defect common to almost all illustrations with pen or pencil. Such pictures usually represent the lines of construction much too regularly. Both from the cheap woodcuts of Sardinian monographs, and from the elaborate engraving of La Marmora's atlas, which accompanies his great work, the reader would be led to expect rectilinear effects resembling the lines of an Eddystone lighthouse; while the real beauty of these towers seems rather to consist in their constant preservation of due and graceful relations between height and diameter, without insisting on strict regularity of upright and horizontal lines. The undeniable practical superiority of photography in this respect is further enhanced by comparing results in the writer's possession with cuts from La Marmora (steel) and Tyndale (wood) of a singular row of vertical cones of stone, known as the *pedras marmuradas de Tamuli*, a few miles to the west of Macomer. Two or three of these bear, a few inches from the top, protuberances roughly resembling the human female breast. In La Marmora, the beautifully executed steel engraving shows a sort of cartridge broken out with two warts; and Tyndale's illustration is entirely misleading.

If the end for which the nuraghi were originally destined is still open to controversy, no less doubt continues to hang about the question as to who built them. The philological speculations of Petit-Radel and others, the strictly Biblical turn of Spano's argumentative ethnology, and the still more *elaborate historical researches of contemporary scholars tend to inspire the unlearned* with due respect, but also with prudent reserve, for all these doctors do most hopelessly disagree. There is nothing in these buildings, save the nature of their construction, the bronze tools or instruments and the grotesque idols (or *figurines*) discovered in fairly large numbers among the ruins, that can serve to decide approximately the epoch of building or the builders. It seems possible, according to the best authorities, to connect the nuraghi historically with the Talajotz (or Talaxots) of Mallorca, which resemble them in shape and position. And a leading archæologist, of another order, told the present writer that towers of similar construction may still be seen among the almost unvisited islands of the Aegean. The ordinary traveller will be quite content to remain unfixed in the nebula of hypothesis; for him, it is sufficient to know that, in the dim distance of that prehistoric past, there lived on the island a race capable, like the Sardes of Vittorio Emanuele's day, of asserting their rights to have and to hold what their industry had made their own. But this Sardinian determination to preserve, in the midst of Italian unity, a distinctive ethnical and social character has also the advantage of fostering the prehistoric tradition of consideration and hospitality to the stranger. While warmly thanking Dr. Arnaldo Capra (librarian at Cagliari) and Dr. the Rev. Filippo Nissardi, Vittorio Finzi (librarian at Sassari), together with their assistants, for much more than official courtesy and kindness, the writer would also include in his gratitude the many unnamed Sardinians —chance acquaintances, innkeepers, and peasants—whose attentions stimulated the interest of study by reducing the difficulties of travel in a beautiful country little trodden by the tourist.

P. T. L.

THE PARIS EXPOSITION.—VI.

THE FOREIGN FINE-ART SECTIONS.

London, July, 1900.

If all roads lead to Rome, it is certain that all good pictures—by Continental artists—find their way to the two Salons. The foreign sections at the Grand Palais des Beaux-Arts, if I except the American, have little to show that is not known, little that can come as a surprise. The work has almost all been seen in Paris at one time or another, though, of course, now that it is collected together according to countries, certain national characteristics are more sharply marked. Art is not an affair of nationality, it is true; but only the greatest artists remain uninfluenced by accidents of race and climate and environment.

As far as space is concerned, Germany, Austria, and Great Britain fare no better than the United States. Unable to make an exhaustive display, the Germans and Austrians seem to have determined to show how an exhibition should be arranged. Their rooms are interesting, less because of what is in them than because of their scheme of arrangement and decoration. There is no doubt that Mr. Whistler, when he startled London by paying some attention to the color of the walls and the distribution of light in the gallery of the British Artists who had made him their President, was the first to explain that the beauty and effect of an exhibition as a whole should be considered no less than the quality of individual pictures. The same principle was accepted by the International Society, of which he is now President, and the two shows at Knightsbridge have given an example to the world. Certainly, they have had their influence on the Germans, who contributed to them, and who now, in Paris, have built up a series of beautiful rooms, decorated, one in green, another in red and gold, separated by a little hall with alcoves and marble columns. There are rich hangings, wide couches are set out as in a drawing-room, green plants in tubs, bronzes, and pedestals are scattered here and there, and you have a pleasant sense of not being in an exhibition gallery, but in a palatial apartment where pictures happen to be among the treasures. The only trouble is that the scheme of decoration is too gorgeous, it is overdone, as it is also in the German pavilion. Ornament is piled upon ornament, with heaviness as the result. But, on the other hand, the pictures gain by the arrangement. They have an air of being something fine, the careful hanging points to their importance, and I was struck with the fact that it lends distinction to the most commonplace. A portrait that even at the International in London was a blot on the otherwise beautiful walls, here becomes not only unobjectionable, but almost impressive.

However, it is just as well the collection should borrow importance somewhere, for, in itself, it has no great merit to recommend it. There are but two small watercolors by Menzel; Stuck's labored mysticism has long since become tedious; the series of portraits by Lenbach prove how seldom his work is worthy of his reputation; there is a not very distinguished Liebermann, a still less distinguished Von Uhde, and, really, when I have said this, I have said all that need be said. Klinger stays away, and so does Arnold Böcklin, who, by now, seems less Swiss than German. There is no sign of the Munich Secession, and, as in the other sections, no effort to introduce new men. Altogether, the decorations, despite their splendor, cannot conceal the poverty of the work for which they are the background.

It is the same in the Austrian section, though here the arrangement, while as charming, is far simpler; in color, a cool gray that is very pleasant and restful to the eye. But if there is no heaviness, no exaggerated gorgeousness, the detail in the frieze, in the hangings, in the general scheme, has a touch of the peculiar affectation of ornament that has gone forth from England, chiefly by way of the studio, all over Europe. I shall never forget the house of an aspiring Belgian to which I went last summer, where the paper on the walls, the carpets, the chairs, the tables, the pictures, the brasses—everything was modelled apparently upon the English "Arts and Craftsmen," with, as result, an aggressiveness, a jumpiness, a jumble of ornament that made one long for the restraint and severity of the old mahogany and horsehair period. There is nothing of this kind in the Austrian rooms, but only the tendency, the warning of what might happen were the accepted schemes carried a little further. On the cool gray walls, the pictures are hung with the utmost taste, well spaced, and never crowded. But there is not one you can feel any particular desire to look at a second time. A room is reserved for Hungary; and the Hungarians, with that eagerness which outrivals the Americans to do everything on the biggest scale on earth, have striven to get as many canvases as possible in the given space, and these cover the wall in a solid mass from floor to ceiling. Nor have the artists neglected any of the fads or fashions of the day. Their pictures are impressionistic, religious, mystic, symbolical—all the many other things that pictures have been at the Salon for the last decade; while it is amusing to find, in the corner set apart for Croatia and Slavonia, a perfect outburst of sunlight and symbols. In a word, I discovered nothing in the Austro-Hungarian section that seemed in the least individual, or personal, or even interesting, except the watercolors of Ferdinand Andri—strong, vivid studies of peasants that reveal some originality of observation as well as very good drawing.

Great Britain, on the other hand, has been as indifferent to the appearance of its galleries as to the quality of the pictures that fill them. You might think the object had been, after showing in the English pavilion the masterpieces that British painters—Hogarth, Gainsborough, Reynolds, Raeburn, Turner, Constable—once produced, to astonish Paris by the spectacle of a Royal Academy of to-day on the banks of the Seine. "A collection of Academicians and mediocrities," English critics themselves have been describing the work sent to represent British art; and the hanging is as unintelligent, as crowded, as atrocious in every respect as at Burlington House. The fact is, most of the members of the Committee in charge were Academicians or dealers, or admirers and patrons of the Academy, to whom British art—official art—means the Academy and nothing else. But it is not necessary to point out now—I have pointed it out often enough before—how much else there is in Great Britain besides the Academy. The Glasgow School, for instance, started a very distinct movement, and what is there from Glasgow? A couple of portraits by Mr. Lavery, one very badly hung, a picture by Mr. Walton, skied—it occupied a place of honor at the Knightsbridge show a year ago—and that really is about all. Nor is the existence of the New English Art Club recognized; there is no suggestion of this little group who were among the first to turn to France for their inspiration and standard. Nor is space made for several independent landscape-painters who might be leaders of a school were not their own originality so obviously borrowed from France. Mr. Edward Stott is here and well hung, but Mr. Priestman and Mr. Hill are banished to the ceiling, and the others are absent. It is enough to say that, of all the notable outsiders, Mr. C. H. Shannon alone appears, and he, unexpectedly, is on the line, where his portrait of himself, despite its old-masterly affectation and the clumsiness of drawing that so far has marred all his work, asserts itself with that distinction which the Committee evidently tried hard to exclude. It is easy to understand, when you look round these rooms, so amateurish and childlike compared to the other sections, why the English, amazed at the manifestation of their own shortcomings, are indignant that two of their Academicians who might have joined with Mr. Watts and Mr. Orchardson to help things a little—Sargent and Abbey—should prefer to show with the Americans.

In a few other sections interest centres upon one or two men. In the Italian, where the space, so limited with the Americans, is far in excess of the exhibitors' needs, Boldini and Segantini overshadow everybody else. I have spoken already of Boldini. His pictures hang together, so that their effect is strengthened. Besides the "Whistler" there are two portraits of women and one of Comte Montesquiou, the latter already seen in the Salon. His people live on his canvas; you feel the nervous joy of the painter, his excitement in his own creations, and, if you happen to know one of his sitters, you recognize the truth with which he always renders every characteristic of feature or pose. In fact, in his portraits of women, truth borders upon caricature; what he intends for elegance in a great lady at times comes very near degenerating into meretriciousness. But that does not detract from the fluency of his painting, his unusual power of observation, his technical accomplishment, his entirely personal standpoint. The drawback to his work is a certain effect of thinness, of over-freshness; his painting seems to need long years to tone and mellow it. But, when those years have passed, I imagine his pictures will stand comparison with the old masters better than even his admirers now believe. Segantini is a painter of as decided a personality, and his pictures, too, have been grouped together. There is a series of three large Alpine landscapes upon which he was at work just before his death, unrivalled in their realization of the clear atmosphere, the hard glitter, the dazzling snow peaks, the sharp outlines of the Alps, and in their grandeur of composition. They are not finished; in one the clouds are still heavy white lumps of paint, and you are therefore too conscious of that curious technique which he developed for himself. As a rule, a painter's methods broaden with years and his accumulation of knowledge and experience. But it was just the other way with Segantini. There is one of his early pictures here, put in boldly and with the greatest breadth. But in these last landscapes the canvas is covered with a minute mosaic of color that makes you marvel the more that, with such technical mannerisms, he could express so much dignity, such a feeling of bigness in his mountains and pastures.

The Spaniards, in their work, show the same desire for sensation on a large scale, and, in a measure, the same skill you find in the Salon. It is evident that most of the exhibitors have studied in Paris. Pinazo Martinez does try, but with indifferent success, to reproduce the types and sunlight of Spain. Sorolla y Bastida, who has carried off a gold medal, succeeds much better; his canvases have decided vigor, but they are nothing more than able Salon *machines*. And what else is there? Madrazo grows vulgar with years. Fabrés, in a colossal composition, seems, to his own misfortune, to invite comparison with Velasquez; Paredes and Salinas do their best to continue the subject and manner of Casanova; Garcia y Ramos paints anecdotes with the assiduity of, though with more ability than, the British Royal Academician; Checa is sensationalism itself; and there remain but the watercolors and drawings by Vierge, all well known, that are worthy of the great traditions of the country. In Portugal, again, you discover chiefly echoes of Paris and the Salon, except for the portraits of Columbano, who has studied Velasquez and Whistler, and whose work is, at least, a tribute to his taste in preferring great masters to clever leaders of passing movements.

If Spain is Vierge, Switzerland is Schwabe. Here and there are artists who deliberately set to work to develop whatever they think characteristic of their country, for never before was nationality accepted as such a responsibility. Perhaps it is Hodler who carries the mediæval spirit the furthest, striving almost too hard to infuse into it the new life of a vigorous personality. There is Roederstein, whose portraits are a tribute to Holbein, and are more striking here than in the Salon. But, otherwise, everywhere is the influence of the Paris studios and schools. Take Amiet as a typical example; he, like the American, has been painting snow, but, instead of rendering it as he sees it in Swiss valleys and on Swiss mountains, his one idea, apparently, is a decorative arrangement that will suggest vaguely many things he, last of all, would be able to define. Even Schwabe, whose personality is distinct enough to dominate any borrowed elements in his designs, has found part of his mystical inspiration in the problems and subjects that have been engrossing the Parisian for the last ten years.

It is another matter in the Scandinavian countries, where individuality in the artist and fidelity to the national spirit in his work are the battle-cry. The banner of freedom of Ibsen's young man has been waved in art as in literature. But the Scandinavian painters long since took the world by storm by their vigor, amounting almost to brutality, their nationality, flung down by the brush as a gauntlet, their love of strong color and bewildering sunlight. But of late they have added little to the message already brought. For all the efforts at a renaissance of the younger men, for all the violence of Willumsen, Christiansen, and the others, it is Kroyer who still towers by his rendering of character, as in the portrait of "Edward and Nina Grieg," by his force and energy and knowledge, as in that admirable portrait group, the "Séance de l'Académie Royale des Sciences," though Skovgaard is amusing and as Danish as well can be in his versions of old legends; and Hammershöff, in the gray interiors that are dull in themselves but delightfully painted; and Nielson, in his comparatively quiet portraits, and, above all, Tûxen, in a sketch for the picture of the Coronation of Nicholas II., brilliant, suggestive, rich in color. In Sweden, where methods are less exaggerated, it is Zorn who towers with his powerful portrait of the King. In Norway, Thaulow, whose landscapes hold their own in an International Exhibition in Paris as in London. Werenskiold also stands out conspicuously; he has a portrait of Ibsen, whom so many other Norwegians have painted, a harmony in gray, and a study in character that lives in one's memory after far more pretentious canvases have been forgotten for ever. And here, as in the American section, there are numerous studies of snow, unmistakably truthful, but, unlike the American, with none of the more important pictorial qualities. The impression you carry away from these rooms is of a people too engrossed with truth to remember that there is such a thing as beauty: one reason, perhaps, why their painters, like their poets and dramatists, have failed to reach the highest distinction of all.

Force, in which a primeval brutality still lingers, also marks the Russian section. It is the more difficult to give names because much of the work is not familiar to me, and much of it was not numbered when I was in Paris, though I have no doubt this has been attended to since. But I remember only too vividly my sensation almost of dismay before the mistaken energy displayed in some of the canvases—especially before one in which four coarse, heavy women, presumably peasants, in flaming red, were on the point, it seemed to me, of flinging themselves straight out of the coarse green landscape which, by all the rules of the game, should have contained them well within itself. But in the portraits by Serov, as yet a trifle barbaric, this brutality is gradually being tamed; among them was a lady in yellow, sitting on a couch, that Sargent would not be ashamed to own. It was interesting also to see an attempt to revive the gorgeous old church decorations in pictures of saints against splendid backgrounds of gold, while in the Finnish group the preoccupation of Gallen with the 'Kalevala' and national legend and Jaernefelt with the national landscape lifts their work to a very different plane; both are far more original than Edelfelt, who is so much better known in Paris. There may be nothing of supreme merit, but there is much that bears promise for the future.

In countries like Belgium and Holland you return to the strongholds of tradition. Whatever primitiveness there may be is wholly a revival. In Holland all the men who have become famous as the Dutch Romanticists have their place; except Matthew Maris, who, in his mysticism, has of late years become too reserved to show anywhere. I have often before remarked that not even in Holland do the Dutchmen appear to such advantage as occasionally in the smaller galleries of London, and I think some previous knowledge of them would be necessary to appreciate their true rank among the exhibitors in Paris. Israels, James and William Maris, Mesdag, Bosboom, Ter Meulen, are all here, and the younger artists, Breitner, Witsen, De Bock, Thérèse Schwartz; but, solid and sober and learned as their work is, it does not make the impression that might have been expected. Belgium does better, though Belgium, nowadays, is a safe harbor for every passing fad and fashion. A national movement, as in Scandinavia and Russia, does not exist. The good work—and the average is unquestionably good—bears the hallmark of Paris. The mysticism, or symbolism, that may have gone to Paris by way of Félicien Rops, who is very poorly represented, has come back to find exponents in Fernand Khnopff and Léon Frédéric. Impressionism has few more devoted disciples than Émile Claus, and so it would be easy to go through the list. Even Evenepoel, with his hard, but sincere and genuine portraits, savors of Paris; and also Struys and Delannois, though they may select essentially Belgian subjects. The greatest modern master Belgium can boast, Alfred Stevens, has few followers, though a fine series of his pictures explains once more how much is to be learned from him, how distinguished a place he holds among the painters whose nationality is the merest accident.

There are other sections—Bulgaria, Servia, Rumania—that have rooms and alcoves apart. A gallery, classed as Section Internationale, is a reminder that Turks and Armenians are hard at work. And, most melancholy spectacle of all, Japan competes directly with the western nations in the Grand Palais des Beaux-Arts. The Japanese trained in European schools is commonplace itself; in his landscapes, his portraits, his studies of the nude, he manages to repeat only the most tedious trivialities and weaknesses of the artists whom he does not understand. It is altogether a pitiful display of feebleness, and the worst of it is, that so vitiated has he become by western methods, he covers the walls of one room, from floor to ceiling, with the kakemonos, which, at home, he respects too much ever to show more than one or two at a time. There are also colonial displays in odd buildings, which, I confess, I made no effort to see, discouraged by one forlorn little picture from Cuba hidden away in the United States rooms. But I saw enough to convince me that, in the last ten years, no new masters have appeared; that, except in the United States, originality is rare; and that, however strong may be national movements in choice of subjects and motives, the technical inspiration of the world still comes from Paris.

PRACTICAL POLITICS.

To THE EDITOR OF THE NATION:

SIR: Your comments on the "Reasons for a Third Ticket" will be read with great interest, as you have stated the matter in its most plausible form. Yet you seem to lose sight of the fact that the moment is unique and exceptional. At other Presidential elections we have deemed it highly important to express ourselves upon questions of tariff or finance. We have had faith to believe that if any of these questions were decided wrong, the decision would be reversed. Now we are to pass upon a question which may affect the policy of this nation for a century, perhaps a thousand years; whose decision may influence subtly but profoundly the aspirations of mankind. To be critical, at such a moment, even to hesitate, seems almost trivial. A man does not discuss a question of domestic discipline when his house is on fire.

The independent voter is a believer in practical politics; he seeks by his vote and influence the best attainable, even if it is not ideally the best. For the coming election, if he is an Anti-Imperialist, he adopts the words of Mr. Boutwell: "The party must be overthrown." To that end all other matters must, for the time, be subordinated. It is quite probable, as you suggest, that some political party or some individual may profit by the exigency. That has often happened, and the superficial observer has often misinterpreted it. For example, Mr. McKinley believed that the overwhelming majorities of 1896 showed an unmistakable reaction in favor of a high tariff!

Undoubtedly, as you intimate, it would be very impressive if all who disapprove of both political parties could be counted by themselves, but the vast majority of such voters dislike, even under ordinary circumstances, to appear neutral upon important issues. Furthermore, to vote one of the party tickets does not indicate any danger of an extinction of the spirit of independence. It may even be claimed that a higher degree of independence was required of a man who voted for McKinley in 1896 than of one who voted the third ticket. It emphasizes the rebuke which we administer to an existing policy that we do not insist on an ideal opposition party or an ideal candidate.

In a word, the independent in the fateful battle that is being fought is going to take sides. The issues are so important, especially from the standpoint of the Anti-Imperialist, that he cannot answer to his own conscience by remaining neutral. He grants that there is need of a new party, but he denies that the moment is opportune. Such a movement may have his cordial support after the election, but not before. He sees a paramount issue, not made such by the wording of any political platform, but by the trend of events. A third party never had so little excuse for existence; and if set in motion, it is almost certain that the number of its adherents at the polls will show that the independent has been too much interested in one issue which is transcendent, to give attention to others which can wait.

FRANK W. LEWIS.

BOSTON, July 31, 1900.

[Long experience has made us very familiar with the argument from inopportuneness. In all perplexing Presidential campaigns, subscribers and readers who have gone with us in preaching the doctrine of independence, have reproached us with not taking sides as election day drew near. We were at the same time assured of their "cordial support after the election."—ED. NATION.]

WHAT BRYAN HAS DONE AND MAY DO.

To THE EDITOR OF THE NATION:

SIR: From the letter enclosed, it appears that Secretary Gage is of opinion that Congress, in its last financial bill, did not provide for the redemption of the silver dollar, as it has done for fractional currency. *Quære:* Is it now in the power of the President, without violating law, to place the country on a silver basis?

My recollection is that Mr. Carlisle, when Secretary of the Treasury, wrote a letter in which he stated that the silver dollar was redeemable in gold at the Treasury. If Mr. Gage is right, it seems to me that the monetary standard of the country is still in a precarious condition; and can be shifted by the will of the President. If enough silver dollars should be put in circulation to pay customs duties and internal revenue taxes, there would be no gold in the Treasury with which to pay the public debt, and we must sink to the silver standard. One of the arguments urged in favor of Bryan is that his election could do no harm to our financial credit, because the gold standard has been established by law, and that he would be powerless until the political complexion of the Senate is changed. But it seems to be still a matter largely of executive discretion, as it was during Mr. Cleveland's Administration, whether we shall stay on the gold basis or drop to a silver basis. In order to get rid of the Philippine trouble, ought we to take the free-silver nostrum? Is not the remedy worse than the disease? The descent to the shades of Avernus is easy—*Sed revocare gradum; . . . Hoc opus, hic labor, est.*

It is certainly a poor recommendation of a candidate to say of him that he can't do any harm, although he wants to do it. I have read in the *Nation* the Socratic dialogue in which Senator Hoar is represented as making no distinction between the virtue of one who is a principal in a crime and one who is passive and looks on, but does nothing to defeat it; and Socrates condemns McKinley for negotiating the Spanish treaty, and excuses Bryan for not exerting his influence to prevent its ratification. But in the immortal dialogue in which he confutes the sophist, Socrates holds men not only responsible for the evils they do, but for those they do not use their power to prevent being done. If he had been guided by the maxim that it is wise to be silent when it is dangerous to speak, he would not have died a martyr to Truth. Plato could not have recorded his speech to the judges who condemned him, and men would not weep over the page of the 'Phædo' that tells of the scene at sunset in the dungeon,

"When, Athens! here thy Wisest looked his last."

But Bryan was active in securing the adoption of the treaty that expanded us. He advised its ratification without amendment. If a crime was committed, Bryan is an accessory before the fact. In his great argument on the trial of Knapp for murder, Mr. Webster demonstrated that one who stood by and kept watch was equally guilty, as an accessory, with the one who struck the blow. So far as their record in Congress is concerned, parties are *in pari delicto* on the Philippine question. Senators who took Bryan's advice and voted to ratify and expand, are still the trusted leaders of the Democratic party.

The treaty was not to become effective until Spain received the twenty-million purchase money. Every Democrat in Congress, I believe, voted for the appropriation. It would have been no breach of public faith to have refused it. Spain would then have kept the islands. A man who voted the money to buy these islands and relieve Spain of the burden of governing them, is now estopped from complaining of Expansion. Then Democrats, equally with Republicans, have supported the Administration by voting money and men to carry on the war in the Philippines. It is at least a hopeful sign that the Philadelphia Convention evaded the issue of permanently holding them by declaring that "we are in favor of the largest measure of self-government for the Philippines consistent with their welfare and our duty." Every man opposed to incorporating Asiatic possessions into our political system can endorse that declaration. Logically, it means our abandonment of the Philippines. JNO. S. MOSBY.

SAN FRANCISCO, July 25, 1900.

TREASURY DEPARTMENT,
WASHINGTON, March 26, 1900.

DEAR SIR: I am in receipt of your letter of the 19th inst., in which you say you enclose a clipping from one of the San Francisco papers. The clipping referred to was not found with your letter.

You say you do not understand why the Government is able to maintain the silver dollar on a parity with gold, unless it is redeemable in gold just as the greenback is.

Perhaps the controlling reason why the Government is able to maintain the silver dollar at a parity with gold is that a wide avenue for its use was provided when the silver dollar was made receivable for public dues. Being good for 100 cents in payment of customs and internal-revenue taxes, just as the gold dollar is, there was established a sort of indirect redemption in gold (or its equivalent, customs dues or taxes) where the number of silver dollars is limited. Collections from customs and internal revenue exceed $500,000,000 a year. The Government having given its pledge that these silver dollars will be received for public dues, it is therefore in the power of the holder to obtain the equivalent of gold, substantially, by paying such silver dollars for taxes.

Respectfully yours,
L. J. GAGE, Secretary.

Mr. John S. Mosby, San Francisco, Cal.

[Neither the new currency law (March 14, 1900), nor any other law, makes the silver dollar redeemable in gold. Our recollection is that Secretary Carlisle, in response to an inquiry, said that he would redeem silver dollars in gold if it became necessary in order to maintain parity between the two. This he would have been justified in doing under the clause of the Sherman Act (July 14, 1890), which declares it to be "the established policy of the United States to maintain the two metals on a parity with each other on the present legal ratio." In other words, a Secretary friendly to the gold standard would find means under existing laws to keep the silver dollars at par, while an unfriendly one might not. It does not follow that the unfriendly one could upset the gold standard by paying out silver dollars in large quantities. Large quantities are not generally within his reach. Nearly all are absorbed in the circulation of the country, and, as Secretary Gage shows, any quantity that the Treasury would be able to pay out under prosperous conditions of trade and industry, could be turned over to the Government at par in payment of duties and taxes. Of course, the conditions of trade and industry are liable to change. It is conceivable that bad times may come, and with them shrinkage in the demand for silver dollars and silver certificates, so that the receipts of the Treasury shall be composed exclusively of them. In such an event the silver standard would establish itself, unless the Secretary should take positive steps to avert it. —ED. NATION.]

INTRINSICATE.

TO THE EDITOR OF THE NATION:

SIR: My reply to "C. A. H." is, that I showed, in my short letter, all that I undertook to show, namely, the occurrence of *intrinsicate*, and bearing a signification not warranted by the Italian *intrinsicato*, in a writer earlier than any of the Elizabethan dramatists by whom, so far as is at present known, it was mentioned or adopted. Of Italianisms and other foreignisms which, whether midwifed dead or destined to live, were, in the sixteenth and seventeenth centuries, candidates for introduction into our language, I have amassed a large collection, perhaps some day to be published.

F. H.

July 24, 1900.

Notes.

Among the fall publications of G. P. Putnam's Sons will be a uniform edition of George Borrow's works, edited and annotated in part by Prof. W. I. Knapp, Borrow's biographer; and a novel, 'Ned Myers; or, A Life Before the Mast,' discarded from the revised edition of Fenimore Cooper's works in 1859.

McClure, Phillips & Co. have in preparation an authorized translation of Leroy-Beaulieu's 'Rénovation de l'Asie,' recently reviewed in these columns, with an introduction by Henry Norman; 'The Archbishop and the Lady,' a story by Mrs. Schuyler Crowninshield; and 'Yankee Enchantments,' by Charles Battell Loomis.

A writer of no little promise, Miss Josephine Preston Peabody, will issue a second volume of verse, 'Fortune and Men's Eyes: New Poems, with a Play,' through Small, Maynard & Co., Boston.

The Proceedings of the remarkable Conference in May last, at Montgomery, Ala., of the Southern Society for the Promotion of the Study of Race Conditions and Problems in the South are to be published on August 15 by the B. F. Johnson Publishing Company, Richmond, Va. The price will be one dollar before publication, and $1.50 afterwards. The publication of these discussions at the South itself is a hopeful sign of the times, along with the very existence of the Society. While much that was reactionary found expression, much also of the talk was what would have been called "incendiary"—*i. e.*, humane—"when we lived under the King [Cotton]."

The persistently anonymous author of 'Elizabeth and her German Garden' pays her American admirers the compliment of a "new edition with additions"—something like a quarter in bulk (Macmillan). The humor, the style, the picture of foreign manners, the impressions of nature (there is a passage on page 118 that one might expect to meet in Turgeneff), will long attract readers to this slight but charming production. The August *Critic* identifies "Elizabeth" with Princess Henry of Plesse (Miss Cornwallis West), and gives a portrait of her.

Mr. Gollancz's little "Temple Classics" (Dent-Macmillan) proceed with 'Tully's Offices Turned out of Latin into English by Roger L'Estrange,' the editor following in the main the first edition of 1680. The translator's preface is no small part of the worth of this little volume. His protest or scruple against the use of literary masterpieces as text-books for parsing and construing has not ceased to be repeated by the wise for more than two centuries. Meanwhile, teachers have failed to profit by his advice to drench their pupils with (in this case) the 'Offices' in English before "the scholar be put to hack and puzzle upon them by snaps in the original." The student's small loss of interest as explorer would be more than offset by the general view and comprehension which the daily task without such preparation seldom gives.

In March last we extended a welcome to the first of the four volumes of the 'Cyclopædia of American Horticulture,' by Prof. L. H. Bailey and his assistant, Wilhelm Miller (Macmillan). The second is now issued, embracing the letters E—M. The large number of pen-drawn illustrations in the text are supplemented by a few striking photographic plates of full size, including a frontispiece group of portraits of prominent American horticulturists. The pen-drawing of the late Asa Gray which accompanies the article upon him is much inferior to the foregoing group. Plate xiv. shows Washington's garden at Mount Vernon as it looks to-day. The rude sketch-maps of States show more or less broadly the chief horticultural areas; in Massachusetts, the Cape Cod cranberry belt lies over against the strawberry region; apples are at the opposite extremity, in Berkshire, and again in Worcester and Middlesex Counties.

'The Memoirs of the Baroness Cécile de Courtot,' translated from the German by Jessie Haynes (Henry Holt & Co.), are not published in the form of an original autobiography, but have been compiled from letters and a diary by Moritz von Kaisenberg, the great-grandson of the lady to whom the letters in question were addressed. The Baroness de Courtot, a lady-in-waiting to the Princess de Lamballe, survived the Terror and lived into the period of the Consulate. Her letters to Frau von Alvensleben, which form the chief material for this volume, were written from Paris between 1800 and 1803. Her sufferings during the days of the Convention are, indeed, told, but in the words of Frau von Alvensleben's diary. The most important part of the record, which is personal rather than political, begins shortly after the *coup d'état* of Brumaire, and deals with Parisian society in the time when the First Consul and Mme. Bonaparte were engaged in conciliating the good will of all groups, cliques, and parties. The Baroness de Courtot received invitations to Malmaison, and saw enough of fashionable life to furnish her with several subjects for character sketches. The most romantic part of the book, however, is the story of her engagement to the Vicomte Hector de Treilissac in the early part of the Revolution, his astounding success in rescuing her from the guillotine, their separation until after the return from Egypt, and final marriage. Altogether these memoirs must be held to rank well in the department of minor biography. The translation seems a good one, but the proofreader has been too careless.

A Norwegian writer, Clara Tschudi, who has already published biographies of Marie Antoinette and the Empress Eugénie, adds a volume 'Napoleon's Mother' (Dutton), to the vast bulk of Napoleonic literature. The English translation is by E. M. Cape. A good contemporary account of Letitia Bonaparte was written by the eminent army surgeon Jean Dominique Larrey but latterly she has found little favor with writers and editors of memoirs. She is usually credited with colossal greed and an unpleasant partiality towards certain members of her family. In the present sketch these hard lines of character are a good deal softened by the emphasis which is placed upon Le[illegible] self-control in prosperity and misfortune. Certainly no wild animal ever looked after its young more carefully than she watched over her children during the struggles of their infancy and early days. The strength of her affection for her younger half-brother, Cardinal Fesch, is also a point in her favor. The most interesting part of her life is that which lies before the establishment of the Consulate. She never trusted in the permanence of Napoleon's political fabric. Miss Tschudi has collected considerable information regarding the period of poverty and hardship, which will appeal to readers of biography no less than to students of history. There are so few women in modern times to whom the title, "Mater Regum," can be applied, that a well-prepared sketch of Letitia Bonaparte will hardly fail to secure its audience.

Every one familiar with the late Edward L. Pierce's Memoir of Charles Sumner, in four large volumes, will understand how natural and proper was the remark he is said to have made when he first heard of the intention to include a biography of Sumner in the American Statesmen Series: "All the facts will be found in my work." There was, in truth, no chance for Mr. Moorfield Storey to display originality in research in his 'Charles Sumner' (Houghton, Mifflin & Co.), but there was a rare opportunity to rearrange the topics and the colors and to analyze Sumner's impressive character. The opportunity has been improved to a considerable degree, but the main effort seems to have been to condense into a little more than four hundred pages a record of a busy public career covering about a quarter of a century. While Mr. Storey has relied almost entirely upon Pierce's investigations, it is nothing less than amazing that he has not even mentioned either Pierce's name or his generous literary monument to Sumner. The book lacks vivacity and a literary touch, such as are apparent in every chapter of Mr. Morse's biographies, however much he leans upon others for his facts. Mr. Storey gives us a good summary, a well-proportioned brief.

'Muscle, Brain, and Diet: A Plea for Simpler Foods,' by Eustace H. Miles (Macmillan Co.), is a record of the personal experience of a brain and muscle worker, not a physician, who comes to the conclusion that for himself, at least, meat and stimulants are harmful and not healthful. It is conscientiously written and contains suggestions of value. To some persons the suggestions of a private individual carry a kind of conviction which the writings of the trained scientific observer do not inspire; to us, however, it appears that the handling of such a subject is attended with so many difficulties that the very best training is none too good for it, and we cannot admit that the author demonstrates his right to speak with authority.

The "Captivi" is far the best of the comedies of Plautus for undergraduate classes, and the Allyn & Bacon College Latin Series is sensibly strengthened by Prof. Elmer's edition, which has just appeared. Prof. Elmer is very conservative in his treatment of the text and makes a plausible plea for the manuscript readings in many cases where previous editors have thought it necessary to emend. We cannot see, however, that this laudable conservatism made necessary the relegation of his own textual criticism to a special appendix, and the use of this special appendix for the citation of authorities for statements made in the main commentary is unfortunate. A considerable amount of repetition is apparent in the notes, perhaps justifiable in most cases from the pedagogical point of view, but it was hardly necessary to state in three separate places that Plautus frequently seasons his Greek materials with Roman allusions, Terence only rarely. The reference in the Introduction to Hrotswitha of Gandersheim as an "imitator of Terence" perpetuates a tradition which would not last long if some one would try to point out the evidences of imitation. The associates of Hrotswitha read Terence to their moral detriment, as it seemed to her, and she tried, with Christian materials, to write poems which would take the place of the pagan comedies. As one might expect from Prof. Elmer, the use of the subjunctive in Plautus receives minute attention. He naturally insists on his own views, which are well known to Latinists through the *American Journal of Philology* and other publications, but the student is allowed to know, through references to Bennett and others, that these views are not universally accepted by competent philologists. Of the work as a whole one may fairly speak in terms of high commendation.

We have received from Henry Frowde three catalogues of the exhibits of the Oxford University Press at the Paris Exposition, the first being of the Educational. Those of Paper and Binding are noticeable for very attractive photographic illustrations, first, of the University paper-mill at neighboring Wolvercote, which the antiquarian Hearne notes in operation in 1728 by John Beckford, "famous for making paper." Here is made that wonderful Oxford India paper which effects such incredible saving in bulk and weight as is demonstrated by several object-lessons, with the aid of the camera. "Yapp bindings" are the specialty of this press, and are shown in many beautiful examples. No. 172 in the catalogue is the poetical works of Whittier, and the "unique design" represented is as elegant as it is un-Quakerlike.

The twelfth volume of Mr. Charles F. Lummis's *Land of Sunshine* published in Los Angeles, Cal., combines the issues from December, 1899, to May, 1900, inclusive. The contents show a steady evenness of worth and interest, and the illustrations cover a wide range. Among the portraits are to be remarked the fine head of Dr. Edward Robeson Taylor, the competent translator of Hérédia's verse; William Keith, the landscape painter *par excellence* of the Pacific Coast; E. A. Burbank, whose gift of Indian portraiture, as evidenced here, old Catlin would have been the first to recognize, and receives here the praise of so high an authority as Mr. Lummis. Other more familiar faces are those of Edwin Markham, President Wheeler, who writes of his University of California, and the late Elliott Coues, shown also in a group with George Parker Winship and others. Mr. Winship contributes an article on the discovery of the Colorado. Mr. Lummis characterizes in his racy manner Mrs. Charlotte Perkins Stetson and other representatives of Western letters, and in many departments plies his fluent and interesting pen. Pursuing his "fixed policy," which is to make his magazine 'entertaining, if possible, but valuable anyhow,' he concludes his translation of Fray Zarate-Salmeron's *Relación* concerning New Mexico and California, 1538-1626, and publishes entire a version of Fray [illegible]

Velez de Escalante's story of the Pueblo Rebellion of 1680. Joaquin Miller's lines on Oom Paul's birthday, and the capitally illustrated papers on Southern California birds, by no means exhaust the rich store of this volume.

It seems like a myth to read that there are nearly three hundred women quietly studying at the University of Berlin. This is certainly the beginning of the end, and the few colleges of the Eastern seaboard of the United States which still hold out against the pressure of the times will surely not be able to do so long. Clark University, with the large new endowment which will without doubt be secured to it by the liberality of the people of Worcester, will enter upon a brilliant career free from middle-age anachronisms, and Princeton and the Johns Hopkins will then stand in an unenviable isolation which they will surely hasten to bring to an end. No one can make head against the feeling of his age when he is without any well-grounded reason for his idiosyncrasy.

The seventh International Congress of Navigation was held at Brussels in July, 1898, and the report of Elmer L. Corthell, delegate of the United States, has recently been published as a Congressional document. It describes the organization of the Congress, the first at which both inland and maritime navigation was discussed, and gives abstracts of the reports presented. The first of these are on canalized rivers, and treat of questions relating to the raising of existing weirs, the consolidation of weir foundations, the utilization of the fall of water at weirs as a motive force, and the resistance to the movement of boats. Problems concerning modes of mechanical traction, single-lock gates, means of securing the impermeability of the bottom and sides of a canal, and the mechanical raising from reach to reach of the water supplying a canal are discussed in connection with the general subject of inland canals. In a third group of papers on tidal rivers and ship-canals, are described formulæ of the characteristics of a tidal river, modes of estimating the cube of tidal volumes, means of consolidation of ship-canal banks, and dredging. Finally, questions in regard to seaports, warehouses, free ports, and single-lock gates, maritime tolls and the unification of the gauging system of inland boats are considered. One hundred and fifteen folded plates accompany this volume.

—*Harper's*, like *Scribner's*, is a "Fiction Number"—to some an invitation, to others a warning. George Bird Grinnell, in "The Punishment of the Stingy" (illustrated by E. W. Deming), begins a series of Indian legends. Mrs. Humphry Ward, in "Eleanor" (illustrated by Albert E. Sterner), keeps alive the tradition of the English novel. In "English and American Elections" (illustrated by Clifford Carleton) Sydney Brooks goes over ground often covered before, but adds something of his own. He points out that the English Parliamentary candidate stands in an altogether different position from the American Congressional candidate, because he comes frankly before the whole constituency, and asks for their suffrages, while his American congener is put forward and "run" by a party machine, such as barely yet exists in England. The latter, if a Republican, appears only before audiences presumably Republican, if a Democrat before audiences presumably Democratic; the former solicits the votes of friends and enemies, appearing before audiences of a heterogeneous character. Hence the audiences of one are almost invariably sympathetic, and critics and persons who come to interrupt are immediately turned out by the police, while in England an important part of a canvass is the interruption, questioning, and "heckling" of a candidate by members of his audience. But this is connected also, in Mr. Brooks's opinion, with class distinctions. "A certain class feeling is often at the bottom of such heckling and interruptions as occur." This is the one opportunity of the voter to reverse the ordinary relation between himself and the candidate. To the latter, every other day in the year, he doffs his cap. On this occasion, it is he who is the master; his superior is a suppliant for his favor. It is not in human nature not to make the most of the occasion. Besides, this "heckling" illustrates what Englishmen call the national "doggedness," though "others might find a different word." "Americans are said to be an unreverential people, but they dearly worship a majority. In a company of six people you have only to show an American that five are against him to convince him that he is wrong." This is just when an Englishman "becomes finally certain he is the only sane person in the room." The "heckler" gets part of his satisfaction from generally being in the minority. Mr. Brooks instances a candidate, now a member of Lord Salisbury's Government, who was unfortunate enough to mention the year 1792. A member of the audience at once insisted on knowing who was king or queen at that time. The speaker, obviously uncertain as to whether it was George III. or George IV., refused to answer. The inquirer insisted upon his right to be answered, and announced his intention to "stand there" till it was "time to vote." The meeting was for five minutes in an uproar, and in this case the police had to be called in. The remarks of Mr. Brooks, who has lived in the United States for three years, on some of our peculiar electioneering devices are well worth reading.

—In the *Geographical Journal* for July the British Resident of Baram, Sarawak, Mr. Charles Hose, describes a journey into a hitherto unexplored part of his district for the purpose of bringing peace to communities whose normal condition was one of mutual hostility. Graphic are his accounts of the scenery of "the heart of Borneo," the mode of travelling, the customs of a race in its natural state, not yet vulgarized by contact with western civilization, and especially of the ceremonies at the conclusion of peace between two powerful tribes. At the feast which followed this there were "some very good speeches made, their former troubles and differences being explained and discussed in the most open manner. Each chief spoke in turn, and concluded by offering a drink to another, and singing a few lines of eulogy—the whole assembly joining in a very impressive chorus at the end of each line, and ending up with a tremendous roar as the bamboo cup was emptied." The next day the Madangs paid their first tribute, two dollars' worth of rubber per family, which was counted as follows: "Some one mentions the names of the heads of the families in each house, and, as he does so, a man tells each name off on his toes; when five have been counted, another man catches hold of the counted foot, and so on until his feet and hands have all been told off, when another man is used, and this continues until all the names are mentioned, when they halt to see how many men have been used, and where the last one ended. The people whose business it is to hold the feet and hands, cling on to them in the most determined manner until the total number has been checked; and as all concerned take the matter most seriously, it is rather a comical sight when they have to count forty or fifty." The great value of the paper, however, and of the debate which followed its reading before the Society, lies in its testimony to the success of Sir James Brooke's system of government for Sarawak, founded on the principle of aiming "at the development of native countries through native agency." It did not take the various races long to discover "that the main object of the State's solicitude was, not the commercial exploitation of the country or the amassing of colossal revenues, but the preservation and well-being of the people themselves."

—Professor Haddon of the Cambridge Anthropological expedition, who visited Borneo last year, says that Mr. Hose with an assistant, the only white men in Baram, and a police force of twenty or thirty Dayak fortmen, govern a district 10,000 square miles in extent. The only things which are put down are murder and head-hunting and theft. When any of the interior tribes do a little head-hunting, he immediately starts for the place, and "when he reaches the people he simply talks to them. They usually give themselves up or pay their fines—$400 to $500 for a life taken." So great is his influence that "the people who in the past were inclined to give the greatest trouble, are at the present day the stanchest upholders of the Government," and tribes in the neighboring kingdom of Brunei and in Dutch Borneo, seeing how the people of Baram can live in peace and safety, are asking to be put under the administration of Mr. Hose. Another method by which he reaches his people is by having promising young men stay with him in his house for weeks at a time, and in this way they learn what a white man is like. "Thus Mr. Hose's residence is a sort of university, whither the pupils come from all parts of his district to learn a little as to the meaning of government." Dr. B. Sharpe of the British Museum bore testimony to Mr. Hose's efforts to advance science, shown also by the admirable map which accompanies the paper. Not only "he has crowded into our museum enormous series of mammals, birds, insects, shells, and every kind of animal, . . . but there is not a leading museum in the whole world that has not received collections from this indefatigable young man." It may be added that the value of the total trade of the country has increased from four millions to a little over nine millions of dollars since 1888, while the revenue in 1898 was $638,188, with a surplus over expenditures of $94,682.

—The international anti-slavery congress held this week in Paris is the occasion of an article in the *Revue des Deux Mondes* for July 1, by M. G. Bonet-Maury, on the part which France has taken in the anti-slavery "crusade" of the past century. He justly claims for her the honor of having been the first to hear and answer the cry of the slave for freedom by the decree of the Convention in 1794 (revoked under Bonaparte) abolishing slavery in the colonies, and giving to all residents, without distinction of color, the rights of citizenship. But he is singularly forgetful of Wilberforce when, referring to a speech of Duke Victor de Broglie in 1822, he asserts that he "was the first who, in a European Parliament, raised his voice in behalf of the slaves." Wilberforce's first speech for the abolition of the slave trade was contemporaneous with the outbreak of the French Revolution. During the monarchy there were many more or less successful efforts made to put an end to the slave trade, to ameliorate the condition of the blacks, and to prepare the way for their emancipation, which was finally decreed by the republican Government of 1848 under the initiative of Victor Schœlcher. From that time the anti-slavery movement in Europe has been promoted chiefly by the various international conferences, both social and political, from that of Paris in 1867, presided over by É. de Laboulaye, and at which Mr. Garrison was the American representative, down to that of Paris in 1890, when Cardinal Lavigerie was the principal speaker. More important, however, than M. Bonet-Mauray's historical review is his frank exposition of the forms in which slavery now exists in the French colonies. It is everywhere to be found as a domestic institution, though the traffic in slaves is nearly extinct. In the French Congo it still lingers in a most revolting and atrocious form, according to allegations made before the Chamber of Deputies by the Abbé Lemire last December, and not yet denied. The system of contract labor prevailing in Réunion and New Caledonia, it is also asserted, is indistinguishable from slavery. M. Bonet-Maury closes with a sketch of the remedial measures now in force, of which the principal is the "village de liberté" established in all parts of western Africa. These are not merely "cities of refuge" for fugitive slaves, but settlements of freed negroes, who are being taught the "dignity of labor and the sanctity of the family," along with general morality and the Christian religion. Interference with domestic slavery is deprecated by this writer, who would have all efforts directed to elevating through education the condition of the slaves so as to fit them for freedom, while a rigid system of government inspection of contract laborers, similar to that adopted by Great Britain, is strongly urged for the islands. Who shall decide when the slaves are fit for freedom is not indicated.

—A rather singular state of affairs in reference to the conditions prevailing at the German universities regarding admission to the examinations for the degree of Doctor of Philosophy is revealed by the *Zeitschrift für Philosophie und Pädagogik*. In all of the twenty-one universities of the Empire, the gymnasium graduates are permitted to take examinations in all the departments of the philosophical faculty, while there is no agreement, not even in the universities of the same country, with reference to the promotion of the graduates of the Realgymnasia or the Oberrealschulen; the Real or *purely scientific non-classical* graduates being *nowhere allowed to become candidates for degrees. Those who have completed the* semi-classical Realgymnasia are admitted to examinations in twelve universities (of these six are in Prussia), in all departments of the philosophical faculty, while eight admit them in modern languages, mathematics, and natural sciences; and one, the University of Erlangen, only in mathematics and natural sciences. The Oberreal-school graduates (in those institutions the scientific studies strongly predominate) are admitted to the philosophical doctorate in all sections only by Greifswald, in five universities only in natural sciences and mathematics; and in ten (among these six are in Prussia) they are not admitted to a degree at all. Two universities have not yet taken final action in the matter. In view of this, the action of the German Realschul Association, representing the interests of the higher non-classical education in Germany, at the recent convention in Berlin is of interest. At this meeting, attended by more than three hundred philologians, a petition, originally drafted by the National German Society of Engineers, and signed by 12,000 names, was adopted, asking that the graduates of all the nine-class secondary schools, *i. e.*, the Gymnasia, the Realgymnasia, and the Oberrealschulen, should alike and without discrimination be admitted to university privileges and degrees, and that in future the lowest three classes in all the schools of this kind should have the same non-Latin courses. This petition has been presented to the Cultus-Minister of Prussia.

—Fortunate is the scholar who can say, as Professor Aulard does in the preface to his 'Histoire Politique de la Révolution Française' (Paris: Armand Colin & Cie.): "I do not think I have omitted a single important source, or made one assertion not directly drawn from the sources." Professor Aulard has long been an indefatigable editor of the documents of the period. His most noteworthy work of this sort—"Le Recueil des Actes du Comité de Salut Public"—is just reaching completion in about a dozen stout octavo volumes. He is also, with the possible exception of M. Sorel, the most authoritative writer on the political phases of the Revolution. This new work, which is appearing in monthly fascicules, may be regarded as a comprehensive statement of the results of his studies for the last twenty years. Its subtitle, "Origines et Développement de la Démocratie et de la République (1789-1804)," indicates more clearly its scope. In the first fascicule Professor Aulard attacks the tradition that there were, in 1789, men who were consciously republicans, although he shows the strong drift towards republican institutions under the guise of a monarchy. He also brings out clearly the scheme of the bourgeoisie, alarmed by the events of the first summer of revolution, to fortify their own power by constructing constitutional defences against the prolétariat as well as against the monarch. Possibly he overemphasizes this aspect of the Constitution because of his prejudice in favor of what he calls "la République démocratique et sociale." Indeed, this predilection leads him to insist that the men of 1789 were inconsistent because from the first article in the Declaration of Rights they did not conclude that it was necessary to abolish the right of inheritance, as an obstacle to equality, handicapping the sons of the poor in their race with the sons of the rich. Such an interpretation of the Declaration is contrary to the principles of that historical science of which Professor Aulard is so distinguished an expounder. But this is a single defect in an otherwise enlightening study of the political beginnings of the Revolution.

MRS. MEYNELL'S RUSKIN.

John Ruskin. By Mrs. Meynell. Dodd, Mead & Co. 1900.

This book is one of a projected series on "Modern English Writers." How far its plan is that laid out for the whole series, or how far it is the method of the particular author, we cannot yet be sure, but it is a disappointing plan. There are many things that the book does not give us, some of which, at least, might have been expected, and all of which would have been welcome. It does not give us even the outline of a biography; it does not give us any systematic exposition of Ruskin's teaching; it does not give us any analysis of his character, either as man or critic; it does not give any broad or general view of anything. Mrs. Meynell's plan is to take up each of Ruskin's books in the order of publication, to summarize its contents, and give a few quotations of striking passages, and to make a running comment thereon. Occasionally there is a bit of criticism, and sometimes it is shrewd enough, but it is, necessarily, piecemeal criticism, and gets to the root of nothing; it amounts only to an infrequent note of disagreement, which saves the book from mere eulogy. It says, "Here, in the writer's opinion, Ruskin was wrong," but it does not show how his nature, his training, his line of thought betrayed him into error—how he was inevitably wrong.

On the whole, Mrs. Meynell is a Ruskinian and inclined to accept Ruskin's wildest opinions with reverence, if not with entire agreement, and this especially in his incursions into science and political economy. His art criticism even she sees to be limited, one-sided, even, at times, contradictory or entirely erroneous. In general, she defends him from the charge of self-contradiction, trying to reconcile his opposite statements, and boldly protesting that she sees no inconsistency; but sometimes she gives it up. She notes his abuse of Constable and his entire oblivion of the Barbizon school, saying:

> "The reader has to resign himself to the banishment from Ruskin's thought of all the great French landscape. Once or twice he names French modern work with horror as something deathly; but what he knows, if anything, of the young Corot, for example, or of Millet, one cannot so much as conjecture."

Here the one word "young" seems to be a sort of excuse, and to intimate that this school was so new that Ruskin could not be expected to have observed it. Yet she is writing of the fifth volume of 'Modern Painters,' published in 1860, when Corot was sixty-four years old! Indeed, Corot was twenty-three years older than Ruskin himself, and the great revolution in French landscape painting, which has so profoundly influenced all modern art, began ten years before the first volume of 'Modern Painters' was written. Mrs. Meynell defends Ruskin from what she calls the "slander" that he "would have his disciples to 'select nothing and to neglect nothing,' " pointing out that this is meant for advice to beginners only, and that "he allows a great imaginative landscape painter to do what he likes." She does not see that this is one of his contradictions which may be explained rather than reconciled. His *teaching* was purely naturalistic, but his admiration for Turner forced him into making exceptions. It is plain enough that his "great imaginative landscape painter" was Turner, and Turner alone; and his real attitude was that Turner could do as he liked, but that if you did so you would be damned.

Mrs. Meynell's nearest approach to profound criticism is in her suggestion that Ruskin was "no musician," and consequently could not conceive "an art that imitates nothing"; but she does not push the thought home. Whether or not it was from lack of ear that Ruskin so blundered, there is no doubt that to him art was always a statement and "true" or "false"; never an arrangement and beautiful or ugly. This was his fundamental error, and the cause of his struggles and contradictions and entanglements. It was this error that made the final volumes of 'Modern Painters,' which were meant to deal with beauty, only more detailed statements of the same natural facts that had been dwelt on in the first volume. It was this error that led him to justify a Lombard ornament as a representation of the crystals of salt. It was this error that led, finally, to the impossible arguments of 'The Two Paths,' which "a fugitive writer" is rebuked for calling "unutterable bosh," and at which we are bidden not to laugh, though they be nonsense, because it was "an intellectual martyrdom" to have written them.

It would be presumptuous to try, in the tail of a book notice, to write the book that neither Mrs. Meynell nor any one else has written; yet we cannot forbear the attempt to note the heads of it. In the first place, he who would explain Ruskin will have to face the necessity of dealing with a delicate matter in his life; we mean what most of the obituary notices have called his "divorce." Mrs. Meynell is more accurate, and says that his marriage was "legally annulled," while the younger Millais, in a note to his biography of his father, states, without mentioning the name of the husband, that his mother's first marriage was annulled (we quote from memory) "for reasons recognized alike by State and Church." In other words, the marriage was pronounced void after several years because it had never been anything but nominal. This fact has to be mentioned because it throws a flood of light on Ruskin's exaggerated horror of sensuality or of anything even distantly approaching it; and this horror accounts for much of his hatred of the Renaissance, for his love of ascetic and monkish art, for his lack of sympathy with the art of ancient Greece, and for much else. Neither in his faults nor his virtues, his strength nor his weakness, was Ruskin distinctively masculine. He could be lavishly generous, but he could not be calmly just; he could be extreme in enthusiasm, as in denunciation, but he could not be reasonable. He was whimsical, petulant, paradoxical. He had a pretty gift of seemingly logical argument to justify opinions adopted at the behest of emotion. He was positive, dogmatic, subtle, with a conviction that what he liked was right, and that what displeased him was morally wrong, and that the salvation of the world depended upon its recognition of the truth of his preaching. *In all these things* he was less man than woman, and less woman than priest.

In the second place, we must remember that Ruskin was a Scotchman by extraction and a graduate of Oxford—that is, that he came of the least artistic and most religious race in Europe, and that his training was almost wholly literary. He had a strong love for nature, and very little real sympathy with art, and his culture was almost as anti-plastic as that of our own Concord school. If there was merit in a work of art, it must seem to him that it was merit of thought, or at least merit of true statement. Turner aroused emotion in him, and he therefore set to work to prove that Turner was true to nature. Claude left him cold, and he therefore saw plainly that Claude was untrue. He formulated a theory of art which could, and did, lead only to Pre-Raphaelitism; and when he found that Turner could by no means be fitted into his theory, he "hedged" and made exceptions.

It was the insularity of the Scotch-Englishman that made Ruskin blind to the existence of any art out of England that was not three hundred years old, and one wonders if it were not because Constable was admired in France that Ruskin could see no merit in his sturdily British style. But of course Constable was even harder to fit into the pre-Raphaelite theory than Turner; he was in some sort a rival of Turner's, and he had not begun by rousing Ruskin's emotions. As Millais said, Ruskin's eye was "only fit to judge of portraits of insects." He saw everything in detail, and a synthetic manner of painting could only offend him. If he had ever said anything of Corot, it would likely have been that he was slovenly and smeared. He had also a love for colors and no eye for color, and gray painting reminded him only of corruption. He varied greatly in his feeling at different times, but what ultimately most pleased him was brightness of colors, with little light and shade, accuracy of drawing, minute finish, and religious emotion or literary thought. The painting of painters pleased him only exceptionally, and when it did he generally gave a wrong reason for it.

In these two elements of Ruskin's nature, his irrational emotionalism and his narrowness of culture, lie the explanation of much besides his opinions on painting. His race and training had made of him the bigoted evangelical who could inveigh against England for having "impiously conceded to the Romanist" a place in Parliament, while his emotionalism made him the lover of the "ages of faith" who wanted, as Charles Reade said, "to make John Bull back again into John Calf." He hated smoke and grime, and always had money enough to enable him to travel in his own carriage like a good old English gentleman; so he cried out against the railway which was first making it possible for poorer men to see the things, whether in nature or art, that he most loved. He wrote many books, yet he probably had his doubts about the utility of the invention of printing.

In words he was an artist, and, like most artists, paid little attention to theories when they interfered with practice. He preached that truth, and truth alone, was the aim of art, but he never spoiled a description by too nice a regard for facts. His style in writing is not unlike that of his hero in painting—effective, but something perfervid and overstrained, lacking in restraint and moderation. No one's patches are more purple than his, and at his worst they are confluent and the whole texture is incarnadined. Yet it is for his style that his books will probably long continue to be read, or rather to be read in, after their influence, never really very great, shall be entirely a thing of the past. The intensity of his feeling often made him clear-sighted, and his writings are full of true as well as of eloquent things, but they must be hunted for and sifted out. As for reconciling them with each other or with the general body of his doctrine, he seldom tried it himself, and it is hardly worth while for any one else to do so. Half Socialist, whole absolutist, artist, poet, preacher, he is everything but a critic or a philosopher.

Brown of Lost River. By Mary E. Stickney. D. Appleton & Co.

Eben Holden. By Irving Bacheller. Boston: Lothrop Publishing Co.

Pine Knot. By William E. Barton. D. Appleton & Co.

The Jay-Hawkers. By Adela E. Orpen. D. Appleton & Co.

'Brown of Lost River' is so *al fresco* a story of a Wyoming ranch that a move to Denver at the last is almost suffocating. There is a thoroughly delightful atmosphere of prairie and hill; of wild-rose thickets and water-courses; of bronco-breaking and cattle-herding; with darkly contrasting mud-holes and happily antidoted rattlesnakes. The social phases of Wyoming, too, whether in dinner-parties or cowboy dances, are touched into the scene with lively colors. There is a cowboy hero who is just too sweet for anything and just strong enough for everything; there is a complicating unseen lover, a heroine with a small, gloved hand and loose strands of hair, which the light wind plays with, touching the girl's cheek like a caress. One seems to have met such an one before, but he will at least find originality in her not knowing what to do when the rattlesnake bites the hero. The heroine who spends herself in doing the useless thing is on the whole refreshing. It must be owned that the love story needs a considerable amount of coddling and coaxing to last through the book. Nor is the characterization marked by exceptional cleverness. Thin rather than dull, however, the book is sprightly and agreeable; the persons are the accessories; the real flavor and zest of the story lies in the pictures of ranch life, and the writer's ability is best displayed in whisking us along with her to scour the plain.

After a Wyoming story it is suggestive to find in the opening scene of 'Eben Holden' that the "West" to which he is emigrating with a small boy carried on his back in a big basket, is the Adirondack wilderness of two generations ago, to which he is fleeing from a ruined home in Vermont. Like 'Brown of Lost River,' the story is another tincture of America; if the one is geography, the other is agriculture. The forest-camp and the farm were nearly allied in the rugged early days of the "North Country" settlers. Even New York, for an episode, with Horace Greeley in high relief, suggests agriculture and serves to maintain a homestead flavor. Uncle Eben is a rural character whose oddities, kindnesses, and shrewdness no village should be without. He loves children, goodness, and horses; he hates meddling, cruelty, and the cheating horse-dealer. "Never knew a mean man t' own a good hoss," he says. The autobiographer, the little boy in the basket, tells the story of his life, which ranges and changes from the farm to the *Tribune* office and to the battlefield of Bull Run. Few latter-day American stories omit a glimpse of either Horace Greeley or Lincoln, and this one introduces both. Indeed, the author declares of Lincoln, "he reminded me in and out of Horace Greeley. . . . They had a like habit of forgetting themselves and of saying neither more nor less than they meant. They both had the strength of an ox and as little vanity." The story is discursive, abounding in maple-sugar and Yankee dialect, in trout, deer, and panther, and all wholesome wood-lore, in rustic poetry and philosophy, in journalistic and military anecdote—a mild, kind book.

In 'Pine Knot,' too, the story serves, but the *raison d'être* of the book may be found in its contribution to the history of the mountain regions of Kentucky during the days of anti-slavery agitation, with their culmination in the civil war. The path whereon the story moves is a comparatively untrodden one. The hero, John Howard Buzbee, a Virginian, is an old visionary and enthusiast, a scholar and philanthropist, alienated from his kindred by his anti-slavery views, full of dreams of the abolition of slavery, but holding strong convictions of the righteousness of compensating the slaveholders. Working with Lundy, he is opposed to Garrison in methods, though still an abolitionist. When the discovery of a supposed silver mine in the Kentucky mountains holds out to him the prospect of vast wealth, his all-absorbing object is to purchase the slaves and save the Union peaceably with honor. To-day, when the public eye is turned upon the Kentucky mountaineer, it is interesting to trace the political pedigree, in the sixties and earlier, of a border town between Kentucky and Tennessee. "Time had been, in a Presidential election of general interest when the Pine Knot mind was a unit, that the presence of the State line added its special glory to an election. Every one in Pine Knot, for instance, had voted for Henry Clay, and, . . . each voter having polled a good and honest vote in his own State, stepped over the line and voted in the other." There were no booths. As lately as in '98 in a neighboring county the voting was done in the old way, the people having torn down the booths "established by the new and cumbersome Australian system." Said a local politician, "When a man gits in thar with his lead pencil, who knows whether he votes the way he says he will?" In 1860 they managed it thus:

> "'How be you-alls in Kaintuck votin'?' asked Sim.
>
> "'Dinged if I know. I sorter had a *idy* of votin' for Douglas.'
>
> "'Did ye? That's too bad. I sorter layed off to vote for Bell 'n' Everett. What's the difference?'
>
> "'Dinged if I know,' replied Dan again. Finally, Sim echoing Dan's avowal that he ain't no rebel nor no black abolitionist, they agree to go over and take somethin' and then split the difference and vote for Lincoln. 'He's a mountain boy and some kin of ourn, I reckon.'"

The private disillusionment of Buzbee and the conversion of the State from neutrality to loyalty are worked out into a story full of interest, if something lacking in compactness. As a piece of local history 'Pine Knot' takes more than creditable place in the fast-swelling library of books about ourselves.

Another, equally of the sixties and equally a document in political history, is the powerful and painful record of 'The Jay-Hawkers,' a name given the Free-Soil raiders who used to swoop out of Kansas into Missouri, and carry off parties of slaves into freedom—raids returned with interest by the Missourian Bushwhackers, burning, plundering, and recapturing—Border Ruffians all. Of the four books under notice this has the most firmly knit story, and is the bloodiest and most hideous in its theme. It carries entire conviction of the writer's familiarity with the horrid scenes she describes, so minute is the tale, the telling so thrilling from its very dispassionateness. Reading such a chronicle, we are properly attuned to our present daily morning news from South and West and Orient.

Paris. By Hilaire Belloc. London: Edward Arnold. 12mo, pp. xii, 476. 7 maps.

From the dissyllabic title of Hilaire Belloc's latest book, but a vague idea of its contents is to be gained. Is it a guide, a mass of statistics, or a book of literary gossip? It is certainly none of these, but, as one who knows its author's training and inclinations might expect, it is a serious historical essay. It deals with the growth and changes of the city from pre-Roman times to the end of the eighteenth century. Its aim is to show the city's varying but united life, to give a picture of that ever-shifting crowd, whose hopes and fears, whose strength and weakness, made Paris what it was from time to time, and the outcome of whose united lives has made it what it is to-day. The author seeks not alone to show the physical activities that have resulted in the thing we know so well, not alone to tell us of the rearing of the Roman palace and amphitheatre, of the mediæval walls, and the cathedral, but to make us realize the great enthusiasms and vagaries of the people—enthusiasms that resulted in Notre Dame and in the University; vagaries that led to the depths of the great Terror. Hence we have a history not of the people, nor of their rulers, nor of their monuments, nor of their intellectual life, but rather of all these things combined, so that one lays it down with a sense of the continuity of the city's life, with a feeling curiously different from that with which one stands on a high place and views a great stretch of country; with a feeling, rather, of having looked upon a little spot down in a valley and watched its growth, its shrinkage, and its regrowth for a space of full two thousand years.

Though it runs to almost five hundred pages, Essay is, perhaps, the best word to describe this volume. Formal history it certainly is not, and the author is the first to disclaim any intention of making it such, for he says at the outset that the things he has put down are such gleanings as a man gets from old prints and chance phrases of memoirs, with an outcome as superficial and as personal as a traveller's drawing or as a man's diary, yet serving to give just the necessary framework upon which the memory and imagination may build. Somewhat too modest an estimate is this, for though the facts may come from scattered sources, they are so arranged and connected as to leave a lasting impression on the mind, especially as to the peculiar character of each of the epochs into which the author divides the long space of time he has to cover. We feel the Roman influence powerful for good, civilizing, organizing, developing the little Gaulish village into a provincial capital, giving it laws, and bringing order and prosperity out of chaos and want. Some clear idea of what this Gallo-Roman Lutetia was, with its towered wall encircling the Island, with its temples, its palaces, and its amphitheatre, we may gain, but we are soon swept on to the time of that mysterious Geneviève about whom we know so little with certainty, but who, from her twentieth to her eightieth year, was such a potent factor in the city's life, and after whose death the people dwelt for five centuries in the shadow of the dark ages. From all those years of confusion we gain another clear impression, namely, of the way Paris crumbled bit by bit, and of the way the light, the artifice, the well-ordered monotony of the Empire were lost, and how there grew up legend, miracle, and the ordeal of fire.

Then a sudden change. The doubt and despair at the coming of the year 1000 disappear. Not Paris alone, but the whole of Europe awakes. Great kingships, consolidating scattered States, appear. The Roman law is revived, universities and a vernacular literature mark the coming of the early Middle Ages, but, most of all, the Gothic architecture stands as the memorial of the splendid energy and enthusiasm that pervaded all society. For Paris it was the time of the walling of the city, of the founding of the Louvre, of the building of Notre Dame. With those later Middle Ages, the two centuries reaching from St. Louis to Charles VIII., come thoughts of war, pestilence, and famine. Paris suffered and changed in a way that was typical of the time. As society grew in luxury and misery, Paris expressed the change by huddling its people together more closely than ever before, and by building that splendid Palace of St. Paul of which scarcely a vestige is now left. It was a time of despair for the common folk, a time when the King's orchard yielded its unfailing crop, and when the Danse Macabre was no mere piece of empty irony.

How profoundly the state of society was influenced by that clear light coming over the Alps from Italy, by the new ideas brought back by the troops of Charles VIII., we all know, but we fail to recognize that the changes wrought upon the city by the Renaissance, including as they did the Louvre, the Hôtel de Ville, and the Tuileries, failed to transform it as a whole. The effect of the new movement was but partial and accidental. The aspect of Paris at the close of the sixteenth century was still mediæval, and it was left to the seventeenth to rebuild the city and to blot out the traces of the Middle Ages, as it was left to the nineteenth to again rebuild the city and to blot out the traces of the seventeenth.

In what has been said we have, perhaps, failed to bring out the fact that a vast amount of detail goes to make up this general impression; that the book not only characterizes vividly the several periods of the city's life, but brings before us all the great men who passed across its stage from Cæsar to Robespierre, all the great movements that caused its transformations, all the great buildings that once were in it or that still remain.

Some Reminiscences of a Long Life. With a few Articles on Moral and Social Subjects of Present Interest. By John Hooker. Hartford: Belknap & Warfield. 1899.

Mr. Hooker's reminiscences make their principal appeal to his personal friends, and especially to his surviving associates of the Connecticut bar, of whose departed elders he writes with generous and affectionate appreciation. Mr. Hooker was born in Farmington, Connecticut, in 1816. He is a direct descendant of Thomas Hooker, the first minister of Hartford, with five intervening generations. But his maternal grandfather, Daggett, who lived till 1830, was born in 1740, and might easily have known old people who knew the first settlers. Hon. William M. Evarts and Senator Hoar are Mr. Hooker's second cousins. His marriage brought him into another interesting circle, his wife being Isabella, the youngest daughter of Dr. Lyman Beecher.

For the general reader no part of Mr. Hooker's book is more interesting than his introduction, which is supplemented, further on, by an account of his early life in Farmington, and the events and habits of those years. We have a beautiful picture of the half-century and longer ministry of Dr. Porter (father of President Noah Porter), who was born and died in Farmington, and was never settled anywhere else. It was his custom to preach one doctrinal sermon every Sunday—one of three, the evening one less formal than the others. Knowing every one from his birth up, no funeral baffled him; given the saddest reprobate, he could revert to his days of innocency. He never could have been guilty of crediting a text from *Romans* to the *Psalms*, as Mr. Hooker causes him to do on page 15. At one time an attempt was made to persuade Mr. Hooker to give up the law and settle as a minister in Farmington. He flatters himself that he might have had as long a ministry as Dr. Porter, but he would certainly have been tried for heresy if he had improved his Calvinism at the rate indicated by his theological confessions in one of the later sections of the book. Writing of everlasting punishment he says, "This dogma I reject with all the force that I can put into the rejection." Concerning the atonement he is not more orthodox, while his Christology is uncertain, and his view of the Scriptures that of the modern critic.

He is a "judicious Hooker" in his choice of stories drawn from his own experience and other sources. That is a good one of the boy's translation of Sallust, where it was written that one of Catiline's conspirators was *sui generis*—"a kind of hog." Lovers of animal stories will delight in that of the ox which by his own wit made his way back from New York State to Farmington, swimming the Hudson on the way and arriving on Thanksgiving Day. All of his companions had been killed in an Indian ambush. When a young man, Mr. Hooker invited a very respectable colored man to sit in his pew one Sunday morning; whereupon one of the church members said he had done more to break up the church than anything else in its whole history. There are several good fugitive-slave stories, one of them about a colored preacher in Hartford of whom, in the course of events, Mr. Hooker became the legal owner for a few days. It was a novel sensation to own a Doctor of Divinity—Mr. Pennington got his degree in Germany, whither he had gone for safety—and, when Mr. Hooker gave him his liberty, he kept the degree, he tells us, for his own glory.

Hooker was Evarts's classmate. Much given to pleasantry, he must have been an agreeable companion to his legal associates and friends. He writes of the former with much good humor. His dial seems to have marked only the sunny hours. One of his few regrets is that he did not get a judgeship in the Supreme Court of Connecticut in 1864, which would have meant a chief justiceship in a few years. But the manner of his losing the office was as creditable as his discharge of it could have been.

Of the papers on various subjects included with the Reminiscences, the most interesting are those on Anarchy, Woman Suffrage, and Spiritualism. There is a valuable appendix—Mr. Julius Gay's "Social Life in Farmington Early in the Century"; and Mr. Hooker's "Early Abolition Movement" adds some particulars of interest in that connection.

Discussions in Economics and Statistics. By Francis A. Walker. 2 volumes. Henry Holt & Co. 1899.

The publication of these papers will add nothing to Gen. Walker's reputation as an economist. He made some contributions to the science of political economy which were certainly suggestive, and, in the estimation of many, of permanent value. Such were his contention that wages are paid out of product, and his application of the principle of rent in determining the recompense of the captains of industry. These views, however, occupy a very subordinate place in the discussions that are here reprinted. Nevertheless, we think that Professor Dewey has done well to collect and arrange this material. It constitutes in a way a chapter in the economic history of the country, to say nothing of its instructiveness as exhibiting the development of the author's views.

Gen. Walker possessed a very alert and active mind, and he was, during all his life, in incessant contact with men and with affairs. He felt strongly, and spoke and wrote vigorously. He seems never to have hesitated to express his opinions with great positiveness; frequently, with great audacity. While these opinions were in many cases so ill-considered as to be of little value, and were indeed occasionally contradictory and even fallacious, they were yet advanced with so much vigor (and it is fair to say, with so much authority) as to give them influence. Yet the danger of trusting to personal authority in matters of science has seldom been more clearly illustrated than in his case. The most remarkable illustration of the unfortunate consequences of such surrender of private judgment took place in the agitation for bimetallism. Gen. Walker's views are too well known to be recapitulated, but it may be forgotten that he practically demoralized financial opinion in Boston, and not improbably influenced the action of leading Congressmen from New England. Events have so completely falsified his predictions as almost to make his untimely death seem merciful. It would have been hard for him to keep silent about the present situation of bimetallism, and harder still to say anything about it that would not amount to an abdication of prophetic functions.

The agitation for bimetallism may be regarded as too controversial a subject to be properly introduced here. We may illustrate our point by other instances. Let us take the case of the labor-unions. Political economists of the straiter sect have always looked on these unions with mingled feelings, because their avowed purpose was to attain advantages for certain classes of laborers by means which might prejudice the interests of other and more helpless classes. It can scarcely be contended that events have not justified this apprehension. But Gen. Walker was positive that the trade-unions would not yield to Socialistic tendencies. Trade-unions, he said, were all over Europe hostile to Socialist agitation. "I think," he observed, "we may count with certainty upon this attitude of the trades unions toward Socialism being maintained." He pointed out at the same time (1887) that Socialism was declining in France, and explained why it must continue to do so. Were any one to make such assertions as these at the present day, he would be regarded as, to say the least, a very ill-informed person. He would be told that he was evidently entirely unacquainted with current events in France, and reminded that the English trade-unions had declared in favor of "nationalizing" land, capital, and the means of exchange, and that they objected to the plan for universal old-age pensions only because it was limited to those who were too old, and because its provisions against fraud were too stringent.

We shall refer, not without melancholy, to one more illustration of the superficiality of view and the rashness of judgment that impaired the work of this vigorous and talented man. In his oration at Brown University, in 1889, he maintained the thesis that "quantity has with us determined quality"; that our marvellous growth in numbers, in territorial extent, and in industrial power, has caused us to develop to a remarkable degree "the spirit of civility, reciprocity, and fair play in the relations of this with other nations, as compared with the earlier days of the republic." During the first half of this century we behaved ill toward nations of high rank, "while our course toward our weaker neighbors was not altogether exempt from the blame of wanton aggression." After referring to our dealings with Spain—"always, in spite of much provocation, a good friend of the United States"—and our abundant "tall talk" about "manifest destiny," he continued:

> "How great the difference to-day! Let one ask himself when and where he last heard any of that vapid, confident talk about 'manifest destiny,' once so common in the press and in the halls of Congress; let one ask himself what, in the America of our time, corresponds to the filibustering, the bluster, the threats against weaker peoples of thirty or forty years ago, and he will obtain a perhaps unexpected view of the mighty change that has passed over our temper as a nation. In the last few years I have read the columns of a hundred newspapers without meeting a paragraph that breathed the old-time spirit; I have travelled many thousands of miles without hearing from the lips of any private citizen a word which testified to a disposition to wrong even the weakest of our neighbors. A bit of buncombe now and then in Con-

[illegible]

South Africa Past and Present. By Violet R. Markham. London: Smith, Elder & Co.; New York: Scribners. 1900.

A History of South Africa. By W. Basil Worsfold. London: J. M. Dent & Co.; New York: Macmillan Co. 1900.

Books on South Africa are, [illegible] of great interest. The first of the books named above is a handsome well illustrated volume divided into three parts: I. Sketch of South African History (1652-1899); [illegible] Affairs; and Notes from a Travelling Diary. The historical essay is written with evident conscientiousness, but the continual pointing a present moral by a past happening is too constantly in the author's mind to permit of real historical treatment. This is the same old story told with a little more vivacity and a little more conviction than usual; nothing more. The essays on the less controverted native question are more dispassionate, as Miss Markham's own observations here, instead of impeding, assist her. Others have gone into the matter more at length, but her readable chapters on this point are worth while. The Kaffir keeps cropping up again throughout her personal reminiscences and notes of travel, which are the most valuable part of the book after all, being the lively and positive impressions of a good natured and sensible observer. She speaks well of her various hosts, a good thing in a traveller. Some forget to do so, but where she has eaten salt she does not stint praise. She would even have us believe that Mr. Cecil Rhodes is a simple genial person, fond of flowers and of seeing the public enjoying his gardens.

Mr. Worsfold's little book may be slipped into the pocket, yet in its compact contents is the best brief statement of the British side of the present case we have seen. This author does not find that the franchise or the Kaffir question, the academic discussion over "suzerainty," or all three of them caused the war. He demonstrates very plausibly a natural ethnological evolution of two races, with collision at the end as inevitable as when two trains converge from parallel tracks on to a single line. The only difference lies in the hope of ultimate reconciliation and fusion that survives a collision of races. The process is a slow one, but history shows that no feud is eternal, and that no conquered race ever failed to modify or be itself modified [illegible]

Political Growth in the Nineteenth Century. By Edmund Hamilton Sears, A.M. Macmillan. 1900. Pp. vi + 616.

Mr. Sears has produced a useful book, although its usefulness might have been much increased if he had adopted throughout the method of the historical manual, instead of digressing occasionally into that of the literary résumé. Such a work is much needed, for since the translation of Müller's 'Political History of Recent Times' was issued, about 1881, nothing has appeared bringing the chronicle down to date. Seignobos's exhaustive treatise deals with Europe only, and is, moreover, critical rather than narrative in treatment. Mr. Sears falls far short of Müller in compactness, but he practically holds the field alone for the events of the past twenty years.

Some sections of his history are very good: his account, for instance, of United States politics since the civil war, and parts of his French and English history. At other points he is vague. Thus, no reader could get from these pages a vivid idea of parliamentary degeneration in Italy since 1870, of the petering out of the old Liberals, of Depretis and *trasformismo*, of Crispi's purely personal government, of the chaos of political cliques, and of the recent unholy alliance between the Vatican and the Anarchists and Socialists. Yet, to understand contemporary politics in Italy, one must know these determining facts, and one has a right to find them intelligently stated in even an epitome.

A critic does not demand, of course, that an author shall agree with him in opinions; but there are certain facts and personages about whom most historical students are agreed. One is surprised, therefore, that Mr. Sears should continue to paint the atrocious tyranny of J. R. Barrios in Gautemala in the rosy colors which the agents of Barrios himself laid on thick, at the time when he was bent on luring foreign capital into that country. In general, Mr. Sears's account of the Latin peoples seems to be based only on works in English or French—a serious curtailment of his sources of information. Nevertheless, the titles cited in his bibliography of twenty-three pages comprise much excellent material [illegible] and will help all [illegible]

We may point out a few of the errors we have detected, so that by their correction any later edition of the book may be improved. The date of the crowning of William I. at Versailles is given December, 1870, on p. 44, and January 18, 1871, on p. [illegible]. It was Frederick William II., not III., who joined the coalition against France (p. 138). The Holy Roman Empire was abolished in 1806 as stated on p. 128, not in 1804 as stated on p. 140, where also the head of that empire is styled "Emperor of Germany," a title which he never bore. Rudolph of Hapsburg acquired Austria in 1278, not 1273 (p. 138). Mr. W. L. Wilson was a Representative from West Virginia, not from Virginia, when he drew up his famous Tariff Bill (p. 455). The French garrison was not withdrawn from Rome, "partly in compliance with a request of Queen Victoria" (p. [illegible]), but in desperation, when Napoleon III. clutched at anything to save him from the Prussian deluge.

On the whole, there are commendably few errors, and the general impression left by Mr. Sears is that he wishes to tell his story without prejudice. The statistical paragraphs which he has added to many of the chapters help to bring before the reader the present situation in the chief countries. At a time when the world seems about to plunge into war for the sake of trade, such statistics are particularly useful.

BOOKS OF THE WEEK.

The Nation.

NEW YORK, THURSDAY, AUGUST 16, 1900.

The Week.

There was a meeting of Anti-Imperialists at Faneuil Hall on August 8 to give expression to the sentiment prevailing in that quarter for the endorsement of Bryan at the Convention to be held at Indianapolis a week later. The principal speakers at the meeting were ex-Gov. Boutwell and Mr. Gamaliel Bradford. The upshot of it was a notice that the promoters intend to give an active support to Mr. Bryan, whether the Indianapolis Convention endorse his candidacy or not. This is their right, and, while we cannot join with them, we are glad that the spirit of independence in political matters is still alive in the sacred precincts where the voice of Gov. Boutwell was again uplifted for human liberty. It is evident that the endorsement of Bryan by the Convention at Indianapolis would be followed by a division at once. It is more proper to say that it has been preceded by a division, which would become more pronounced in the event that an attempt were made to bring in a verdict for Mr. Bryan, as the settled judgment of the persons, in various parts of the country, who are opposed to the experiment of a republic attempting to govern an empire scattered over distant parts of the globe. That a large number of them will refuse to vote for Mr. Bryan under any circumstances is now well ascertained.

Towne has withdrawn as the Populist candidate for Vice-President. Everybody expected that he would do this, sooner or later, and that the Populist National Committee would then put Stevenson in his place. Towne writes a long letter to explain his course, but the vital part of it is that in which he argues that Stevenson is quite as good a Populist as he is. He is entirely right about this. As he recalls, Stevenson was a Greenbacker in Congress over twenty years ago, and he opposed sound-money principles when he was Vice-President under Cleveland. If he should become President, he could be as thoroughly trusted by the Populists as Bryan. In fact, it would have been hard to pick out for the second place a man, nominally known as a Democrat, who so well represents the principles of Populism as Stevenson. Towne's brief record renders him a weak candidate beside this consistent supporter of unsound financial theories for twenty-five years.

An attempt has been made by the Brooklyn *Eagle* to discover the attitude of German-American voters in this campaign by questioning the editors of representative German-American newspapers. Twenty-four replies were received from editors whose journals are credited with a circulation of 325,000 daily, of whom fourteen think that Bryan will receive the majority of German-American votes, and five that McKinley will be favored by the larger proportion, while the other five are non-committal. As a rule, the smaller papers favor Bryan, the largest and strongest expression on that side coming from an editor in Duluth, Minn., who claims a circulation of only 1,475. The *Staats-Zeitung* of this city says that the majority of American citizens of German birth are equally opposed to Imperialism and to free silver coinage; that, as they are unable to defeat both at the same time, they will probably vote against the issue which they consider the most dangerous at this time; that the so-called German vote is awaiting developments, but that in any case McKinley will not receive so much support as four years ago. Several editors take practically the same view as is expressed by the editor of the Chicago *Abend-Post*, that a German-American newspaper has no better means for ascertaining the opinions of its readers, or of German voters generally, than a paper printed in English, and that German-American voters are divided in their opinions like all other citizens.

Mr. Coler has contributed his share to the much-needed work of directing the minds of the people of New York city and State to their own domestic affairs. There has, perhaps, never been a time when their local interests required their active interest and most diligent attention more than now. The system of boss rule has become so far perfected that it is a serious question whether the citizens who are not in politics for what can be made out of it—or, as Richard Croker has frankly put it, who are not "working for their own pockets all the time"—have any share in the government. It is certain that when they cease to have any share in the government they will cease to have any deciding voice in the control of their own property. The chief function of government is the taxing power. The men who can say how much shall be paid into the public chest, and by what method it shall be expended, are the government for the time being. If the taxpayers once lose control over the taxing power, the recovery of it may be possible only through revolution. The service that Mr. Coler has rendered consists in the practical and concrete way in which he has presented this overmastering issue to the people of the city and State. He has used the Ramapo Company for a text, and a better one could not have been found. But Ramapo is only one of many that might have been employed. Their name is legion and they are growing in number and strength in proportion as they are allowed to control the politics of the State. Gov. Roosevelt put a curb on them. They could not control him, but they managed to get rid of him, and now the question is whether his successor shall be a more manageable man, and whether the taxing power shall reside in one or other of the party machines (possibly in both), or whether the taxpayers themselves shall have the preponderating influence in that behalf.

Mr. Coler's influence reaches beyond the Democratic party. If he is to be nominated for Governor by the Democrats at Saratoga, that fact will compel the Republicans to give us an equally good candidate. Fortunately, the Republican Convention is to be held first. It cannot be known to a certainty beforehand whether Mr. Coler will be nominated or not. Therefore his influence will be exerted upon the other party almost as strongly as though he were nominated. The Platt machine must take into its reckoning the possibility of his nomination, and this possibility will become more and more alarming if Odell, or any tool of the machine, is nominated before the Democrats come together at Saratoga. If Mr. Coler is nominated, the backbone of Ramapo will be broken. This fact ought to have a decisive influence on Brooklyn, where the condition of the water supply depends not upon the amount of water obtainable, but upon the views of Tammany Hall. The politicians who have Greater New York in their grip are trying to compass the ends of the Ramapo concern by multiplying and exaggerating the difficulies of existing water supply, and pointing to this impecunious private company as the sole means of procuring a larger supply. Brooklyn is put to the torture for this purpose, and Brooklyn has it in her power to give the deciding vote for or against Mr. Coler at Saratoga. If she casts in her lot with Tammany and Ramapo, her punishment will come from them, and will be richly deserved. She can, on the other hand, contribute largely to the betterment of State and city politics, as well as of her water system, by giving to Mr. Coler her votes and influence in the Saratoga Convention.

The detailed statement as to the appropriations made by Congress at its last session brings out clearly the extent to which our national expenditures are swollen by outgoes on military and naval account, present and past. The largest single item in this list is that of $145,245,230 for pensions; the army calls for $114,220,095, the Navy Department for $65,140,916, and fortifications for $7,383,628, with $674,306 for the Military Academy. As the grand total is $710,150,862, it will be seen that almost one-half goes to expenses growing out of past and present wars and preparations against wars that may come. In addition to the specific appropriations for such purposes, contracts were authorized which cover two new battle-ships, three armored cruisers, three protected cruisers, and five submarine torpedo-boats, to cost, including armor and armaments, $43,194,094. Comparing the total for the session recently closed with the figures for the last session of the previous Congress, appropriations for the army show an increase of $33,789,891; for the navy, $17,040,947; and for fortifications, $2,473,726.

It is surprising and encouraging to find that the increase in offices and in salaries is not so large as was to have been expected. It is true that new offices were authorized to the number of 5,069, but 2,799 were at the same time abolished, and more than half of the net gain was for additional clerks in post-offices, and assistant postmasters, almost all of whom were undoubtedly needed. The same is true of 97 new places in the Congressional Library, and a pretty good case is made for most of the other 886 offices created, except the twenty-three for Congress, the presumption being that these places are established for political reasons. While 487 salaries were increased, at an annual cost of $135,188, only eight were reduced, to the amount of but $1,658. Nearly two-thirds here goes to 300 supervisors of census, who are appointed for political reasons, and who consequently find it much easier to get $250 extra apiece than more deserving men who have no "pull."

A rise in the stock market in the face of large exports of gold is an unwonted phenomenon, but it is explainable by the fact of dulness in the money market so extreme that an expulsion of a part of our surplus capital is felt as a relief. Further evidence is found in the fact that the entire British loan was oversubscribed in this market, and that the large subscribers were allotted only one-half of their subscriptions, the smaller ones getting about 60 per cent. The truth must be acknowledged that business is not good, and that the boasted prosperity which was to carry the Republicans to an easy victory this year has disappeared. It may reappear in the early autumn—we are inclined to think that it will—but, for the time being, stagnation exists. Manufacturers are running on half time, or closing temporarily, in order to work off surplus products, and perhaps to stave off disputes about wages. Some part of this stagnation is due to the political campaign itself. A Presidential year is always relatively a dull year. Yet this summer is duller than the corresponding period of 1896, although the danger arising from currency madness was greater then than it is now. Probably the inevitable reaction from the tremendous speculations of the early part of 1899 has come somewhat sooner than it was expected, but fortunately it was not ushered in by a money panic. If this be the true explanation, the reaction must work its own cure. Nobody can do anything about it. Things must take their own course.

The outburst of angry criticism, in the conservative London press, against Sir Michael Hicks-Beach's policy in allotting the British Exchequer loan, reminds the reader curiously of the similar attacks on Secretary Carlisle after the American loan of 1895. In both instances, it is plain that national pride was touched by the Government's appeal to foreign capital. In both, the public criticism was sharpened by the fact that the loan was placed beforehand by private arrangement, and was not opened to subscription by the general public. On the Government's side the resemblance is still more marked, in that the policy of placing the loan was in each case governed distinctly, not by simple need of capital, but by the wish to obtain such capital in the form of gold, to restore a depleted reserve. On February 12, 1895, immediately before the issue of the Belmont-Morgan loan, the total cash reserve in the Treasury stood at the sum of $143,000,000, which, though not large for the Government's purposes, was still not alarmingly low. But the gold reserve against legal-tender notes, which should have been kept at $100,000,000, had fallen to $41,340,000. Domestic loans had failed to prevent the constant depletion of the gold fund through note redemption, and the Treasury therefore had recourse to the foreign markets. One-half of the gold paid over, the loan contract stipulated, "shall be obtained in and shipped from Europe." In the week when the British Exchequer closed its recent contract with the New York bankers, the Bank of England's ratio of reserve to liability had fallen nearly to 35 per cent., 40 per cent. being the accepted minimum of security. The Bank of England, as the issuer of Great Britain's currency, is always a cause of legitimate concern to the Government; it needed to replenish its gold reserve; the foreign exchanges were unfavorable, and the placing of another loan in London would not only add nothing to the Bank's reserve, but would pile up another load of liabilities through borrowing by loan subscribers.

So far, the analogy of the loan expedients is rather striking. Sir Michael Hicks-Beach's operation ought to go far to remove from the popular mind the lingering notion that Mr. Carlisle's bond sale of five years ago was a reckless piece of financiering. It is true that the American loan of 1895 went to the bankers below the price commanded on the market by similar outstanding bonds, whereas the British loan went virtually at the market price. But it must be remembered that the Exchequer issue is a gold loan pure and simple, and that the Belmont-Morgan syndicate offered in 1895 full market value for bonds with the same provision, which Congress elected to refuse. Furthermore, we may add that the circumstances warranted Mr. Carlisle's operation far more unquestionably than they have warranted that of Sir Michael Hicks-Beach. Mr. Carlisle, in borrowing gold in 1895, was distinctly fulfilling his official duty, and discharging a legal requirement of his place. Sir Michael Hicks-Beach, as London critics have not been slow to indicate, went somewhat out of his way to help an institution which had not exhausted the means of relieving itself. It was the common opinion in Lombard Street that a further advance in the Bank of England rate, or even less radical expedients, would certainly have drawn gold from New York, and probably from elsewhere. What is, perhaps, most important of all in this comparison, is the fact that in 1895 the convertibility of the United States currency was in imminent peril. At New York, the conversion office for the Government notes was already on the verge of suspending payments. No such crisis had arisen this month in London to force the hand of the Exchequer. The real danger was not suspension of gold payments, but merely such compulsory contraction of Bank of England loans and liabilities as would demoralize financial London.

The Neely case continues to present novel and interesting phases. In its zeal to secure punishment, the Government appears to have instituted three different proceedings, hoping that one would succeed if the others failed. Judge Lacombe took a favorable view of the extradition proceeding, but announced that he would not sign an order until the other proceedings were discontinued. But just as he was about to sign the order, the Government at the same time being ready to discontinue the other suits, Neely's counsel applied to Judge Wallace for a writ of habeas corpus. The application was denied, but an appeal to the Supreme Court of the United States was allowed. The ground of the application was the imprisonment of Neely under the act of June 6, 1900, which was passed for the especial purpose of sending Neely to Cuba for trial; his counsel claiming that the act was unconstitutional. But it seems that Neely was not held under that act. He was arrested in a civil suit for conversion. Probably this was done in order to preclude an application for habeas corpus. Judge Lacombe's idea seems to have been that Neely might be detained in this way until the moment for extradition arrived, when the civil suit, having accomplished its purpose, could be dropped, and the extradition effected.

Neely's counsel, however, did not regard this method of administering justice with favor. He maintained that the Government was trying to hold his client prisoner under one law, in order that another law might be applied without possibility of delay. He contends that if he had waited until the order of extradition was signed, it might not have been possible to find a Federal judge to whom application for a writ of habeas corpus could be made in time to be of use. The Government could probably have hustled Neely off without a moment's delay. Technically, the application was premature. Until the prisoner was restrained of his liberty in the extradition proceedings, there was no ground for the application. But, as a matter of fact, the action for conversion was brought in aid of the extradition proceedings, and Judge Wallace was justified in taking cognizance of it. His action is in accordance with the best traditions of English law. This must be said, however much we may regret the delay which it occasions in bringing Neely to justice.

The Legislature which has just been elected in Alabama was chosen with a "mandate" to provide for the framing of a new Constitution, or the amendment of the old one in such a way as to eliminate the negro vote. There is no State in the Union represented by a worse Bourbon on this question than Senator Morgan of Alabama, who will be reëlected by the new Legislature. He has openly declared himself against allowing the exercise of the suffrage by any man who has a black skin, no matter how well educated he may be, or how much property he may have. But there is an element in the Democratic party which declares for fair play in this matter. This element finds a spokesman in the Birmingham *Age-Herald*, which insists that "the best thought of the State should be given to the devising of a plan that is better adapted to the State than either the Mississippi or Louisiana plan would be," the first of which it condemns for "trickery" and the second for "doubtful constitutionality." Instead of the "understanding" test in Mississippi, or the "grandfather provision" in Louisiana, the Birmingham Democratic editor recommends that the exercise of the suffrage be made dependent upon the paying of all taxes at least one year before an election. Under this system, the *Age-Herald* says, "a negro who acquires property would be entitled to a vote; and as such a negro would be a good citizen, he should be allowed to vote."

The celebration, in certain States, of an "old-home week" is a social event of some significance. Started in New Hampshire a year ago, the movement has this year spread to Maine, where last week was largely given up, in a number of the larger towns and cities, to appropriate festivities. New Hampshire is celebrating again this week, and there is talk of similar observances in Vermont. There would seem to be no reason why the enthusiasm should not extend to other States, particularly the older States of the East, where pride in a long and distinguished past affords a peculiarly favorable basis for appeal. It must be confessed that there is something more than ordinarily attractive in this idea of calling back to a community, for a few days in the summer, former residents, and asking them to make themselves, for the time being, once more "at home." On the other hand, there is always the possibility that the community itself, in spite of its gala dress, may nevertheless suffer somewhat in repute. If it be, as is so often the case in older New England, a community of slow or even backward growth, old-fashioned in the discreditable sense of being behind the times, the impression it is likely to make upon the visitor may be the reverse of flattering. The signs of a lack of public spirit—bad roads, unpainted buildings, unkempt dooryards, poor hotels, unsightly schoolhouses, dangerous and offensive sanitary arrangements—cannot pass altogether unnoticed by those who have had the good fortune of larger contact with the world, nor are they likely to enhance affection or respect. There may be temporary pleasure in a change of scene, a passing emotion at the awakening of memory and association, a spontaneous and healthy interest in what is quaint and odd; but the net impression will nevertheless be one of dulness, inanition, and decay. And yet, this very impression may help to stimulate in the visitors that New England public spirit which has already dotted the land with memorials such as public libraries, parks, hospitals, and other charitable foundations.

The dispatches from China are not yet such as to inspire confidence in the sincerity and good faith of the Chinese Government. That the Chinese are alarmed at the progress and success of the allies, and are ready to talk about peace, is probable enough; but that the conferring of the necessary power upon Li Hung Chang is anything more than a device for gaining time, is still to be proved. Moreover, the reports of continued disturbances in other parts of the country than the neighborhood of Pekin raise grave doubts as to whether the present Government has sufficient control of the situation to make a peace agreement effective. All advices point to the continuance of grave danger for the Ministers, and the necessity of pushing, without delay, the plans for their relief. It is highly probable, however, that the very fact of their imprisonment at Pekin is just now one of the best assurances of peace. If China could only get the Ministers safely out of the country, and rid itself of the burden which their presence imposes, it would have a much freer hand, and might continue indefinitely to set the world at defiance. But the repeated warnings, too explicit to be misunderstood, that the Chinese Government will be held strictly responsible for anything that may befall the foreign representatives, can but have had a sobering effect, and made a peaceful settlement somewhat more probable. As yet, however, none of the Powers seems inclined to purchase peace by any abatement of its previous demands, so that negotiation is likely to be rather a one-sided affair until China turns more of its fair promises into acceptable performance.

As we go to press, the latest news concerning the movements of the foreign troops is distinctly encouraging. The advance of the allied forces has been unexpectedly rapid, and the report that they had several days ago covered half the distance between Tientsin and Pekin can but raise hopes of their ultimate and speedy success. The temporary disappearance of Chinese opposition, while very welcome, must not, of course, be taken to indicate as yet a collapse of Chinese resistance; nor must it be forgotten that every mile traversed adds to the dangers of the allies, and that the most serious obstacles are yet to be overcome. The report that the reply of the United States to the Chinese peace overtures has the approval of the Powers, including Russia, and that the permission given the Russian Minister to withdraw from Pekin was not intended as an order, but rather as a test of Chinese good faith, is also encouraging. In the present juncture, and with reasonable grounds for anticipating success for the international arms, the withdrawal of any Power from the concert would be most inauspicious. Perhaps it is too much to expect that the rival claimants in China will not, under real or alleged apprehension of attack, follow the lead of Great Britain and take measures to protect their respective "spheres" and "concessions"; but there is everything to be gained just now by joint effort and sincere coöperation.

MR. BRYAN'S MANIFESTO.

It is impossible to deny that Mr. Bryan's carefully prepared speech at Indianapolis on Wednesday of last week was a great political and oratorical achievement. Fault may be found with it here and there—we shall point out what we consider the weak parts; but it is fair to say that neither Senator Hoar, nor Carl Schurz, nor ex-Gov. Boutwell, nor all of them together have produced a more masterly indictment of Imperialism. It is far in advance of anything its author himself has ever done before on any topic of public discussion. When we announced our intention not to support Mr. Bryan, although agreeing with him on the issue which forms the text of this speech, we said that we should tell the truth, as we were enabled to see it, about him and every other candidate and person and thing in this campaign. Our opinion of the Indianapolis speech, as a whole, is accordingly stated without reserve. It was so good as to prompt the advice of a single-speech campaign on the part of this candidate. It was skilfully calculated, not only to cause the greatest uneasiness in the McKinley camp, whose chief is quite unequal to any counter oratory, but to diminish support for the third-party movement. It fixes the issue and forces the fighting, and must, with candid judges, greatly raise the estimation of Mr. Bryan's statesmanship as well as intellectual calibre. Above all, it gives distinct pledges of future Executive action which advance the candidate beyond his platform. On the other hand, its elevated tone is opposed to so many speeches and sayings in Mr. Bryan's previous career, and especially in the last Presidential campaign, that it seems as though there might be two Bryans in public life.

Mr. Bryan's theatrical outburst about the crown of thorns and the cross of gold by which he captured the nomination four years ago, was not the index of a sincere mind. It was an *ad-captandum* address to a mob for vote-catching purposes. We find in the opening of his Indianapolis speech an *ad-captandum* appeal more refined and guarded than the one of four years ago, but of the same general scope and tendency. He says that the Republican party is dominated by influences which constantly tend to elevate pecuniary considerations and ignore human rights, as though the Democratic party were measurably free from influences of this kind. If there is any place where money counts for more than it does in Tammany Hall, or where its use is more brazen and flaunting, we have yet to hear of it. If there is any region where human rights are more systematically violated and trampled on than in the Southern States, where the Democratic party finds the bulk of its strength to-day, we should like to have it pointed out. Evidence to show how the Republican party tends to elevate wealth and ignore human rights is pointed out in detail by Mr. Bryan, and with a color of truth, but his suggestions and inferences are essentially false. The motives which prompt Republicans (and many Democrats) to favor the gold standard, and the national-bank notes in preference to Government paper, are quite apart from any thought of aiding rich people to make more money or of robbing the poor, and this Mr. Bryan knows very well. As to Trusts, any one desiring to tell the truth would say that the responsibility for them does not attach to any party; that, however bad they may be, they are an outgrowth of modern conditions of trade, and are without political affiliation except as the Democrats have made rather noisier attacks upon them, and have thus caused them to lean rather toward the Republicans.

The weakest part of Mr. Bryan's speech is that in which he defends his action with regard to the treaty with Spain. He says that he favored the ratification of the treaty in order to "end the war, release the volunteers, remove the excuse for war expenditures, and then give the Filipinos the independence which might be forced from Spain by a new treaty." He goes on to explain how much better it would be for the American people to rise up gloriously and bestow independence on the Filipinos than to put it in the treaty by an amendment and thus extort it from Spain. Now Mr. Bryan had his way in the matter of ratification, yet war did not end, the troops were not released, war expenditures continued and multiplied; and all these things were shown to be inevitable by Mr. Bryan's fellow-Democrats who occupied seats in the Senate at that time.

Mr. Bryan defines his Philippine policy by saying that, if elected, he will convene Congress in extraordinary session as soon as he is inaugurated, and recommend an immediate declaration of the nation's purpose, first, to establish a stable form of government in the Philippine Islands; second, to give the Filipinos independence just as we have promised to give it to the Cubans. Senator Hoar, in an interview published in the New York *Times*, criticises this part of Mr. Bryan's speech with much severity. He says that Mr. Bryan "knows that if there should be a Democratic majority in the House of Representatives equal to his wildest hopes, and if the Republican majority in the Senate should be reduced or wiped out altogether, so that there will be a tie—which is, I suppose, beyond his most sanguine expectations—there are still earnest and pledged Imperialists enough in the Democratic party to prevent any such action." The effect upon Congress, however, of the election of Bryan is not taken into the reckoning by Senator Hoar. It is conceivable not only that it might consolidate the Democratic party and make it obedient to Mr. Bryan, but that it might bring him some Republican support also, including that of Senator Hoar, who could not refuse to support a policy under Bryan to which he is committed under McKinley. Evacuation of the Philippines in some decent, orderly way, to be followed by self-government, is the substance of Bryan's programme. We can conceive of Senator Morgan's opposition to such a policy because he has been opposed to it from the beginning, but we cannot conceive of Senator Hoar's opposition. It is pretty safe to assume that, in the event of Bryan's election, he would have the support of Senators Hoar, Hale, Mason, Wellington, and Spooner in any decent and practicable method of doing in the Philippines what we have promised to do in Cuba.

It is too soon to estimate the probable effect of Mr. Bryan's speech in converting the Democratic party to the Anti-Imperialist views of their leader. We are still without evidence that the party, as a whole, had any definite ideas on this subject before the Kansas City Convention met, or that it has acquired any since; but if it generally reads this speech, it cannot fail to gain some, and, as the campaign progresses, it will be put to the necessity of repeating what Mr. Bryan has said. In this way we may look for an elevation of sentiment in that party which will be beneficial to the country in the future, regardless of the result of the coming election.

THE SITUATION IN THE PHILIPPINES.

The people of this country, we fear, now take but a languid interest in the elevation and assimilation of the Filipinos. Those matters have been put in charge of a large army and of an able Commission, and the public are very willing to leave all responsibility with them. Events in China now engage our attention, and the excitement of a Presidential campaign will soon exclude all other interests. Such a result was to be expected. It is in the nature of things inevitable. Most men have little time to spare for anything but their own business, and the government of our colonies will soon pass into the normal state of such governments. It will fall into the hands of a bureau, and the public will know nothing of what is done, nor care to know, except occasionally when some gross case of oppression or corruption occurs. Under these circumstances we can hardly regard the course of the New York *Herald* in maintaining a special correspondent in the Philippines as good "journalism." A person of such ability can be more effectively employed in China; but the picture of the Philippine situation which he has drawn in his letter of April 19 ought to be read by every one who has contended that Providence or destiny has made our people responsible for the government of those islands. If there is any such thing as responsibility, facts are indispensable to its intelligent assumption, and we shall attempt to present the facts, as stated by the *Herald* correspondent, in a summary way.

In the island of Luzon there are 216 separate garrisons, holding cities and villages in the twenty-seven provinces. A battalion of soldiers can now move from one of these points to another without meeting with any effective resistance, and in some regions without meeting any resistance at all. In this sense the island is pacified, and there are no more "insurgents." The armed natives are now called "ladrones," "robbers," and "bandits." There are no more battles, but nearly every day there are fights in which the Americans lose one or more, and the natives one hundred or more. After one of these fights a report is issued that a band of robbers has been destroyed; but before many days another fight occurs in the same region. The robbers may be scattered, but they do not remain scattered. Nevertheless, everything is quiet, according to the official statement. The mass of the people, it is claimed, desire American rule, but are unable to resist the small but pestilent minority, who tyrannize over them. Even with the aid of our army, the great majority of the people are unable to resist these robber bands, and reluctantly supply them with all the food and money that they need.

Officially viewed, the situation is that of tolerably complete conquest. American troops are in every province; native municipal governments set up in all the garrisoned towns; resistance confined to bands of robbers; the insurgent army and organization dissolved; the enemy's ammunition exhausted, and their guns captured; ports open and coasts guarded by our navy; and Aguinaldo a fugitive, not knowing where to lay his head. But the official view does not cover all the facts. The Filipinos have their commanders in the very districts occupied by our troops, their muster-rolls are kept up, although their soldiers are apparently peaceably working at their homes, and their arms are hidden. Twenty thousand rifles are believed to be still in their possession. Whenever a small force of Americans undertakes an expedition, the woods and hills become alive with enemies. After a short experience Aguinaldo realized that the Filipinos could not resist the Americans in a pitched battle. He directed his forces to disband, some of them to return to their homes and hide their arms, others to maintain a guerrilla warfare. Since the capture of Tarlac there has been no battle, nor any cessation of hostilities.

The *Herald* correspondent has investigated the captures of arms which have been reported, and finds their numbers exaggerated. An official bulletin posted at Manila gave an account of the surrender of 800 armed men; but only 40 rifles were actually taken. The bodies of armed men are too large to be described as mere bands of robbers, and many of them are known to be commanded by men who have been insurgent leaders from the beginning. The theory that these bands terrorize the whole population has no support in facts. The American troops have done the terrorizing. Their conduct in some actions has been so ferocious, and their revenge in many cases so terrible, as to make them dreaded and hated. The natives submit to the Americans because they are afraid of them; they secretly support the "ladrones" because they are their relatives and friends, and because they sympathize with them in their resistance. It is said that in every town occupied by our troops and regulated by native officers installed by us, there is a separate and secret organization conducted by the "insurgent" element. This organization collects taxes from a population which pays them willingly; and the officers whom we have selected to rule give the cause of the Filipinos all the assistance they can. The American officer in charge of one military district in the north of Luzon told the *Herald* correspondent that of the ninety-five presidentes appointed, not one could be trusted; and yet this is not a Tagalog district. In another district the general commanding declared that but three out of fifty-five presidentes appointed by us were trustworthy. In another district twenty-two of these presidentes are now under arrest. Manila and the region surrounding it are held down by 33,000 troops; but elsewhere our sovereignty is limited to the spots occupied by our garrisons. Our rule is detested; and there is no reason why it should not continue to be so.

The sole defence of the slaughter of the Filipinos offered by those Americans who defend our course on moral grounds, is that we are relieving a friendly and peaceful population from the oppression of robber bands. We are killing a few robbers, in order to protect the great masses of orderly natives. What evidence supports this theory? How many Filipinos are killed by these bandits, and how many by our soldiers? By whom has most property been destroyed? Whose taxes are heavier? The proof is overwhelming that we are forcing our rule on a sullen and reluctant people, by methods which will make us hated for generations. We have killed perhaps 30,000 Filipinos. Their children and relatives and friends do not love us for it. They are denounced for failing to appreciate our benevolent intentions; but since they do fail, our justification also fails.

THE ENEMIES OF CIVILIZATION.

The supposed massacre of the representatives of the Christian Powers at Pekin has aroused a spirit which it is impossible to regard without apprehension. There was a natural and legitimate demand for the punishment of the persons guilty of the reported cruelties, whether they were directly or indirectly responsible for them. But there went with this a clamor for vengeance, a cry for blood, that had little relation to justice, as it has come to be understood in civilized jurisprudence, and even less to Christianity. We have listened with a feeling of amused superiority to the story of the traveller who was assured, in response to his demand for the punishment of some members of an Asiatic tribe who had insulted him, that not only the malefactors should be killed, but also their wives and children and grandchildren, and their parents and grandparents. This barbaric travesty of justice, however, is what some people are now demanding. They insist that the injuries suffered by foreigners in China shall be revenged on the Chinese without discrimination. Even those who do not make this outrageous demand, take the position that the Chinese Government must be taught to be humane by an extensive slaughter of its subjects, whether innocent or guilty.

That this is no meaningless outcry is shown with painful clearness by the accounts which now reach us of the conduct of the Russian soldiers at Tientsin. These accounts cannot be dismissed as the inventions of newspaper correspondents. They are furnished by missionaries who have reached this country, and whose names are known. One of them asserts that when the Chinese officers in command of the Taku forts, whe seem to have done only their duty in resisting the attack on them, surrendered and offered their swords, the Russians refused quarter and shot them all down. He declares that, to his knowledge, in one village, the women and children were driven into the river and then shot. The wife of an American, a Commissioner of Customs at Tientsin, says that she escaped slaughter by the Boxers only to witness the most horrible excesses on the part of the Russian troops. These advance agents of civilization tortured and murdered Chinese mothers with babes in their arms, and tossed these helpless infants from bayonet to bayonet. After shooting and murdering, these soldiers pillaged and burned the houses of their victims. The President of the Imperial University of Tientsin, Prof. O. D. Clifford, who was one of the last to leave the city, declares that looting by the allied forces began as soon as they got the upper hand. He saw eight cold-blooded murders committed by the Russians, the victims being old and infirm Chinese. Mr. McIntosh, an American who was engaged in setting up machinery at Tientsin, gives similar accounts of the behavior of the Japanese. They waste no powder, he says, when they capture Chinese, and "lined up six one day, tied them together, and deliberately disembowelled them."

Warfare of this kind has made the names of Attila and Genghis Khan infamous throughout Christendom. Such barbarities, when committed by the Turks on the Armenians, raised cries of horror throughout Europe and America. But the Chinese have none to take their part. What we call civilization is arrayed against them. Innocent or guilty, they are to be swept away in promiscuous slaughter. The soldiers who have been guilty of these cruelties are our allies. Our own troops must march side by side with them, and witness their atrocities without interference. We trust that our own flag will not be disgraced by the active participation of our troops in these bloody outrages, and that even those who have been preaching the doctrine of doing evil that good may come in the Philippines, will shrink from the consequences of their principles when they see to what they lead in China. If we must fight, let us not fight like savages. If we must go to war to defend our imperilled citizens, let us carry it on like civilized men, and not in the spirit and not with the methods of the barbarians whom we are to slay.

The Japanese, it may be said, are heathens, and the Russians only half-civilized. But are they doing anything more than the German Emperor has called on his soldiers to do? Is there any other way to make the name of Germany so felt in China that for a thousand years to come China shall never dare even to look askance at a German? The *Evening Post's* correspondent in Berlin comments mournfully on the *Verrohung des Volkes*. Since the days of Jena and Austerlitz, one journal declares, Germany has not been, morally speaking, at so low a pass, so devoid of genuine Christian spirit. But the press generally comments on the Chinese troubles with brutal cynicism. "Not the question of right or wrong, not the provocations suffered by the Chinese—to a great extent from the Germans—are discussed." What will benefit Germany is the important matter, and the missionary work in China is denounced as detrimental to Germany's material interests, and calculated to embroil the Powers for a cause which has no concrete value. We cannot call the Germans uncivilized, and we must act with them now. But if a warning against entangling alliances were needed by our people, they have only to consider the policy in which they must participate.

We need not fear to be disgraced by *the conduct of the British forces, or by the spirit of the British Government,* we hope and believe. Yet an Englishman who represents the dominant influences, Prof. Edward Dicey, declares himself in favor of advancing British interests everywhere, at the cost of annexation and at the risk of war. The only qualification he admits "is that the country we desire to annex or take under our protection, the claims we choose to assert, and the cause we decide to espouse, should be calculated to confer a tangible advantage upon the British Empire." Are the people of America prepared to ally themselves with Powers governed by this principle? Can the cause of civilization and Christianity be advanced by governments or men actuated by such motives and animated by the passions which they inevitably arouse? No! for it is the end and essence of civilization to repress such passions and to subordinate such motives to more generous ones; and those who glorify war and conquest in the name of civilization are its deadliest enemies.

THE STATE OF INDIA.

The submission of the Indian budget to Parliament was the occasion for a statement of conditions which will be at present of world-wide interest. We may preface the summary which we shall give of the facts disclosed by this statement, and of the debate which it called forth, with the cheering comment that the drought in India appears to be at last ended, so that the destitution will at least not be aggravated. In this connection we may mention the coincidence, to which the Secretary of State for India, Lord George Hamilton, drew attention, between the fall of rain in India and the height of the Nile flood in Egypt. The Meteorological Department has discovered that, for the last twenty years, when the Nile flood has been low, there has been a failure of rain in India. Last year the flood was one of the lowest on record, and the failure of the monsoon was exceptionally bad. This year the Nile flood was normal, which inspired the hope that the monsoon, although delayed, would be satisfactory, as it seems to have proved. Of course, rain does not feed the starving, or create the draught cattle on which Indian agriculture depends; but it inspires hope, and enables those who are responsible for the lives of millions of destitute people and their future welfare to calculate what will be required, and to adjust their preparations with comparative accuracy to the coming exigencies.

Before referring to the facts presented by Lord George Hamilton, we may mention the debate which a proposed amendment to his budget brought out. A private member, apparently from the most humane motives, offered an amendment providing that the British Government should make a grant of £5,000,000 outright to the Government of India. The considerations in favor of such an amendment are too obvious to need mention, and even the *Times* editorially criticised the Ministry for refusing to accept it. It was unwise, the *Times* said, "to put forth the Imperial Government in the character of Mr. Gradgrind." As for one of Mr. Balfour's arguments, we cannot regard it as very weighty. The Government was running behind, he declared, on account of the South African war, spending, perhaps, £80,000,000 or £100,000,000 for that purpose, and it could not undertake the additional burden of contributing to famine relief in India. That is a much more substantial argument against war than against the relief of suffering, and the taxpayers who had unwillingly to help pay for slaughtering human beings might fairly insist that those who favored that policy ought to be willing to be taxed to save human life. The main argument, and on the whole we incline to think a conclusive one, is found in the demoralizing tendency of committing the British Government to the policy of helping that of India to support its charitable enterprises. Such a policy would seriously discourage charitable subscriptions by private individuals, who would justly argue that if they were to be taxed for such purposes, they could not make additional donations to enterprises for which the Government assumed the responsibility. Were the exigency extreme, even this argument might be overcome, but the facts show that the emergency is not overwhelming.

In the first place, in spite of the fact that within two years the expenditures of the Indian Government for famine reach the great figure of $65,000,000, the provisions made for calamities were so liberal that a deficit has not been created until the current year, when it will amount to some $4,000,000. The Indian Government proposes to borrow £3,000,000, which will presumptively carry it through the present trouble. The debt of India, it should be observed, exclusive of that incurred for public works of a remunerative character, is not large. It amounts, all told, to about £212,000,000, against which there are assets estimated at £182,000,000. The net indebtedness of India, therefore, after these disastrous years, is but £30,000,000, and the additional amount would be a slight additional burden. Moreover, the Indian revenue has decreased so little as to make it probable that a favorable budget can be soon presented. The total trade of India is not only greater this year than last, but greater than the average for the last five years. The imports have fallen off, but not so much as the exports have been enlarged. A remarkable fact is the heavy importation of gold, amounting to nearly Rx. 9,500,000 last year, while the Government was obliged to buy silver to the amount of £1,900,000 in order to increase the rupee circulation. As the Indian Government has on hand in London £1,500,000 in gold, together with a reserve of £7,000,000 in India, it is in position to maintain the stability of the currency. Contrary to some assertions, the remission of land-rent has been liberal, amounting to about £3,400,000. In spite of the famine, the ratio of mortality has been low, being very excessive in only one province, where for 100 years famine had been unknown, and where preparation for it had never been thought necessary.

As had been done on other occasions, Lord George Hamilton pointed out that the difficulty of the situation lay not in the lack of food, but in its distribution, and in the destruction of the cattle on which the industry of the people depends. Hence the immense value of private contributions administered by individual benevolence. Not that the officers of the Government have shown themselves lacking in humanity. On the contrary, they appear to have labored with really magnificent devotion; but their numbers are entirely insufficient. In the worst famine ever before known the area covered was 275,000 square miles; this year it is 420,000. In that famine 52,000,000 of people were affected; this year the number is 62,000,000. In the last drought, on January 1, there were 636,000 people on relief works; this year on that date there were 2,750,000. On July 14 in the former year the number in receipt of relief was 3,300,000; this year it was 6,100,000. Advances to native governments have been £2,436,000, and to individuals £1,100,000. No demand has been refused, Lord George Hamilton says; wherever it has seemed possible to save human life there has been no hesitation because of the expense. We cannot refrain from expressing admiration of the manner in which the overwhelming demands on the Indian Government have been met by its officers; and we find in their splendid, and we may fairly say successful, efforts an additional reason why the benevolent people of this country should continue to render aid which is so reasonably asked, so appreciatively received, and so effectively applied. *Bis dat qui cito dat.*

INTERNATIONAL CONGRESS OF COMPARATIVE HISTORY.

PARIS, July 30, 1900.

The very worst place for a learned convention is a great city. The worst possible time for it is the middle of summer, and the worst imaginable condition for its success is the presence at the same time of a vast counter-attraction, which throws all the ordinary life of the place out of gear. All these circumstances were combined against the second International Congress of Comparative History, which met at Paris during the week July 23 to 26. Add to all these that, for ten days before, Paris had been suffering from the most intense heat ever known there, and that this heat continued without intermission, day or night, during the week of the Congress, and one gains a sufficiently depressing idea of the chances of usefulness for such a gathering.

The plan of an international congress of historians seems to have originated with M. de Maulde de la Clavière, a gentleman of leisure, who secured the coöperation of a few of the best-known persons in the various departments covered by the scheme. The President was M. Gaston Boissier, Perpetual Secretary of the French Academy, the venerable writer upon the period of late Roman and early Christian history. At the head of the several sections into which the Congress was divided were such men as Henri Houssaye (general history and diplomacy); Glasson (institutions and law); Levasseur (social economics); Leroy-Beaulieu (religious affairs); Gaston Paris (literary history); and Saint-Saëns (history of music). This enumeration of the sections, to which should be added two others, on the history of science and of the arts of design, shows the vast scope of the material to be considered. The use of the phrase "Comparative History" still further indicates the purpose of the originators to include in this one comprehensive survey the whole activity of the human mind and the whole field of organized human society.

The preliminary announcements carried out even more fully this vastness of conception. In some sections an attempt was made to indicate specific lines of investigation, but even in these cases willingness was expressed to receive papers upon any related subject. As regards the range of material admissible to the proceedings of the Congress, therefore, everything pointed to the largest possible participation. The conditions of membership were arranged for on a similar scale of liberality. A local committee from each country was given the function of proposing members at twenty francs each to the central committee at Paris, and invitations were sent to the Government and leading educational institutions of the several countries to send delegates. The Chairman of the American Committee was Mr. James Gustavus Whiteley of Baltimore. The other members were Charles F. Adams, Edward Eggleston, Chief Justice Fuller, Cardinal Gibbons, W. Wirt Henry, George F. Hoar, C. E. Norton, Albert Shaw, George P. Wetmore, and Woodrow Wilson.

The result of this system of inviting membership in the Congress was that about eight hundred persons paid their subscriptions, thus providing the tidy sum of about 15,000 francs for publishing the proceedings. Each member was required to register in one section, but could receive the proceedings of any other section on payment of an additional ten francs. Of these 800 "members," not more than 200 were present at Paris. Hardly a person prominent in the "new school" of history in France, of which M. G. Monod would have been, perhaps, the best representative, was either seen or heard at the Congress. A partial explanation may be that some of these gentlemen were occupied with the incessant examinations which make the month of July a burden to the Academic world of Paris; but this can hardly account for the almost entire absence of the men who would have been the chief attraction to the Academic visitor. As to nationalities, so far as one could gather from the fragmentary and untrustworthy programmes, hardly a single German or Englishman or American was present, although a considerable number from these countries had paid their subscriptions. On the other hand, so large a representation came from the eastern parts of Europe that a good half of the papers read in the section of general history and diplomacy were by Hungarians or Rumanians, and these chiefly upon topics relating to those countries. The utter lack of "editing" in the programme may be shown by the fact that between these Danubian studies were interspersed articles on the private life of the Friso-Batavians by a French consul at Rotterdam, on the coronation of Henry of Luxembourg by an Italian Minister at Lisbon, and on the use of French in documents relating to foreign affairs by a delegate of the Swedish Government. Several papers were read in the absence of their authors by a Secretary of the Congress, who galloped through them with the single purpose of saving time. Indeed, all the readers seemed impressed with the vital importance of getting through as soon as possible without the least regard to whether they were understood or not.

Experience has shown what ordinary sense might have divined beforehand, that so far as "papers" at a learned convention are concerned, the only hope of success is in the most careful editing of the programme. Each session must have some distinct character, and this character must be given it chiefly by the lead of some recognized authority. There must be more papers offered than can be read, or specialists must be sought who will take the trouble to read for the sake of the common good. It is this difficulty in preparing programmes that has led many thoughtful scholars to vote the whole idea of conventions a hopeless nuisance. The impression made at Paris was that everything offered had been taken. No single session had any definite character, and one had to skip about from section to section to get any result whatever. Of the work of the Congress as a whole, no programme, even for a single day, was attempted. Only one or two sections tried to print their programmes, and these were frequently changed at the last moment. The others posted meagre written orders of the day. The section for religious affairs sat on two days only.

A judgment as to the value of the papers contributed will be possible only after they shall have been printed. From the few specimens your correspondent was able to hear, it may safely be predicted that they will not mark an epoch in the development of historical science. But it long since became a maxim among scholars that the "papers" are in any case the least important element of learned conventions. The real value of such occasions lies in the opportunity of meeting one's colleagues and comparing notes in the intimate association of the smoking-room or the piazza. On this, the social side, the managers of the Paris Congress did what they knew how to do. They arranged for two evening receptions during the Congress, one by M. E. Senart of the Institute, and one by Prince Roland Bonaparte, and invitations were given for a third, some days after adjournment, by the President of the Chamber of Deputies. The Congress was invited to a "lunch" at the Hôtel de Ville by the Municipal Council of Paris. One day was wholly given up to an excursion to the Château of Chantilly. All of these were, however, purely official occasions. No attempt was made to make the members of the Congress acquainted with each other, or to go beyond the strictest limits of French official courtesy. There was no social centre, such as we should expect to find in some hotel or club—in a word, the personal element was entirely disregarded.

The sentiment which prompted this undertaking, and the energy of the gentlemen who had it in hand, deserve hearty appreciation. It may, however, fairly be questioned whether an international enterprise from which the scholars of all leading countries, including the one which plays the host, prefer to buy themselves off at twenty francs, is really worth continuing. The question of the Rumanians in Hungary will get a handsome advertisement, but further direct results are not at present in sight. E. E.

RECENT RESEARCH IN HOMERIC TOPOGRAPHY.

FREIBURG IM BREISGAU, July 29, 1900.

It was not granted to Schliemann to witness the completion of the excavations at Hissarlik. With the exception of a corner on the south side of the mound which he held to be a part of the construction erected in the fourth century by Lysimachus, the discoverer of Troy failed to lay bare the massive escarped walls of the Homeric city, which now move the admiration of the visitor. Had the trench which Schliemann dug at the outset directly through the mound only cut deeper, the discovery of the outer line of walls would not have been reserved for Professor Dörpfeld, who, with the assistance furnished in 1893 by Mrs. Schliemann, and in the following year by the German Emperor, was enabled to put the finishing touch to the investigation of the hill at Hissarlik. During the last excavations superintended by Schliemann in person (in 1890), the discovery of Mycenæan vases, and of a part of a building of the Mycenæan period, now known to belong to the Homeric city, awakened doubts in the mind of the veteran explorer as to the correctness of his identification of the "second" ruined city with the citadel of Priam, a city that we now know to be at least a thousand years older than the Trojan war. The final report dealing with the latest excavations will appear next winter in a work entitled 'Troja und Ilios,' and will contain, apart from Dörpfeld's own contributions to the position of the nine or ten buried cities, the archæological researches of his co-workers, Winnefeld, Schmidt, Brückner, Götze, and Wilberg, with regard to the earlier as well as the later finds.

As I sit in the barrack occupied during so many campaigns by the great explorer of Hissarlik, I am reminded of another field of Homeric exploration begun by Schliemann and taken up afresh by his successor at Troy. The last act in the search for the acropolis of Priam is concluded. The great hillocks left by Schliemann and Dörpfeld at Hissarlik will probably not be disturbed for many years. Meanwhile the centre of archæological interest has shifted from the Iliad to the Odyssey, and the topography of the later epic is being examined anew in the light of a novel theory recently put forward by the Director of the German Institute at Athens. It was the good fortune of the writer to be present at some of the recent explorations, the aim of which was the *location of the palace of Ulysses.*

When one turns from the Iliad, with its sharply outlined description of the Trojan plain and of Ilion itself, to the indistinct setting of the scene of the Odyssey, we seem transplanted from places actually traversed by the poet to a region whose reality is only less hazy than the fairy isle of the Phæacians. Is not the Odyssey the mere fabric of the poet's vision, and Ithaca the faintly defined scene of the story of Penelope's constancy, of the insolence of her suitors, and of the return of her long-absent lord? This is the belief of many scholars at the present day, and so Hercher argued nearly forty years ago. Only "antiquarian hallucination," exclaimed the German skeptic, "can equate the Homeric topography with the actual topography of the island of Ithaca." But Hercher's skepticism denied even the reality of Troy, and his actual researches in Ithaca were confined chiefly to the isthmus near the bay of Vathy and to Mount Aëtos, where early in the century Gell had placed the scene of the Odyssey. On this peak, which crowns the narrow isthmus separating the northern from the southern part of the island, a long line of explorers from Gell to Schliemann sought for the palace of Ulysses. But, apart from various topographical reasons, the height of Aëtos (380 metres) is ill-adapted for the abode of a Homeric prince; and all the pottery found there is Greek, not Mycenæan.

As early as 1805, Leake proposed to locate the home of Ulysses much further to the north—at the end of the bay of Polis, and nearly opposite the tiny island Daskalio. This, the current view, has received the support of such distinguished scholars as Bursian, Lolling, and Partsch, who is the author of the latest monograph on the subject (in the ninety-fifth supplementary part of *Petermann's Mitteilungen*, 1889).

Into the details of the controversy it is not my purpose to enter. No one will now venture to dispute the conclusion of Professor Dörpfeld, who, in pronouncing against the Mycenæan character of the remains on Mount Aëtos, has effectually disposed of one of the two sites in question. Nor, according to the same unrivalled student of Mycenæan building, does the case stand better with the other theory. Thanks to the liberality of a Dutch gentleman, Mr. Goekoop, excavations were conducted this spring near the Bay of Polis. The archæological evidence here, too, speaks with no uncertain voice. No one of the hills likely to be made the seat of a Mycenæan palace contains any trace of walls or of pottery of the archaic period. Where, then, if they existed in reality, are the halls of Ulysses, nay, where is Homer's Ἰθάκη? Is the Ithaca of to-day not the Ἰθάκη of the poet?

To this question Prof. Dörpfeld returns the answer: Homer's Ἰθάκη is Leucadia, and the palace of Ulysses, if remains exist, must be sought in no other of the Ionian islands. Through his courtesy I am enabled to present a brief statement of the arguments that have led Prof. Dörpfeld to this conclusion—a conclusion that cannot fail to awaken at least the hostility of surprise. In enumerating the various contentions of Prof. Dörpfeld, I refrain intentionally from all criticism.

(1.) In the attempt to locate the Homeric Ἰθάκη it is an error to leave Leucadia out of consideration on the ground that Strabo (10.2.8) declares it to have become an island at the time of its occupation by the Corinthians (about 600 B. C.); and, granting that the Corinthians did cut through the isthmus between Leucadia and Acarnania, such a transformation of nature would no more make Leucadia into an "island" than the cutting of the isthmus of Corinth has made an "island" of the Peloponnese. But, apart from this, geological evidence shows that Leucadia always was an island, and that the present passage (500 to 1,000 metres wide), which is now rapidly closing up, despite the channel made during the English occupation—a channel which, we may add, the Greeks have long promised to renew—existed from an immemorial period. From the time of Homer to the sixth century B. C., there existed no definite knowledge with reference to the position of the various islands enumerated by Homer as forming the kingdom of Ulysses. Errors thus naturally arose, and Leucadia received its present name from the Λευκὰς πέτρη mentioned by Homer (ω 11) and famed in antiquity as the scene of Sappho's death-leap, while the present Ithaca received the name of the Homeric Ἰθάκη in consequence of the belief that Leucadia had not been an island in the Homeric period. According to Dörpfeld's view, Same or Samos was the Homeric name of the Ithaca of to-day, and Doulichion is Cephalonia, a name not mentioned in the epic. Zacynthus is of course Zante. In confirmation of this localization of the four chief islands ruled by Ulysses is the observation made by travellers in Elis, who, on looking out upon the Ionian island, see them naturally in the following order: Leucadia, Cephalonia, Ithaca, and Zante; and in the "Hymn to Apollo," l. 428, from the same point of view, the poet mentions first the "lofty mountain" of Ἰθάκη, then Doulichion, next Same, and finally "woody Zacynthus."

(2.) Homer describes Ἰθάκη as χθαμαλὴ πανυπερτάτη πρὸς ζόφον, while the other islands are ἄνευθε πρὸς Ἠῶ τ' Ἠέλιόν τε. It is significant that Strabo interpreted this to mean that the island of Ulysses lay "near the mainland" and "farthest to the north." The word ζόφος, which has caused no end of difficulty, refers not to the west but to the north and west or the northwest. It is a striking circumstance, as Partsch has shown, that there exists among the inhabitants of the Ionian Islands a confusion with regard to the points of the compass. Peasants in Ithaca have been heard to misname north and south and north and west; the north side of the lagoon of S. Mauro is called *banda di ponente* in the report of a Venetian admiral cruising in Ionian waters in the fifteenth century; Bondelmonte says that the journey from Corfu to Leucadia by way of Paxos proceeds in an easterly direction; and in Corfu a deme in the north is called Epizephyrii, and one in the south bears the name Apiliotæ. However we may account for it, the fact of this strange orientation remains; and it may reach back to a very early period. The passage to the west, to Sicily, was often in historical times not direct but to the north by way of Leucadia. In Homer, Hermes leads the souls of the dead to Hades by way of Oceanus and the λευκὰς πέτρη.

(3.) One part of the flocks of Ulysses grazes on Ἰθάκη, another feeds upon the ἀκτῇ ἠπείροιο ("promontory of the mainland"). It is natural to assume that they were separated only by a narrow passage such as intervenes between Leucadia and

Acarnania. The distance from Ithaca to the mainland is three hours by steamer.

(4) In α 171 Telemachus asks Athene, who has appeared to him in the guise of Mentor: "How did the sailors bring thee, for I do not think that thou camest on foot"—surely a senseless question on the part of the "prudent" son of Ulysses unless there actually existed a possibility of coming on foot, viz., along the mainland and then by ferry across the narrow strait, which Dörpfeld takes to be the Ῥεῖθρον.

(5.) The Ῥεῖθρον was situated at the foot of "woody Neïon," which is generally taken to be a part of Neriton, the chief mountain of Ἰθάκη. Now Pliny expressly says that Neritos was a mountain in Leucadia, which was thence called Neritis.

(6.) Between Ἰθάκη and Samos, Homer places the tiny island Asteris, where the suitors lay in wait for Telemachus with the purpose of slaying him upon his return. This island, he says, is distinguished by having a double harbor (ἀμφίδυμοι λιμένες). The ancients doubted the existence of Asteris, and Schliemann thought it had completely disappeared. Gell found it in Daskalio, an islet in the sound between Cephalonia and Ithaca. This is out of the question, since Daskalio has no such harbor. According to Dörpfeld, everything becomes clear if Leucadia and Ἰθάκη are one; and I can attest from personal observation that Arkoudi, a small island between Leucadia and Ithaca (μέσσῃ ἁλί, δ 844;, does possess a remarkable double harbor on the east side, shaped something like an inverted T. Here vessels can lie sheltered now from the north, now from the south wind.

The visit that I made to Leucadia in company with Professor Dörpfeld was chiefly confined to the search for ruins of a Mycenæan palace in the neighborhood of the deep bay on the east side, latitude 38 degrees 42 seconds. On the western side of this beautiful sheet of water were found two sets of ruins. The first, more directly opposite the mouth and distant about a mile from it, is certainly Hellenic, but further to the south, on an eminence rising perhaps half a mile from the bay, are the remains of a stronghold that may be of the Mycenæan age. The pottery on the surface was, however, of the Greek type. Here Prof. Dörpfeld proposes to excavate at the expense of Mr. Goekoop, and here he thinks to find the home of Ulysses. And even if this quest should prove fruitless, his belief in the correctness of his theory is so strong that he will search for promising localities still further to the south near Katocharion.

On the southeast side of Leucadia is a small bay bearing the suggestive name Συβῶτα, which Prof. Dörpfeld thinks may possibly have a chance connection with the swineherd Eumæus, who was the first to greet his master after he had been carried to his native island by the Phæacians. An examination of the inlet in question does not disclose any close resemblance to the harbor of Phorkys with its enclosing rocky headlands; nor would the nymphs have had a comfortable time of it in the neighboring cave, into which I scrambled with no little difficulty. But Professor Dörpfeld does not, of course, rest his theory on the identity of the Συβῶτα and Phorkys harbors; the peasants tell of a larger cave further along on the south shore, which is indented with numerous bays. Here future examination will be made, and here even the cave of the Naiads, which the mere student of poetry would be content to leave as the creation of the poet's fancy, may appear to gladden the heart of the Homeric topographer.

HERBERT WEIR SMYTH.

BOUTROUX'S PASCAL.—I.

PARIS, July 26, 1900.

It is a difficult task to write an essay on Pascal. It has been undertaken by M. Émile Boutroux, a member of the French Institute, for Hachette's valuable collection of "Les Grands Écrivains Français." Among our great writers, Pascal holds a high and almost intangible place. He is not only a model of style, one of the creators of that fine language of the seventeenth century which marks the highest point in the development of French literature; he is as great in the world of thought as in the world of style—his name goes with those of Descartes, Malebranche, Nicole. He is a philosopher, and his attempt to reconcile human reason with religion will lend a perpetual interest to his famous 'Pensées.'

Blaise Pascal was born at Clermont-Ferrand on the 19th of June, 1623. He belonged to an old family of Auvergne. His father was royal *conseiller en élection* for Bas-Auvergne in Clermont, and afterwards second president in the *cour des aides*. Of four children which he had, three survived, Gilberte, who became Madame Périer; Blaise, and Jacqueline. Pascal's father was a good mathematician, and directed in all its details the education of his son Blaise. He taught him Greek and Latin only after he had reached the age of twelve; the study of mathematics was to begin only at fifteen. To his great surprise, he found his son, at the age of twelve, making geometrical figures, and occupied with the demonstration of the 32d proposition in the first book of Euclid. Young Pascal rediscovered the demonstration; his father made him a present of the 'Elements of Euclid,' which he read in his hours of recreation. The intelligent boy was surrounded with intelligent men, among whom was Father Mersenne, who delivered weekly lectures which were the origin of the Academy of Sciences.

An event which powerfully impressed the young mind of Pascal was the publication of Descartes's 'Philosophical Essays.' The introduction to it is the famous "Discours de la Méthode," which may be compared, for its importance, to Bacon's 'Novum Organum.' The Cartesian method, founded on the direct observation of facts, psychological as well as material, became the method of the seventeenth century. Descartes did not admit any external authority; he confronted man directly with his own reason and his own conscience. To this may be added that the "Discours de la Méthode" is a monument of the French language; it has a solidity, an elevation, and a clearness which have never been surpassed.

Pascal was not sixteen years old when he conceived the idea of an "Essay on Conic Sections." He wrote it in 1639 and 1640, but did not publish it, because he was indifferent to reputation. but Mersenne sent an extract of it to Descartes. At the age of eighteen he invented a mathematical machine which may be considered the mother of all the modern machines of the same kind.

Pascal and his father Étienne were almost free thinkers; they experienced religion after an accident which happened to the father in January, 1646, when he fell on the ice. He was taken care of by two pious gentlemen, who made the father and the son acquainted with the works of Jansen, Arnauld, and Saint-Cyran. The spirit of Port-Royal entered into them through these works, which were to them a sort of revelation. Port-Royal taught them that original sin had corrupted man and had made him a slave of his depravity. If man wished to be converted, he had to choose between God and the world, he had to add a supernatural life to his natural life, he had even to renounce a vain love of science, since science spoke only to man's intelligence, and had nothing to say about the inner truth. The teachings of Jansen and his disciples were much in accordance with Pascal's character. He was one of those whom the idea of duty seduces, and who cannot give themselves to it by halves. Jacqueline, sister of Blaise, was converted to the same ideas. She was only twenty years old, and was fond of the world; she abandoned it, and gave herself entirely up to God.

Pascal's health had never been good; he overworked himself; he suffered from many discomforts, and the lower part of his body was almost paralyzed. We have only one good portrait of him; it was taken from life by Domat—a mere drawing in red pencil, on the cover of a book. It gives the idea of extreme delicacy; the eyes are unnaturally large, the forehead is immense, the nose aquiline, and, though the mouth is almost sensual, the expression of the face in general is very pure and idealistic. It was during the period of his conversion and of his religious ardor that he composed the "Prayer to God for a good use of sickness." It is very curious and characteristic; it describes sickness as the means of conversion and sanctification. In 1647 Pascal went to Paris to consult doctors, and became acquainted with M. Singlin, who was the confessor of the *solitaires* and the religious women of Port-Royal. Jacqueline accompanied her brother, and made several visits to the house of Port-Royal; she was very well received by Mother Angélique Arnauld, the abbess; she did not, however, enter the convent, as her father was opposed to it.

Pascal never interrupted his physical researches. In 1641, he was preoccupied with the question of the vacuum, though he had not heard of Torricelli's experiments on the subject. Galileo had demonstrated that air was heavy. Torricelli had seen in that fact the explanation of the rise of the mercury in the vacuum of the barometer. Pascal endeavored to show experimentally that the mercury rose and fell according to the depth of the atmosphere above it, and he gave directions to his brother-in-law, who made the experiment in the Puy-de-Dôme. The old theory, which declared that nature abhors a vacuum, fell to the ground. Pascal repeated the experiment at the Tour St. Jacques, in Paris, and it was proved that the mercury rises and falls according to altitude. Every schoolboy knows now what was then unknown. Curiously enough, this scientific success occasioned Pascal's first quarrel with the Jesuits; they accused him unjustly of having robbed Torricelli of his invention.

Étienne Pascal died on September 24, 1651. His loss was keenly felt by his children. It inclined Blaise even more to a religious life and to religious ideas. He set forth his ideas on death in a fine letter which he wrote to M. and Madame Périer. Jacqueline, after the loss of her father, entered Port-Royal; she was only twenty-six years old. Her profession took place in July, 1653. Thereupon, by a singular contrast, Pascal gave himself up again to the world; but contrasts are the law of the most exceptional natures. Pascal became for a time almost futile; he wrote verses for a lady (they were found in a château near Poitiers at Fontenay-le-Comte):

"De ces beaux lieux jeune et charmante hôtesse," etc.

He paid court in Auvergne in 1652 and 1653 to a lady who was a *femme savante*, and was called the Sappho of the province. The Chevalier de Méré (who left some opuscules now known only to bibliophiles) told him there was great profundity in the world, that there was much for the philosopher to learn in it. It was in that period that Pascal wrote a curious essay, 'Discours sur les Passions de l'Amour,' which Victor Cousin found in a manuscript at the Abbey of Saint Germain-des-Prés. We must not attribute too much importance to writings which were, so to speak, the wanderings of a great mind; but Pascal, even in these dissertations, was always himself, and could not help giving to all subjects a certain originality and a great elevation.

The years 1653-54 are those during which Pascal made his principal mathematical discoveries, which I will not analyze here. Towards the end of 1653, as he had attained the age of thirty, he experienced for a second time the feelings which had once turned him towards the severities of Jansenism. From this time, we see Pascal constantly struggling against the instincts of nature, against over-confidence in himself, against pride and the desire to be approved by the world. He experienced grace, but not without a painful effort and a struggle. He was now in constant communication with his sister Jacqueline, with *ces messieurs*, as they were called, of Port-Royal. After listening to a sermon by M. Singlin, on November 23, 1654, he fell into a sort of trance, and thought he felt directly the presence of God; he had a kind of revelation. All doubts were expelled from his mind; he was in presence of the living God. There was no more reason for arguing, for discussing; inspiration had taken the place of reason.

Port-Royal, the modest abbey near Versailles, was one of the oldest convents of the order of Cistercians. It was founded in the thirteenth century. At the beginning of the seventeenth the Abbess was a young child, eleven years old, Angélique Arnauld; as she grew older she undertook to reform the Abbey. She shut it out completely from the world, surrounding it with strong walls. Her parents came to see her; she received them in the *parloir*, and explained to them her resolve. They remonstrated in vain; she was determined to separate the Abbey from the influences of the outside world. In 1626 the community transported itself to Paris; in 1636 the Director was Duvergier de Hauranne, Abbé of Saint-Cyran, a friend of Jansen. He had larger views than Mother Angélique. He aimed at nothing less than a complete reform of the Church, and looked upon Port-Royal as the centre of this regeneration. The strict morals of Port-Royal were to be opposed to the easy and worldly morality of the Jesuits. Sainte-Beuve has told in his admirable work on Port-Royal the story of the first Jansenists. We can easily imagine how Pascal was drawn into the holy circle.

Correspondence.

THE DEMOCRATIC PARTY BLIND TO ITS RESPONSIBILITIES.

To the Editor of The Nation:

Respected Friend: The magnitude of the wrong done to the people of the United States by the Democratic party, when it forced the silver question into the present campaign, becomes more and more apparent the more it is considered. Altogether because of this piece of folly, the American voters who wish to protest against the policy of Imperialism, are deprived of an opportunity to do so effectively. It is obvious that when two distinct issues must be voted for or against together, the people are practically prevented from expressing their judgments, by ballot, in regard to either of them. No one can vote for McKinley, for the sake of stable money, without strengthening the cause of Imperialism; and no one can vote for Bryan, for the sake of preserving our free institutions, without strengthening the cause of an unstable standard of values. If those in control of the Kansas City Convention had been on the payroll of the Imperialists, they could not have done more to insure the success of the most portentous aggregation of Jingoism and capitalistic effrontery that the world has ever seen. Even from the standpoint of Populism, the present importance of the slumbering silver cause must seem relatively insignificant, in view of the aggressive activity and persistent mendacity of those who are using their official vantage-ground to insidiously supplant a constitutional republican form of government by an oligarchic plutocracy.

The silver issue was voted on four years ago, and the decision was very decidedly against it, and if a majority of the people are anxious to reverse that judgment now, they are keeping wonderfully quiet about it, to say the least. There is every reason to suppose that the number of those who would feel greatly aggrieved by having the silver question simply shelved for the time being, compared with those who will be deterred from voting the ticket because of a feeling that they may be helping to afflict the country with another financial convulsion, is not greater than as one to a hundred. And, if such is the case, it is plain that the silver issue has become merely a tonic for Imperialism.

Since the last Presidential campaign, Imperialism has unexpectedly and accidentally become a vital issue, distinctly as a nursling of the present Administration. And, manifestly, the Democratic party, which is now our only effective reliance as an opposition party, owes it to the nation to open the way for a definite and emphatic decision of this supremely important and far-reaching issue. If the Democratic platform had said, in effect: "Although the theoretical attitude in regard to silver assumed by the party four years ago is unchanged, yet, in order that the more pressing issue of Imperialism may be met, squarely and definitely, by the people, the party is hereby pledged, if successful, to abstain, during the next four years, from all legislation that would disturb the gold standard," and further made it plain that there was no juggling with words in regard to Imperialism, there would now be a fair prospect that the snake in the bosom of the nation, which is threatening to strangle all there is of republicanism in our system of government, would be cast off for ever. Surely the matter is of sufficient importance to warrant the trouble of rectifying the mistake even yet. In no way could the leaders of the Democratic party so thoroughly demonstrate their patriotism and their manhood as by rising above false pride and the fear of ridicule, and reconstructing their too hasty work, on which so much that is of inestimable value may depend. A mere declaration that this or that is the paramount issue does not measure up to the importance of the one supreme issue. The question of Imperialism cannot be met squarely by the people unless the silver issue is practically eliminated from this campaign.

If Bryan should be elected on the present platform (and his election is extremely doubtful only on account of the platform), he could not possibly feel that he was the choice of the people in regard to either one or both of the issues; but only that he is in office as the result of a sort of blind gamble, on the part of the people, on the choice of two evils. From his own point of view he could not regard it as a victory either for silver or for freedom, and the uncertainty in regard to what they are really voting for, if they vote for him, will dampen the interest of the people, and result in losing tens of thousands of votes merely for want of a clear issue. Oh, for an Isaiah to proclaim for us that "the leaders of this people cause them to err, and they that are led of them are destroyed."

Freeman Stewart.

Philadelphia, 8th mo., 10th, 1900.

MALARIAL VIEWS OF POLITICS.

To the Editor of The Nation:

Sir: In your issue of August 2, I find a somewhat agitated communication from Louisville, Ky., from which I beg leave to repeat the following passage:

> "Mr. Bryan is also pledged against 'government by injunction'—that is, against any efficient repression of riots. The unruly elements would soon feel who is holding the reins, and anarchy, like that which raged in Pittsburgh in 1877, or at Chicago in 1894, would spread from the Aroostook to the Golden Gate."

In the first sentence quoted, the delightful logic should be noted by which to be "against 'government by injunction' " is made the equivalent of being "against *any* efficient repression of riots." Upon which I remark that on this logic you yourself, sir, are clearly "against" the repression of riots, for you have opposed "government by injunction," and very forcibly. Such arguments are not reasonable—they are malarial; and malaria, especially the political malaria of Kentucky, is just what should be kept out of the present discussion. Let us not have the strenuosity on one side of this campaign matched by lugubriosity on the other. The old classic hymn,

"My thoughts on dreadful subjects tend,"

may have done good theologic service in its time, but hardly furnishes inspiration for a political campaign. The dread forebodings, given with an easy comprehensiveness of divination to which Ithuriel's spear "were but a wand," of what will certainly happen if Mr. Bryan is elected, recalls the doleful assurance of an old-time politician in Massachusetts, who solemnly pledged his word that if a certain candidate were elected Governor, "hell would take place in ten minutes." The dreaded candidate was elected, but there was no noticeable irruption from the infernal regions; the world did not come to an end then, nor will it with the election of Mr. Bryan, an event which now seems not so improbable but that we may as well prepare ourselves to accept it if necessary. The predictions of cataclysmal disasters to occur in case the other fellows win, are old and well-worn features of political campaigns.

In your appended comment you say, "We propose to do what we can to prevent this people from giving its seal of approbation to the present misruler of its destinies." This is a wise and patriotic purpose, involving the sum of existing political virtues and obligations; and if it can be gained in any other way than by the election of Mr. Bryan, will you not kindly explain to your perplexed but not discouraged readers, what that other way is, that they may strive with you to attain it? "Lead kindly light, amidst the encircling gloom," and show the better way.

FRANCIS FISHER BROWNE.

CHICAGO, August 8, 1900.

[Our way is very simple—to refrain from voting for McKinley, and to persuade as many other people as possible to do so.—ED. NATION.]

SILVER DOLLAR CIRCULATION.

TO THE EDITOR OF THE NATION:

SIR: In your editorial comment (No. 1832) on the money of the country, in an article under the head "What Bryan Has Done and May Do," you say (in relation to the number of silver dollars): "Large quantities are not generally within his reach. Nearly all are absorbed in the circulation of the country." Now I see by a Treasury statement in to-day's paper the following, viz.: "Of the half-billion of silver dollars . . . 430,341,739 are in the Treasury, . . . and only 66,429,476 in circulation." Did you mean that the great bulk of them were in circulation through the means of "silver certificates"?

It seems to me a strange thing that, after all the claims which the Republicans have made for the credit of having established the country on a firm gold basis, they should fall back on a flaw in the act by which this desirable condition was accomplished to show the very act itself was not to be relied on. Shall we ever be on a really firm basis as long as any portion of the 460,000,000 legal tenders are in existence?

Yours truly, JAMES B. NOURSE.

WASHINGTON, D. C., August 11, 1900.

[Of course we meant that the bulk of the silver dollars in the Treasury could not be used by the Secretary for the purpose named, since they are held for the redemption of outstanding silver certificates. We shall *not* be on a firm basis as long as Government legal-tender notes are in existence. A clear and strong statement of the reasons why we shall not, is contained in the late Professor Dunbar's article on "The Safety of Legal-Tender Paper" in the *Quarterly Journal of Economics*.—ED. NATION.]

"NEWS-MAKING."

TO THE EDITOR OF THE NATION:

SIR: Theophrastus, in chapter viii. of his 'Characters,' has anticipated some features of our modern journalism, as shown especially in recent 'news' from China. I quote from a translation of 1715:

> "News-making properly consists in relating things which have neither been said nor done, but are invented by the newsmaker and put together at his will."

A reflection on the next page is less "up to date": "I have often wondered what this sort of men could possibly propose to themselves, by inventing and spreading such groundless stories."

They had no telegraph then, and no printing-press. Mr. Sheng doubtless finds his account, or thinks he does, in this "inventing and "spreading"; and his colaborers, the brilliant young foreign correspondents, have their salaries to earn. Like A. Ward's banknote engravers, "they make money, and good money too"—probably including an extra tip for each intellectual triumph in the way of an unusual sensation. F. M. B.

S. BETHLEHEM, PA.

THILLY AND WUNDT.

TO THE EDITOR OF THE NATION:

SIR: In a recent number of your journal the reviewer of my 'Introduction to Ethics' states that my classification of ethical systems, as presented in the table on page 128, is substantially borrowed from Wundt. In order that the reader may judge for himself, will you kindly permit me to give Wundt's scheme, and then append my own? I quote from the English translation of Wundt's 'Ethics' (vol. ii., p. 164):

> "We thus obtain the following classification: I. *Authoritative Ethical Systems.* These may be divided into *politically* and *religiously* heteronomous systems. They either avoid taking any account of ends, or affiliate with some one of the autonomous systems as regards the question of ends. II. *Autonomous Ethical Systems.* (1.) *Eudæmonism*, under the form of (a) Individual Eudæmonism or Egoism; (b) Universal Eudæmonism or Utilitarianism. (2.) *Evolutionism*, under the form of (a) Individual Evolutionism; (b) Universal Evolutionism."

Here is my scheme: "What makes an act right or wrong? The *Theological School* says: The will of God; The *Common Sense School:* Conscience; The *Teleological School:* The effect of the act. What is the effect? Pleasure, says *Hedonism;* Perfection, says *Energism.* Whose Pleasure? Pleasure of self, says *Egoistic Hedonism;* Pleasure of others, says *Altruistic Hedonism.* Whose Perfection? Perfection of self, says *Egoistic Energism;* Perfection of others, says *Altruistic Energism.* The *Theologico-Teleological School* says: An act is good because God wills it, and God wills it because of its effects."

I also request the reader to compare the classifications given in the following works with Wundt's and my own: Bain's 'Mental and Moral Science,' 1868; Lecky's 'History of European Morals,' 1869; Sidgwick's 'Methods of Ethics,' 1874: Jhering's 'Der Zweck im Recht,' 1877; Paulsen's 'System der Ethik,' 1889; Seth's 'A Study of Ethical Principles,' 1894; Hyslop's 'Elements of Ethics,' 1895; Dorner's 'Das menschliche Handeln,' 1895; Külpe's 'Einleitung in die Philosophie,' 1895; Lipps's 'Ethische Grundfragen,' 1899. A perusal of these books will show that there is little difference in the classifications of the different authors, and that modern Ethics has reached a certain degree of fixity with respect to its divisions. My own scheme resembles the schemes of all of these writers in some points, and differs from them in others. So does Wundt's. Mine is no more like Wundt's than Wundt's is like Bain's and Sidgwick's and Jhering's. It is to be noted that not one of the writers mentioned in the above list gives credit to anybody. And there is no reason why he should; no more than why a modern biologist should give credit for using the current zoölogical classifications.

Yours respectfully, FRANK THILLY.

COLUMBIA, MO., August 9, 1900.

CREDIT TO WHOM CREDIT.

TO THE EDITOR OF THE NATION:

SIR: In your No. 1832, in your paragraph concerning Mr. Moorfield Storey's 'Life of Charles Sumner,' in my "American Statesmen Series," you say that Mr. Storey has not mentioned the name of Mr. E. L. Pierce, though relying throughout upon the elaborate biography written by that gentleman. It seemed to me, and may seem to others, that this was an intimation that Mr. Storey had gathered his material in Mr. Pierce's field, and had not been polite enough to say, "Thank you." Now, Mr. Storey was in friendly relations with Mr. Pierce, and it was to him that Mr. Pierce said: "You will find all the facts in my book"; therefore, a suggestion of discourtesy is very painful to Mr. Storey, and it becomes my duty to say that if any error has been committed, it has been wholly my own.

I, as editor, advised Mr. Storey that it was not worth while, nor required by literary usage, that he should insert a prefatory note whereof the sole purpose and contents would be to say that he had sought aid at the great reservoir which Mr. Pierce had conspicuously and laboriously prepared. Of course he had; if he had not, that fact would have demanded admission, to his own discredit. I may have been wrong, but I do not think that such obvious acknowledgments are required by literary courtesy. In all subjects, there are some authorities which all writers are assumed to use. Furthermore, I happen to have been so close to Mr. Storey in his preparation of this volume that I am fortunately able to say that, for all the matters of a public nature, concerning Sumner's statesmanship, Mr. Storey relied upon and used the works of Mr. Sumner very much more than he did the biography by Mr. Pierce. With the full historical introductions and the many letters to Mr. Sumner, embodied in the works, Mr. Storey was able to find the substantial and sufficient basis for his own views and treatment. His personal knowledge, also, of the latter part of Mr. Sumner's life was thorough and abundant for his needs. The originality and merit of his work would have been more apparent had I not been under the unfortunate necessity of greatly curtailing it in order to bring it within the rigid limits of my volumes.

JOHN T. MORSE, JR.
Editor American Statesmen Series.

BOSTON, August 9, 1900.

[We are glad to find Mr. Storey acquitted of the omission advised by his chief—and ill advised, as we must hold. The general public cannot be assumed to know of the existence of "authorities which all writers are assumed to use." Notoriously, too, the epitome thus easily made may bring far greater pecuniary profit to the appropriator than did the laborious original to its author, who at least should have the credit of having opened the quarry to the public.—Ed. Nation.]

THE ORIGIN OF CHESS.

To the Editor of The Nation:

Sir: The writer of a recent communication on "The Origin of Chess" (*Nation*, No. 1824, p. 457), says of that Indian romance, the 'Harshacarita' of Bāna, which is ascribed to the earlier half of the seventh century of our era, and in which occur some more or less evident allusions to chess: "It cannot be supposed, since the game is mentioned familiarly as being well known at that time, that chess was then a novelty, and the conclusion appears to be inevitable that the game existed by the middle of the sixth century at least."

This allegation, rendered into the idiom of the fortieth century in a treatise compiled by an investigator into the origin of either croquet, lawn tennis, polo, or euchre, or into the genesis of the electric telegraph, the sewing-machine, or the telephone (just where the writer is commenting on a work attributed to the nineteenth century), would read as follows: "It cannot be supposed, since the game [instrument] is mentioned as being well known at that time, that croquet [the telephone] was then a novelty, and the conclusion appears to be inevitable that the game [instrument] existed by the middle of the eighteenth century at least." It is proper enough, perhaps, in discussing the oldest known date of an art, or invention, or custom, or anything else, to conceive a period of probability antecedent to the period of certainty—a sort of preliminary what-might-have-been before the actual what-was—and your correspondent has evinced much modesty in limiting this permissible play of his fancy to merely a century, or less. But what shall we say of Dr. Duncan Forbes—author of various Oriental linguistic works of repute—who, in his 'History of Chess' (London, 1860), claims thirty or forty centuries as the proper duration of his "period of probability"? or of the erudite Spaniard, Don José Brunet y Bellet, a principal object of whose 'El Ajedrez' (Barcelona, 1890) is to demonstrate the Egyptian nativity of chess, who takes us back to the pyramid-builders of Memphis and the tomb-painters of Thebes? or of Capt. Hiram Cox, a writer on "The Burmah Game of Chess" (*Asiatic Researches*, vii., Calcutta, 1801, pp. 490-91), the flight of whose imagination is quite as extended as that which Dr. Forbes permits himself to enjoy? or of Mr. Eyles Irwin, a believer in the inventive spirit of the Chinese (*Irish Academy Transactions*, v., pp. 53-63), who insists upon antedating his facts to the extent of finding chess "on record two centuries before the Christian era"? or of his successor in the same remote field, Mr. H. F. W. Holt, who, in a valuable paper (*Asiatic Society Journal*, July, 1885), seems half inclined to go back, with the Chinese historical books, to B. C. 279, but who finally, with commendable self-sacrifice, concludes that "it is *probable, in the absence of any evidence to the contrary*, that it [chess] has been played, very much in its present form, from the time of the Tang dynasty, commencing in the seventh century"? It is hardly necessary to mention the multitude of minor compilers, like Mr. Francis Douce (*Archæologia*, xi., 1794, pp. 397-410), with his "immemorially known in Hindostan," or like the well-known chess practitioner, Mr. H. E. Bird ('Chess History,' London, 1893), who disdains such an un-English author as "Linde," and announces his patriotic determination to stand by Dr. Forbes, and to endorse "the existence of the game called the Chaturanga at the time stated by him." Even historians of the European game, finding it impossible to obtain any evidence whatever of the presence of chess north of the Mediterranean before the eleventh century, must likewise have their "period of probability"—so gentle and honest a man as Sir Frederic Madden (*Archæologia*, xxiv., 1832, pp. 203-91) stretching back 300 years in order to embrace such an interesting character as Charlemagne.

How are these varying claims to be met and reconciled? Where shall we draw the line in the case of such imaginative seekers after truth, who over-zealously carry their explorations even beyond and behind the truth? Writers on the early ages of chess—particularly, for some inexplicable reason, those who wield English pens—find it extraordinarily difficult to avoid this conjectural style of research. The very newest (English) historian of chess, whose labors are not yet completed, feeling the cold severity of modern criticism, protestingly cries out, with a groan quite audible to the attentive reader: "We *must*, however, sometimes indulge in a little reasoning by analogy!" and devotes himself assiduously to the revival of the oft-confuted fancies and fables of the "reasoning by analogy" school of chess historical investigation. As will be seen below, even some Oriental scholars of our own immediate day—of deservedly high standing—will not quite give up this baneful habit of the past. Why cannot investigators be content to tell us what they know, without adding to it what they guess?

I shall attempt to cite, in their order, the recent additions to our knowledge of the earliest years of chess history.

(1.) In 1878 Prof. Theodor Nöldeke of Strassburg—a noted Semitist, but distinguished as well for his familiarity with Pahlavi—published a German translation of the so-called 'Kārnāmak,' a Pahlavī text of some importance. It is this work to which, as your correspondent tells us, Dr. Nöldeke "assigns the date 590-628 A. D." To its interesting character, as containing an early mention of chess, your correspondent is, I believe, the first to call the attention of the English-reading public. Dr. Nöldeke styles his version the 'Geschichte des Artachshir i Pāpākan,' being the story of Artaxerxes, son of Pāpak (Bezzenberger's *Beiträge*, 1878, pp. 32-69, and as a *Separat-Abdruck*, 1879, the pagination being the same in both). The translator characterizes it as an historical romance (p. 23). It is, in fact, a fanciful account of the education and adventures of a Persian noble, or prince, very similar, in manner and matter, to those prose and metrical tales which abounded in the literatures of Europe during the twelfth and fourteenth centuries from Italy to Iceland—from the *romans* and *fabliaux* of the South to the spurious sagas (*skröksögur*) of the North. The very sentence which includes the word *catrang* (chess)—its solitary occurrence—might be paralleled from a score of the story's European congeners. The young prince has been confided by his father to Ardawan, the Iranian King, who seemingly took an immediate interest in him, and "ordered that he should accompany his own sons and knights to the chase and to the games of ball," which command the prince obeys, and soon excelled his comrades in those manly diversions. "With God's aid he became doughtier and more skilled than all of them in ball-play, in riding, in chess *(catrang)*, in hunting, and in other accomplishments." The footnote to this sentence (p. 39) says of the word "*catrang:* das ist natürlich das Original des regelrecht daraus umgebildeten arab. *shatranj*, wie es wieder, im Einklang mit alter Tradition, die indische Urform *caturanga* reflectiert." Dr. Nöldeke is something more than cautious in his ascription of a date to the 'Story of Artachshīr.' He says (p. 23): "Die *genaue* Bestimmung der Abfassungszeit ist nicht möglich; doch spricht Manches dafür, dass es *aus der letzten Zeit* der Sāssānidenherrschaft stammt, etwa aus der Zeit des Chosrau II. Parwēz (590-628 n. chr.)"—that is, some time during the reign of that monarch. The earliest known reference in literature to this Pahlavī tale—a very indistinct one, as Dr. Nöldeke explains—occurs before the eighth century, and the second about 815-16, while the first direct mention of it (pp. 24-25) is by Mas'ūdi, the Arabic historical encyclopædist, in 943-4. Not content with these conservative statements, he goes still further, and informs his readers (p. 27) that there is no available linguistic testimony to assist in determining the age of the composition, and continues: "Ich glaube kaum, dass auch die wenigen gründlicheren Kenner des Pehlewī im Stande sind, die sprachliche Entwickelung in der echten Pehlewī-Literatur mit einiger Sicherheit zu beobachten." But since the publication of his version Dr. Nöldeke would appear to feel even greater doubt about his suggested date, for he has recently spoken of it as "Die *ungefähre* Zeitbestimmung (590-628) für die Abfassung des 'Kārnāmak.'" Professor Jacobi of Bonn is apparently in accord with Dr. Nöldeke as to the age of the book. He considers that "the mention of chess in the 'Kārnāmak,' under a name which is a reversion to the Sanskrit *caturanga* [unter seinem auf das Sanskrit *caturanga* zurückgehenden Namen], is, *at the most*, fifty years older than its oldest Indian mention (in Bāna)"—that is to say, in the 'Harshacarita,' to which we shall shortly come.

A book written anywhere between 590 and 628 may at least be more properly spoken of as belonging to the seventh than to the sixth century. Therefore Dr. Van der Linde ('Quellenstudien zur Geschichte des Schachspiels,' pp. 5, 6), with his inveterate but sometimes brusque good sense, gives the assigned date of the biographical *novella*, and then adds that it is thus, "let us say, from the seventh century." In truth, we have first to take it for granted, on what is expressly stated to be the slenderest evidence, that the 'Kārnāmak' was composed at some time between 590 and 628, and then to assume that the author wrote it precisely in the first (590-600) of the nearly four decades which make up the reign of Khosrau the Conqueror—a surmise in no wise susceptible of proof, hardly susceptible of probability. Having stretched our credulity thus taut, we are entitled to consider—somewhat in the English style of "reasoning"—that we *may have* succeeded in pushing back, with a certain amount of documentary aid, the authentic history of chess to a date earlier, by ten years or less, than the beginning of the seventh century. Beyond this, except on the wings of fancy, we cannot yet get.

(2.) In 1892, Dr. Nöldeke, with the same ability, described, in a section of his 'Persische Studien,' II. (Philosophical-Historical Proceedings of the Vienna Academy, CXXV., Abhandlung xii., pp. 20-26), another and briefer Pahlavī production, giving an account of the invention of the games of chess and nard (the oldest form of "tables," or backgammon). It had been previously edited, as one of four short legendary narrations in Pahlavī, by a native Parsī scholar at Bombay (1885), who had added to the text versions in English and Guajarati; while Dr. K. G. Salemann, director of the important Asiatic Museum in St. Petersburg, had printed at that city, in his 'Mittelpersische Studien' (1887), the text, accompanied by a German rendering. The narrative of the birth of the two ancient games differs slightly—though, so far as chess goes, not essentially—from the familiar Arabic accounts which we owe to Mas'ūdi (10th century) and Ibn Khallikān (13th century), both cited in detail by Van der Linde ('Geschichte des Schachspiels,' i., pp. 1-5). Dr. Nöldeke considers the Pahlavī story to be somewhat earlier than Mas'ūdi's, and not improbably the source of Firdausi's fabulous tale in the 'Shahnama.'

(3.) In 1896 appeared an essay by Prof. Hermann Jacobi of Bonn, "Ueber zwei ältere Erwähnungen des Schachspiels in der Sanskrit-Litteratur" (*Zeitschrift der deutschen Morgenländischen Gesellschaft—ZDMG*, as it is usually cited by the Germans—Vol. L., ii.; pp. 227-33). These "two mentions of chess" were found in the 'Haravijaya' of the Kashmīr poet, Ratnākara, one of the so-styled "artificial" or mannered epics, made up of fifty elaborate cantos, which was composed about the middle of the ninth century; and in the 'Kāvyalankāra' of another Kashmir poet, Rudrata, belonging to the same period. At the date of Dr. Jacobi's publication these were the earliest known allusions to chess in Indian literature. The first citation forms part of a single figurative strophe in which the poet refers, as it seems, to the game of chess, enumerating the "four wings" or members—footmen, horsemen, chariots, elephants—descriptively applied alike to the military and chess array. The reference has something of the obscurity of an Icelandic *kenning*. The second authority sets forth chess matter of a far more satisfactory character, and is especially interesting because we learn from it not only that the "knight's tour" was well understood in the homeland of chess 1,000 years ago, but also that, then as now, the knight's route over the chess-board was employed as a medium or setting for metrical puzzles precisely in the modern manner.

(4.) Early in 1897 Prof. Edward B. Cowell of Cambridge, and Mr. F. W. Thomas, Librarian at the Indian Office in London, produced (*Oriental Translation Fund*, N. S. II.), a version of the 'Harshacarita'—"the earliest attempt at historical romance in Indian literature." This tale by Bāna was first brought to the notice of European students by our compatriot, Dr. Fitzedward Hall—so long and so pleasantly known to the readers of the *Nation*—in the introduction to his edition of Subandhu's 'Vāsavadattā' (one of the kāvyas, or artificial court epics, like the already-cited 'Haravijaya'), published in the *Bibliotheca Indica*, No. 116 (Calcutta, 1859). Dr. Hall discovered three more or less perfect MSS. The story has since become, in India, a favorite subject for treatment. There have been editions of the text at Jummu (Kashmīr) in 1879, Calcutta in 1876 and 1883, and Bombay in 1892, and it has been illustrated by a volume of English notes (Bombay, 1882), while an annotated excerpt was printed at Benares in 1883. In the notes to the London version no historical importance was attached to the passage or passages containing allusions to chess.

(5.) In 1897 also (*Athenæum*, July 24), Prof. A. A. Macdonell of Oxford published his note on "The Earliest Mention of Chess in Sanskrit Literature." I did not allude to this in my previous communication (*Nation*, No. 1823), nor to his subsequent essay on 'The Origin and Early History of Chess,' for the same reason that I refrained from referring to Professor Jacobi's model paper, namely, because I was calling attention generally to some standard works on chess history, and especially to the subject of chess in Hebrew literature. Professor Macdonell first condenses, in a clearly worded paragraph, the 1896 paper of Professor Jacobi, and then turns his attention to the allusion which he had observed in the 'Harshacarita.' "The passage," he says, "which is found on p. 55 of Vidyâsāgara's edition (Calcutta, 1876), and which contains a series of puns, is thus rendered by Professor Cowell, in his recently published translation of the 'Harshacarita' (p. 65): 'Under this monarch . . . . only bees (*satpada*) quarrel in collecting dews (dues); the only feet cut off are those in metre; only chess-boards (*astapada*) teach the positions of the four members (*caturanga*).' In his poetical romance 'Kadambari' ("Bombay Sanscrit Series," p. 88, l. 15), Bāna perhaps also refers to chess with the compound *astāpada-vyāpāra*, 'practice at the chess-board,' though it is interpreted as 'game at dice' in the smaller St. Peterbsurg dictionary." As to the date of the 'Harshacarita,' it is known that it was written under the patronage of King Harshavardhan, who ruled over Northern India from 606 to 648. In his most useful 'History of Sanskrit Literature,' just issued, Professor Macdonell has an excellent but too brief note on the origin and migration of chess (p. 421), and likewise gives a fuller account of Bāna's 'Harshacarita,' accompanied by some translated paragraphs, but with no further reference to the chess-passage including the words *caturanga* and *astāpada* (chess-board).

(6.) In January, 1898, Professor Macdonell prints in the Asiatic Society's *Journal* (pp. 117-141) his dissertation—to which I have alluded above, and which richly merits separate publication—on "The Origin and Early History of Chess." In this the citation from the 'Harshacarita' is repeated, and the remark added that "this reference is particularly clear, as both the game and the board are named together." No additional passages from Bāna's writings are quoted. Excellent as the essay is in almost every respect, its interest is somewhat marred by the author's inability to resist the temptation of occasional recourse to conjectural methods. Thus, at the end of his comment on the 'Harshacarita' reference, he anticipates the "inevitable conclusion" of your correspondent: "Occurring in the middle of an enumeration of notions familiar to the Indian reader, it justifies the conclusion that chess was well known in the beginning of the seventh century. The game must, therefore, have undoubtedly existed in India at least by the middle of the sixth century A. D." Such "reasoning by analogy" would have enabled Swift to cross the Irish Channel by steamer, and Dr. Johnson to run up from Lichfield to London by rail. Professor Macdonell would find it difficult to furnish any more trustworthy basis than his own surmise (p. 131) for the assertion that "It [chess] *may have* become known in Spain under the Saracen ruler Hakem II. (961-76)"—which is merely an inference from the fact that Hakem was a lover and collector of books, and *may have* had Arabic chess-codices in his library, which *may have* communicated a knowledge of chess to the people of Spain. Again, he says of the (original or two-handed) *caturanga:* "It is *quite possible, pace* Dr. [Van der] Linde, that dice was combined with the primitive form of chess"—an allegation which at present it would be *quite impossible* to substantiate satisfactorily. His pages likewise show some bibliographical oversights, such as the use of "Linde" for Van der Linde (we do not usually say "Werf" for Van der Werf, nor even "Hagen" for Von der Hagen), 'Heydebrand's Bibliography of Chess,' and so on. There are also indications of unfamiliarity with the technical terminology of the games he treats, as when he uses "piece" for "pawn" (p. 133), and, in the case of *nard* (p. 126, note), "squares" for "points"—but the Arabic word (*beit*=house) is the same in both games. Van der Linde's 'Geschichte' (1874), too, is abundantly cited, but no use is made of that author's 'Quellenstudien' (1881), a work in some sort supplementary to the earlier one. To Professor Macdonell's apparent ignorance of that volume is to be partly ascribed his extraordinary omission of any notice of the 'Kārnāmak'—the work which, so far as we now know, contains the most probable first mention of the game in any literature; for, while citing the account of the little Pahlavī chess-tractate by Dr. Nöldeke (1892), he shows no knowledge of the same savant's 'Geschichte des Artachshīr' issued fourteen years before. He would have found it duly chronicled—as we have stated—in the 'Quellenstudien' (pp. 5, 6). The allusion (p. 136, note) to Thomas Hyde, author of the 'Historia Shahiludii' (1694), as "the great Orientalist" is a deserved tribute to one who exhibited the same remarkable ability as Bodley's Librarian and as Oriental professor. Of all English writers on the antiquity of chess, Hyde was the most erudite and the least fanciful; hence Theodor Nöldeke ('Persische Studien,' ii., p. 25) characterizes him as "Der, nicht bloss für seine Zeit, wunderbar gelehrt und dabei *sehr verständig urtheilende* Hyde."

(7.) It was in 1898 also that Mr. F. W. Thomas, one of the translators of the 'Harshacarita,' published a note on "The Indian Game of Chess" (*ZDMG*, LII., ii., pp. 271-2). He begins by calling attention to Professor Jacobi's paper, and then examines the more recently noted Indian allusions to the game, citing, first of all, the above-mentioned 'Vāsavadattā' of Subandhu—a contemporary of Bāna—whose popular tale was "probably written," says Professor Macdonell, "quite at the beginning of the seventh century" ('Sanskrit Literature,' p. 332). The passage pointed out (Fitzedward Hall's ed., Calcutta, 1859, p. 284) is a comparison of frogs leaping up in the fields, during the rainy season, to the chess-men jumping up on the squares of the chess-boards. Thereupon Mr. Thomas cites an additional sentence from the 'Harshacarita,' in which he finds lurking a reference to chess. It is strongly figurative, speaking of a person "contracting a frown which . . . darkened the chess-board of his forehead"—a simile suggested, it is thought, by the "furrowed lines" of the brow ('Harshacarita,' transl. by Cowell and Thomas, p. 6, note). The expressions, "black squares," "mottled squares of a chess-board" (p. 272), denote ignorance of the fact that the old Asiatic chess-boards were never parti-colored, the squares being indicated simply by black lines (that is, outlined). The custom of coloring the squares originated in Spain. Perhaps I may add that the author, being English, does not succeed in closing his communication without taking his readers into the realm of hypothesis: "We find, therefore, that Professor Jacobi's interesting researches may be extended *at least* as far back as the first half of the seventh century, and *it may be permissible to conjecture* that the invention of chess belongs to a considerably earlier period."

(8.) Later in 1898 (*ZDMG*, LII., p. 512) Prof. Ernst Windisch, editor of that invaluable German Oriental journal, comments in a brief note, "Zu The Indian Game of Chess," on the statements of Macdonnell and Thomas in regard to the 'Harshacarita,' qualifying them somewhat—"da man das *astāpada* [=a board having eight squares in each row] auch zu andern Brettspielen benutzt haben kann," and of the citations from Bāna declares that they are "allerdings unsicher." He regards as more trustworthy the one from the 'Vāsavadattā:' "Die deutlichste Beziehung auf das Schachspiel scheint unter den neuen Stellen die von Thomas aus der 'Vāsavadattā' angeführt zu haben."

To sum up, the most ancient documentary indications of the existence of chess date from about the beginning of the seventh century A.D.; the possibly earliest and certainly least dubious mention of it occurring in a (Persian) biographical romance styled the 'Kārnāmak." The dialect of this tale is Middle-Persian, disguised by the medium in which it is written—a cryptogamic and otherwise bizarre form of orthographic expression known as Pahlavi. Neither the Sanskrit nor any other literature belonging to the native land of chess affords us, as yet, any assuredly earlier evidence of the game's existence. The oldest Arabic utterances relative to chess have been gathered with great diligence by the Arabist Gildemeister, and are published by Van der Linde ('Quellenstudien,' pp. 6-12). None of them are earlier than the eighth century, and of those cited from that period not one is wholly free from doubt, either in respect to its character or to the exactness of its date. It is needless to say that these three contiguous regions—Northwestern India, Persia, and Arabia—witnessed the earliest developments of the game.

I trust that it will not be considered inappropriate if I allude here to the later literature of ultra-Indian chess. The treatment of it, when compared with the essays that appeared in the earlier years of the century, exhibits a marked improvement. Mr. H. G. Hollingworth's "Short Sketch of the Chinese Game of Chess" (North China Asiatic Society's *Journal*, N. S., iii., pp. 107-112, Shanghai, 1866) is full and accurate, if lacking a little in lucidity. He gives two games, one of twenty-one and the other of forty-seven moves. "The Chinese Game of Chess as compared with that practised by Western Nations," by Mr. K. Himly, which appeared in the same journal (N. S., vi., pp. 105-121, 1871), is replete with literary and philological interest, but the author, after dallying with still earlier dates, declares that "we must be content with fixing the period of the invention before the year 100 A. D." (that is, if it were invented in China, which he is far from asserting). Of greater technical interest than these is a third paper in the Shanghai *Journal* (N. S., xxiii., pp. 248-284, 1889), by Mr. Z. Volpicelli, entitled "Chinese Chess." It is profusely illustrated with diagrams, and reproduces a number of end games. The explanations are intelligible and precise. Somewhat earlier than the last-named article is Mr. H. F. W. Holt's "Notes on the Chinese Game of Chess" (Asiatic Society's *Journal*, XVIII., iii., pp. 352-365, London, 1885), a compilation of interest, although the writer sets out with the erroneous statement (p. 353) that "Van der Linde, in his exhaustive work 'Geschichte und Litteratur des Schachspiels,' argues that Chaturanga is always used of an army, and never of a game, by the old Indian poets." To the author's opinions on the chronology of the Chinese game I have already alluded. In regard to the chess of Japan, there is no information more recent—so far as I have been able to ascertain—than that contained in the brief but admirable account of Mr. V. Holtz, "Das Japanische Schachspiel," in the *Mittheilungen der deutschen Gesellschaft für Natur- und Völkerkunde Ost-Asien's* (5tes Heft, pp. 10-12, Tokio, 1874). It gives representations of the board of eighty-one squares and of the men, furnishes concise but clear notes on the moves of the figures and the rules of the game, and records an actually played game of forty-one moves.

W. F.

Notes.

The Smithsonian Institution has undertaken to receive pledges of subscription for the International Catalogue of Scientific Literature resolved on at a conference held last June in London. This catalogue is to begin with the new century, will contain both an author and a subject-index, and will comprise the following subjects: Mathematics, Mechanics, Physics, Chemistry, Astronomy, Meteorology (along with Terrestrial Magnetism), Mineralogy (with Petrology and Crystallography), Geology, Geography (Mathematical and Physical), Palæontology, General Biology, Botany, Zoölogy, Human Anatomy, Physical Anthropology, Physiology (including Experimental Psychology, Pharmacology, and Experimental Pathology), and Bacteriology. To each of the seventeen subjects at least one volume will be devoted, and publication will take place in four quarterly groups as soon as possible after January 1, etc. The price fixed is a pound a volume, or $85 for the set, and the enterprise must look to a three years' support on these terms from not less than 300 subscribers. Ninety sets have been guaranteed for Germany, Great Britain, and Ireland; and forty-five, it is hoped, may be ordered from the United States. September 15 is the latest date at which this country should respond. All correspondence should be addressed to the Secretary, Prof. S. P. Langley.

Charles Scribner's Sons' list of autumn publications includes 'Military Reminiscences of the Civil War,' by the late Gen. J. D. Cox; 'Recollections of a Missionary in the Great West,' by Cyrus Townsend Brady; 'Paul Jones, Founder of the American Navy,' by Augustus C. Buell; 'A History of the American Slave Trade,' by John R. Spears; 'A Literary History of America,' by Prof. Barrett Wendell; 'Oliver Cromwell,' by Theodore Roosevelt; 'The Referendum in America,' by Ellis Paxton Oberholtzer; 'The Life of Sir Joshua Reynolds,' by Sir Walter Armstrong; 'Prince Charles Edward,' by Andrew Lang; 'A General History of Europe, 300-1900,' by Profs. Oliver J. Thatcher and Ferdinand Schwill; 'Napoleon at the Height of His Power,' by Imbert de Saint-Amand; 'A History of Education,' by Thomas Davidson; in Professor Saintsbury's "Periods of European Literature," 'The Transition Period,' by G. Gregory Smith; 'Italian Cities,' by E. H. and E. W. Blashfield, in two volumes; 'Songs and Song Writers,' by Henry T. Finck; 'The World of the Great Forest,' by Paul du Chaillu; 'Mooswa, and Other Animals,' by W. A. Fraser; 'Overheard in a Garden,' by Oliver Herford, with his own illustrations; 'A Garden of Simples,' sketches and essays by Martha Bockée Flint; 'The Ways of Men,' by Eliot Gregory; 'Oriental Rugs,' by John Kimberly Mumford, with colored and other illustrations; 'Songs of Two, and Other Verses,' by Arthur Sherburne Hardy; 'Later Poems,' by Julia C. R. Dorr; 'The Toiling of Felix, and Other Poems,' by Henry van Dyke; 'The Jack of All Trades,' and 'The Outdoor Handy Book,' by Daniel C. Beard; 'Fairies and Folk of Ireland,' by William Henry Frost; Mr. Barrie's 'Tommy and Grizel,' and 'The Works of Tobias Smollett,' with an essay by W. E. Henley.

Early in October, Little, Brown & Co., Boston, will issue a 'Study of James Martineau,' by the Rev. W. A. Jackson.

Doubleday, Page & Co.'s fall announcements include 'The Harriman Expedition to Alaska,' illustrated; 'Through the First Antarctic Night,' by Frederick A. Cook, M.D., a member of the *Belgica* expedition; 'Newest England' (Australia and New Zealand), by Henry D. Lloyd; 'Our Land and Land Policy,' by Henry George; 'Life of Henry George,' by his son and namesake; a translation, by Lionel Strachey, of Strylenski's 'Memoirs of Countess Potocka'; 'William Cotton Oswell,' the friend of Livingstone, by W. Edward Oswell; 'The Shakspere Country,' by John Leyland; a new Shakspere text edited by Prof. Mark H. Liddell in forty volumes; 'A Woman Tender-on each plate have been similarly measured by two observers. The total number of plates now definitely measured is 126, and the conversion of the measures into rectangular coördinates has been executed for 102 plates. For 87 of these, the work is completely examined and the final copy prepared for the press.

—Mr. Albert Matthews contributes to the Transactions of the Colonial Society of Massachuetts for January-April, 1898, just published, a remarkably learned and interesting paper on the euphemistic terms "hired man" and "help." It has usually been held, though not without dissent, that both terms arose from the disinclination of Americans either to call themselves anybody's "servants" or to submit to being so called. Mr. Matthews shows that the history of the usage in question is much more complex than any one has hitherto suspected. "Servant" is nowadays restricted, in common speech, to a man or woman employed in domestic service. In the colonial period, however, the word had a much wider signification; it was applied to laborers, mechanics, schoolmasters, articled students in a lawyer's office, and so on, as well as to domestics, and it included freemen as well as slaves. No odium whatever attached to the term. There were three distinct classes of servants: slaves, "indented servants," and "hired servants." The distinction between the last two classes is convincingly brought out by Mr. Matthews in a multitude of quotations. In addition, there were "hired freemen"—that is, ordinary free citizens, not belonging to the technical category of servants, who had temporarily "hired themselves out." This last class, Mr. Matthews supposes, were originally meant when "hired men" were spoken of. Thus, "hired man" was a merely descriptive term and in no sense a euphemism. With the growth of democratic feeling, however, the dislike now felt for the word "servant" manifested itself with constantly increasing force. The colonial system of white servitude gradually disappeared, and, there being but two great classes, slaves and freemen, the terms "hired man," "hired woman," etc., came to be used as euphemistic names for free servants, and have continued as survivals despite the abolition of slavery. Of course all these processes were gradual, and their history is admirably pictured in Mr. Matthews's illustrative quotations. Whether the term "hired man" was brought over from England, where it was in use as early as the fourteenth century, or whether it arose independently in this country, is still an open question. Mr. Matthews has not found it in any of the thirteen colonies till 1697, but he has discovered it in a law passed in Barbados in 1652.

—The history of "help" in the sense of "domestic servant" is even more curious. In colonial times the word was applied to any one called in to render temporary assistance, as opposed to a regular servant or employee. There was no euphemism about it. Thus, it was in common use for a transient "supply" or assistant in the ministry, and, in its application to labor of other kinds, it existed side by side with "servant" at a time when that word carried no odium. When, however, "servant" began to be looked at as a contemptuous or disgraceful appellation, "help" began, like "hired man," to lose its exact and purely descriptive sense, and to be employed as a euphemistic substitute. This usage, however, appears to have been somewhat local in its scope. The old quasi-technical meaning of "help"—that is, "temporary assistant"—was doubtless brought over from England, where "helps in the kitchen" are mentioned as early as 1596. Mr. Matthews deserves the thanks not only of students of lexicography, but of all who take an interest in the social history of America, for his scholarly monograph.

—The long set of the "Jesuit Relations" (Cleveland: Burrows Brothers Co.) is now advancing by leaps and bounds to its conclusion. Vols. lxiii.-lxvi. comprise documents which relate to a space of forty-five years, 1667-1712; and although the first twenty years of this period have already been dealt with in part, the mere fact that the remaining twenty-five years can be disposed of so rapidly shows the dwindling of the material. Instead of official reports, the private letters of the missionaries supply the chief part of Jesuit records at the end of the seventeenth century. Appeals to the Governors of the province, which are rare fifty years earlier, become prominent, and there are traces during Frontenac's régime of friction between Church and State. While the dangers of life among the Indians have somewhat lessened since the early days, the discomforts and the risk to health are still the same. We have encountered nothing in the whole series which seems more pitiful than the epitome which Father François de Crepieul writes of his cross among the Montagnais. It begins: "The life of a Montagnais missionary is a long and slow martyrdom; is an almost continual practice of patience and of mortification; is a truly penitential and humiliating life, especially in the cabins and on journeys with the savages." This general statement is then supported by ample details of suffering which cannot for a moment be questioned—the suffering which comes not so much from artificial torture as from hunger, thirst, and outrageous filth. At the opening of the eighteenth century we meet with an instance of greater regard for the wants of the missionaries in a list of supplies furnished to the Jesuits who are settled among the Illinois. Prunes, Spanish wine, oil, flour, and spices, all in small quantities, are forwarded to the men whose fund of vital energy is fast being exhausted on the banks of the Mississippi. Another interesting bill of items is contained in volume lxv. It is a return of the revenues which the Canadian Jesuits possessed in 1701. At this time the order derived from New France only 3,540 livres a year. The greater part of the amount came from land rents in or about Quebec. The crown also contributed 7,215 livres, and investments at home added 4,000 more. Altogether, the budget seems very modest when the extent of the mission field is considered. One excellent feature of volume lxvi. is the long bibliographical note which Mr. Paltsits contributes regarding the 'Lettres Édifiantes' of the Jesuits.

—'The Remarkable History of the Hudson's Bay Company,' by Dr. George Bryce (Scribners), is a book which has been many years in preparation, and represents an intimate personal knowledge of the Northwest territories of Canada. Naturally it suggests comparison with 'The Great Company' of Mr. Beckles Willson, which we have already reviewed at some length. In one respect we consider neither work to be quite satisfactory, viz., in the matter of illustrations. Photographs of the scenery and animals of the Hudson's Bay region are not within easy reach of every one, and yet there must be a good many of them somewhere. Clear reproductions from photographs showing the character of the country and people, and of the animals in their haunts, would have been a strong feature, but neither Mr. Willson nor Dr. Bryce has made it a point to collect a mass of such material. For the rest, Dr. Bryce expands his narrative just at the moment where Mr. Willson grows concise. The best part of Mr. Willson's volume is that which deals with the origin of the Company and the early rivalry between French and English. He is less good after the Peace of Utrecht than before it. Dr. Bryce passes rapidly over the first stage, and concentrates his notice upon the operation of the Company since 1750. Accordingly the two works supplement each other more than they clash in rivalry. The field which Dr. Bryce rightly claims for his own is the last eighty years, since the amalgamation of all the fur interests of British North America. With the disappearance of such trading bodies as the Northwest Fur Company of Montreal, the X Y Company, and the Astor Fur Company of New York, the history of the Hudson's Bay Company loses the excitement which comes from acute conflict, and tends to become the record of commercial routine. But the element of adventure can never be eliminated from life in that region, and Dr. Bryce has done well to emphasize the importance of a period which has hitherto been noticed only in connection with Lord Selkirk, the cession of Manitoba to the Dominion of Canada, and the Riel risings. A classified bibliography of literature relating to the Northwest is furnished, and signs of original research are apparent in every chapter. Putting the books of Mr. Willson and Dr. Bryce together, we are now in a position to follow the origin, progress, and practical working of the Hudson's Bay Company.

—The oblivion that has overtaken Volapük does not dishearten the apostles of linguistic unity. M. Léon Bollack of Paris regards the present as a moment favorable to the propagation of universal peace and brotherhood through the medium of a brand-new "international practical language" which he has invented. The little "English" pamphlet in which his views are set forth is almost pathetically funny. It consists, in the main, of an attempted translation of an article published last December by M. Raoul de la Grasserie, in which that respectable philologist speaks rather favorably of "The Blue Language," as M. Bollack has christened his novel idiom (another name for it is "Bolak"). There are also certain testimonies from men of letters, and, finally, an appeal to the world for support. We need not discuss the ingenious futility of M. Bollack's plan. What lends interest to his pronunciamiento is the extraordinary "English" in which he, or one of his helpers, has clothed his (and M. de la Grasserie's) ideas. It is not M. Bollack's purpose to create a substitute for existent languages. On the contrary, we learn that the "endeavor of the universal language tending to the end of supplying the place of all others, through who went to Scotland to help liberate the Scots; "having suffered persecution himself, he felt for" others likewise afflicted. There was also a Garibaldian colonel who had but one shirt—red. His benevolent landlady sought to wash it in the silent hours; but the maid returned from his room in dismay: "Lor, mum, he's asleepin' in it!"

Henry Hart Milman, D.D., Dean of St. Paul's: A Biographical Sketch by his son, Arthur Milman, M.A., LL.D. E. P. Dutton & Co. 1900.

The modesty which has kept back till now the biography of a man so distinguished in his day as Dean Milman, contrasts favorably with some examples of too hasty welcome of the dead to biographical honors; and the one volume into which the biography is compressed, suggests the shrinkage which many such works in two volumes or more would suffer could they be subjected to the weight of a few decades of impartial years. Yet, though Milman seems so far away, he was born (1791) only fourteen years before Martineau, who is but six months dead, and he was a literary contemporary of Carlyle. His early schooling was at Eton, and he went into residence at Brazenose, Oxford, in 1810, and there had a brilliant course, raking in prizes of all sorts in a quite unprecedented manner. One of the Ingoldsby legends has preserved a fragment of his fame:

> "His lines on Apollo
> Beat all the rest hollow,
> And gain'd him the Newdigate Prize";

and when Tennyson said, speaking of prize poems, they should not be regarded as poems, "not even Milman's," the general depreciation was less significant than the particular praise.

Milman shared with another Dean of St. Paul's the distinction of being a poet before he was a preacher, and in his case, as in Donne's, the distinction did not at first improve his chances of preferment. It is true that Milman's "Fazio" was very innocuous in comparison with some of Donne's poetical wild oats, but it was a play, and one that met with some success upon the boards, Fanny Kemble taking the principal part in it. Moreover, Ristori had it put into Italian with a view to assuming the rôle of *Bianca*. His next modest venture was 'Samor,' an epic in twelve books. This did not take the world by storm, but 'The Fall of Jerusalem' (1820) and 'The Martyr of Antioch' (1822) not only delighted the popular religious taste, but won the praise of good contemporary judges of poetry, securing for Milman the professorship of poetry at Oxford for five years. The fact that his lectures were delivered in Latin is one sign of many that the world does move.

He was a Quarterly Reviewer before Gifford's death, and thought kindly of that dread potentate, and was on the best of terms with Lockhart when that difficult person came in for the succession. But the great event of Milman's life was the publication of his 'History of the Jews.' It is difficult to imagine that his book was considered dangerous seventy years ago, so blameless is its innocence in comparison with Kuenen and Wellhausen, and their kind. When it appeared, it was denounced as "an impious book," "a gross misrepresentation of the Word of God," and there was a great tempest over it in the Anglican teapot. Milman was in truth one of the pioneers. His book was, as Dean Stanley said, "the first decisive inroad of German theology into England; the first palpable indication that the Bible could be studied like another book." Its worst offence was its attempt to relate Jewish history to a natural development, and especially that it called Abraham a "sheikh." A 'History of Early Christianity' followed and stirred up less wrath, though it carried over the method of the Jewish history to more dangerous ground. Out of his work on this book grew Milman's once famous, now somewhat discredited, edition of Gibbon's 'Decline and Fall.' It is amusing to find a friend suggesting to Milman that his Gibbon might be published by the Society for Promoting Christian Knowledge. "Nothing," wrote Milman, "but the most merciless castration will bring him within their notions of safety and propriety," and he did not propose to omit one word. Surely a Christianized Gibbon would be like Dr. Holmes's convivial song which was made over into a temperance ode.

A much better book than the 'Early Christianity,' and a truly noble one, was Milman's 'Latin Christianity,' which was published in 1854-55. It was warmly praised by Stanley and Froude and Dean Church; thousands of clergymen found it "as interesting as a novel"; its glowing style was no deduction from its more solid traits; and those who think it has been superseded make a great mistake. Dean Milman's relations to the Colenso and 'Essays and Reviews' controversies were very creditable, and breadth and liberality were at all times distinguishing features of his mind. The Tractarian excitement seems to have overpassed him like a summer cloud. His picture facing that of the title-page is not sicklied over with the pale ecclesiastical cast. It suggests the bluff and hearty captain of an East Indiaman. There is every reason to believe that he was a gentleman after the manner of the Chevalier Bayard.

A Treatise on Zoölogy. Edited by E. Ray Lankester. Part III. The Echinoderma, by F. A. Bather, assisted by J. W. Gregory and E. S. Goodrich. London: Adam & Charles Black; New York: Macmillan. 1900. 8vo, pp. viii, 344. With many illustrations.

This work, although entitled Part III., is the first publication of a series of volumes to comprise a comprehensive treatise on Zoölogy planned by Prof. E. Ray Lankester and under his editorship. The authors are, for the most part, graduates of the University of Oxford, though it is not contemplated to restrict future volumes of the series without exception by this limitation. Each of the larger groups of the Animal Kingdom is to be described by a separate author or group of experts, and, as far as practicable, the editor aims to preserve a certain uniformity of scope and method.

The general object of the treatise is to give a systematic exposition of the characters of the classes and orders of the animal kingdom, with a citation in due place of the families and chief genera included in the groups discussed. A main purpose of the editor has been that the work should be an independent and trustworthy taxonomic presentation of the main facts and conclusions of animal morphography, especially for the uses of serious students of zoology. The work as a whole will comprise ten demi-octavo volumes of about the size of the present one, which will be issued without reference to logical sequence, as soon as ready for the press. Besides the editor, among those who have consented to take part in the preparation of the series, Professors Poulton, Benham, Weldon, and Minchin, and Messrs. Bourne and Fowler, may be mentioned.

The present volume constitutes an independent manual of the important group of the Echinoderms, including the sea-lilies, sea-urchins, and starfishes, besides other less familiar groups. It is illustrated by more than three hundred figures, nearly all of which have been specially drawn for this publication, many of them from generic types in the collection of the British Museum. Bibliographical references to the more important papers in the literature, and a complete Index to generic names and technical terms, have been provided.

The endeavor has been made to combine with a comprehensive, systematic treatise the historical or evolutionary succession of life in the class more thoroughly than in any previous publication on these animals. The chapters on Echini, Starfish, and Ophiurans have been written by Dr. J. W. Gregory, formerly of the British Museum and now professor of geology at Melbourne; that on the Trepangs or Holothurians by Mr. E. S. Goodrich, demonstrator of anatomy in the University of Oxford; the others by Mr. F. A. Bather of the British Museum, who has acted as sub-editor under the supervision of Professor Lankester. For many years Mr. Bather has been recorder of the literature of Echinoderms for the *Zoölogical Record*, and in charge of the collection of these animals in the British Museum. His very intimate knowledge of the Crinoids and the opportunities above mentioned have given him an equipment for his present task such as no other zoölogist possesses.

Bather divides the Cystidea of the palæozoic age into four orders, from one of which, the Amphoridea, by five different lines of descent, the Echinoderma have probably been derived. From the Edrioasteroid line, we may suppose the Holothurians, starfish, and echini developed in the order named; while representatives of the original stock persisted to the close of the Carboniferous epoch. The Diploporite line ought properly to include the Blastoidea, and from it probably arose, as a fresh development with a new lease of life, the important class Crinoidea, of which representatives still exist. The other lines were less successful, and none of them survived the Silurian. According to Bather, there are not less than seventy families of Crinoids, and their classification has been a work of extreme difficulty, scheme after scheme having been tested and rejected. The classification of Wachsmuth and Springer, though by far the best from an anatomical standpoint, is not, according to our author, the phylogenetic classification sought by the modern biologist. He takes the character of the "cup," which has either one or two circles of plates, as fundamental; this distinction running back to Archæan obscurity.

It is inadvisable to attempt here any detailed discussion of so technical a subject; let it suffice to say that the work appears to be of the highest quality, and to have all the promise of proving a permanent addition to the small list of manuals which do not lose their value with the lapse of time. The illustrations are of a high order of excellence. The portions of the work due to Messrs. Gregory and Goodrich lack the distinction of that which we have just referred to, but give a good general discussion and illustration of the groups concerned, which will be appreciated by students.

The United States Naval Academy. By Park Benjamin of the Class of 1867. G. P. Putnam's Sons. 1900.

This work is mainly a history of the Academy at Annapolis, though the earlier pages are devoted to a description of the life and education of midshipmen before the Academy was called into existence and definitely established at Fort Severn at Annapolis, Md. It is to be regretted that the author has detracted so much from the dignity of his work by a flippant and affectedly quaint style for the sub-title and chapter headings. The book really is of importance and possesses substantial merit, and is by far the best extant upon its subject.

There seems no doubt that Mr. Benjamin has cherished a lively interest in his Alma Mater, as well as in the naval service from which he severed his connection many years since. His success in life in other pursuits has not weakened his affection for the scenes of his youth, and he has paid his tribute to the institution that shaped him in the present labor of love. Tracing the midshipman and his rôle from the first beginnings in the English navy, the author commences with our midshipmen at the creation of the navy in Revolutionary times, before which many of our colonial families were represented in the English navy, *e. g.*, the Brentons of Newport, R. I., one of whom became in later years a historian of the British navy. The midshipmen of the American navy during the Revolutionary war had the pay of twelve dollars a month, and were presented with a uniform of a blue coat and breeches and a fine red waistcoat. The men before the mast wore green shirts in those days. The way of the midshipman was hard, for it is recorded that John Paul Jones, when in command of the *Ariel*, not only found it necessary to "kick Mr. Fanning, midshipman, and order him below," but to "put Mr. Potter, midshipman, in irons for a thermometer being broken in his cabin." It was the only thermometer in the possession of the doughty commander, and the provocation was considered great. In the quasi-war with France that followed years afterwards, the estimation in which midshipmen were held was greatly increased, and Midshipman James Jarvis, as all patriotic boys well know, received the thanks of no less a body than the Congress of the United States for gloriously preferring certain death to the abandonment of his post on the *Constellation*.

President Jefferson desired to have the midshipmen of the navy educated at the Military Academy at West Point, and subsequently a bill was reported in the Senate which provided for the removal of the Military Academy from West Point to Washington, its reorganization, and the instruction therein of midshipmen. This measure was never passed by Congress, and midshipmen were taught by naval instructors afloat until the establishment of the school, in 1838, in the building erected for the Naval Asylum, now the Naval Home, at Philadelphia. This school was lax in discipline and systematic instruction, but fortunately included among its small staff of instructors the well-known mathematician Prof. Wm. Chauvenet, afterwards of Washington University, St. Louis, but whose name was more particularly linked with the establishment and progress of the Naval Academy at Annapolis. The foundation of the Naval Academy was due to the astuteness of Mr. George Bancroft, the historian, while Secretary of the Navy, in 1845. Without waiting longer for the action of Congress, having secured favorable recommendation from a board of officers of high rank, appointed as an Examining Board at Philadelphia for a naval school to be located at Annapolis, he proceeded, on the 7th of August, 1845, to direct Commodore Franklin Buchanan to assume charge of the school thus recommended to be established, and to prepare for the approval of the Navy Department a plan for its organization and administration. This was done without reference to Congress; the Secretary of War having transferred, with the approval of the President, the abandoned post at Fort Severn, near Annapolis, to the Navy Department as a site for the school.

Although the grounds and buildings at this antiquated post were little fitted for the proposed institution, still a permanent abiding place was secured and a future marked out, and the Superintendent (as Buchanan was termed), with an academic staff of seven instructors, began work on October 10, 1845. No systematic courses were provided for, and the length of stay and date of departure were both uncertain; but progress was made, and in August, 1846, Congress made its first recognition by an appropriation which continued annually, and in 1851 the course at the Academy was made a consecutive one of four years, and it was further provided that no one could have a warrant as midshipman who was not a graduate of the Naval Academy. The senior graduate of the class entering in 1851 is the younger Admiral Selfridge. Concerning this, the author says:

> "It required the span of Selfridge's active career, forty-seven years, to bring this about. The Mexican war was fought by naval officers educated wholly under the old system, and the only representatives of the naval school in active service were a few young midshipmen, like Simpson and others, who had been in attendance at Annapolis for a few months. The naval officers in responsible command during the civil war were all of them of the old navy. Not only the youngsters of the Naval Academy, but all the oldsters, were lieutenants when the war began, and none of them reached the grade of commander before it closed. The Spanish war was fought wholly by graduates of the Naval Academy who had gone through the regular course, and by a few survivors of those officers who had entered the regular navy from the volunteer service at the close of the civil war."

The civil war confronted the Academy with a novel situation. Not only was the Academy depleted by resignations of the midshipmen from the South, and the ordering into service at once of the upper classmen, but the geographical situation of its site south of Mason and Dixon's line brought it into the area of the earlier warfare of this great struggle. As a consequence, the Naval Academy was moved, so far as it could be, to Newport, R. I., on the 9th of May, 1861, and enjoyed the hospitality of the War Department, part of the time at Fort Adams, and part at Fort Wolcott on Goat Island, the site of the present naval torpedo station. To this afterwards was joined the occupancy of the Atlantic House, a large summer hotel opposite Touro Park, by the upper classes.

The four years at Newport were the eventful ones of the civil war, and, under the war impulse, the Academy rapidly filled up. The class entering in the autumn of 1861 numbered more than two hundred, all of whom were quartered on board of the old frigate *Constitution*, which was moored in the inner harbor of Newport, close to Goat Island. Notwithstanding the manifest difficulties of the position, and the temporary and improvised nature of the establishments, the discipline of the Academy was well maintained, though class and corps feeling naturally suffered. Classes were divided and subdivided, and portions hastened into the service; for in our navy, as in the army, there never seems to be on hand the small reserve to meet emergencies or to allow for systematic courses of training and education.

The war over, the long term of Commodore Blake, then a retired officer, came to an end, and with the unwise return to Annapolis came the progressive and energetic administration of Admiral Porter, who gathered about him the élite of the younger men who had distinguished themselves in the war. The author, who was a midshipman during part of this régime, is perhaps not unnaturally disposed to remark upon the transition as well as to exalt unduly the administration. Circumstances favored the changes, excellent as they were, and the times were such as naturally exist with respect to military services at the end of successful wars. The facts certainly were that Porter did leave the standards of scholarship higher and the military and general tone better than he found them, though he was far from founding a college or creating a university. The work of Craven, the brothers Rodgers, George and Raymond, and of Simpson was advanced and supplemented by the successful efforts and influence of Porter, Ramsay, Sampson, and Luce.

Of the last-named, Mr. Benjamin says:

> "It is difficult to convey to any one not of the navy an adequate appreciation of Rear-Admiral Luce's great service to the cause of naval education, unless adequate record is made of the admirable work of his later years in the establishment of the War College and of the naval-apprentice system, of both of which he was the originator. But Luce's 'Seamanship,' which was written for the midshipmen, and which appeared in 1862, has been the authoritative text-book of the navy on its subject ever since, and is so still. . . . Every youngster has grappled with it until its very words are crystallized into the brain-structure of the navy personnel."

Luce, though holding the position of Commandant of Midshipmen, never became Superintendent, but his name will always be linked with the history of the Academy.

The course of the administration at the Academy has not always run evenly; but no more successful and creditable régime has existed than that brought to a close in July, 1898, by Capt. Philip H. Cooper, as superintendent. The reconstruction of the buildings upon a comprehensive plan and with fine architectural effect should be accompanied by a reconstruction of the curriculum, in accordance with the demands of a modern naval service and of the newly reconstructed personnel of the official grades. It is to be hoped that an advanced entrance examination will compensate for the proposed shortened course from six to four years, and that a brick-and-mortar policy will not lower the attention to the personnel of the Academy, without which its *matériel* is nothing.

The Architectural Annual. Published under the auspices of the Architectural League of America, and edited by Albert Kelsey, President of the League, etc., etc., etc. Issue for 1900. Philadelphia. Pp. 292.

This book, in form a small folio, appears as the first publication of the Society named on its title-page, and is sold by subscription only. The motto, "Progress before Precedent," occurs on the cover and on the false title, and allusion is made to it at many points throughout the volume. It seems to be admitted that, in theory at least, the object of the A. L. A. is to encourage such a habit of thought, and to lead the so-called designers of the country in the paths of wholesome and natural design, away from the narrow semi-archæological view which too many of them have taken of their art, and that at all epochs since the French Revolution. The Annual contains papers especially devoted to the works of the more original and more independent architects, those less given to the mere copying of ancient work. There are also papers by other men who might be distinguished by similar epithets. And again, there are notices of men of absolutely the contrary habit of mind; and as much space is allowed to the non-original designs of the day as to those showing some slight ray of intelligence and independent thought. This is inevitable in the present condition of the art in the United States, unless it should be the resolve of the editor to make a book wholly on certain lines, urging this and ignoring that, pushing the argument vigorously on the right lines, and answering as vigorously the objections that are or may be made.

It is evident that nothing like this has been attempted in the book under consideration. The reprint of Mr. Brooks Adams's stirring but not very intelligent speech, delivered at the dinner of the Sculpture Society and Mural Painters in New York not long ago, bristles with patriotism and sonorous assertions that the country is a great country with great thoughts of its own, and that the architects ought to come up to the American standard of bigness and of energy. The address of President Van Brunt, of the American Institute of Architects, is the proper thing for a President to say at an annual meeting—something encouraging and cheerful; for he would be a poor president who should not, on such an occasion, keep up the spirits of the men who sit to listen. A very brief paper, entitled "The Modern Phase of Architecture," and written by almost the only one of the men in large practice who really has tried to design high iron buildings as if they were really high iron buildings—Mr. Louis H. Sullivan—occupies page 27; but it was a paper read in the absence of the writer, and consists of generalizations wholly. The Baltimore Conference on Municipal Art, which was held in December, 1899, is briefly noticed by Mr. George Kriehn. The recent international competition for the University of California receives much fuller notice, and a great number of plates are added which, in their form of greatly reduced half-tone prints, can hardly be thought to render adequately the drawings of this memorable struggle. They represent, however, the unsuccessful as well as the successful designs. There is an interesting paper on bridges as accessory to city embellishment, and the ten pictures selected for this serve their purpose well as illustrating the text. By way of illustration to different articles, a very great number of interesting pictures are included in the book. But as for the avowed purpose of the League, all that can be found bearing upon that important subject is the tone of the criticism here and there. Thus, for instance, the Dewey Arch, admitted to be admirable as a piece of associated sculpture, is overhauled vigorously as a mere copy of a Roman original.

THE PROSE OF EDWARD ROWLAND SILL
16mo, $1.25.

This book has been very cordially welcomed by lovers of good literature, who count it one of the best books of the season. The *American Ecclesiastical Review* says of it: "Essays on beautiful natural objects, on literature and on criticism, on music, psychology, ethics and education are here collected, together with a few on various aspects of life. They contain real thought expressed with rare judgment and taste, and are uncommonly suggestive and awakening. The introduction includes letters revealing a rarely beautiful character, but this makes itself evident in all the essays, which are sweet-tempered, even when distinguishing between good and bad. The volume is real literature, and will have enduring life as such."

every State. This is true of every year, and even when the only question at stake may be which of two men shall occupy the Governor's chair. In a Presidential year, however, it is essential that the whole country shall have confidence that the result will be honestly reached and declared in a State which may prove the pivotal one. Nothing contributed so much to the quiet acceptance of the result in 1884 as the general conviction that New York had a fair election law. Kentucky ought to have such a law before next fall's election.

Gen. Wood's speech at Matanzas on Thursday implies that there has been a modification of the purpose of our Government to retain its hold upon Cuba in the indirect way of controlling the foreign relations and the finances of the island, but it is still a matter of doubt whether there has been any change. The recent proclamation issued by the General was for a convention "to frame and adopt a Constitution for the people of Cuba, and as part thereof to provide for and agree with the Government of the United States upon the relations to exist between that Government and the Government of Cuba." There could be no doubt of our intention, scarcely veiled under these words, to grant to the Cuban people only a part of the independence promised to them in the joint resolution of Congress which preceded the war with Spain. That resolution declared that

> "The United States hereby disclaims any disposition or intention to exercise sovereignty, jurisdiction, or control over said island, except for the pacification thereof, and asserts its determination, when that is accomplished, to leave the government and control of the island to its people."

According to the published report of Gen. Wood's speech, there was no specific withdrawal of the requirement that the coming Convention should make the relations of Cuba with the United States a part of the Constitution, yet the general tenor of his remarks points to complete independence as soon as a "stable" government is formed. The proclamation, by the way, requires the Convention not only to frame, but to "adopt" a Constitution. This word would seem to preclude the idea of submitting the Constitution to a vote of the people after it has been framed by the Convention, especially as no mention of such submission is made in any other part of the proclamation.

The protesting delegation of Cubans, headed by Señor Cisneros, called on President McKinley on Saturday, and laid before him their objections to the scheme of semi-independence which the proclamation mapped out for them. According to an interview with Señor Cisneros, published in the New York *Times*, gentleman does not look for any change in the terms under which the Convention is to act. He says that for his own part he would walk out of a convention where he was not free to act upon the whole subject-matter of the Constitution. He believes also that the people of Cuba will not be satisfied with a Constitution framed under duress, and he adds that "time only can tell whether a revolution against the Americans will be necessary, should the present policy be continued." He looks for the happiest relations between the Government of Cuba and that of the United States if the former is left, after the adoption of its Constitution, a free agent in the negotiations, but only on those terms. If there is to be coercion beforehand, he expects only strife and bitterness as a result.

The leading article of the *Diario de Porto Rico* of July 30 bears the heading, "Why We Abstained from Joining in the Celebration," that is, of the anniversary of the union with the United States (July 25). It draws a contrast between the conditions prevailing under Spanish and under American rule, which cannot be considered flattering to us. In the first place, it says that Porto Rico enjoys less of civil liberty now than it had under Spanish rule. Civil liberty means not merely freedom of action under the laws, but participation in all the affairs of government. It means equality in making the laws as well as equality under them. What are the facts? The *Diario* says that formerly Porto Ricans elected three Senators and sixteen Representatives to the Congress of Spain, whereas now they have one delegate in Washington without a vote. As to the Executive Department, it continues: "We had a council of secretaries, whose resolutions were *always* sanctioned by the Governor. Now we have an executive council, chiefly composed of persons who were not born here and enjoy no standing whatever in the island, and will naturally interest themselves more for the country appointing them than for the region which pays their salaries." Still more surprising, perhaps, is the fact that formerly the island always had a surplus revenue, although it was taxed for army and navy expenses and for "pensions to the descendants of Christopher Columbus," whereas now it is facing a deficit amounting to one million dollars. The *Diario* has a long list of disabilities suffered by Porto Rico now that were not known under Spanish rule, ending with the degrading one that the inhabitants are not citizens of the United States or of any other sovereign power. They are not under the protection of the Constitution. They do not form any part of the nation to which they belong. "We have been granted nothing of what we were promised," it says, "and our condition is that of a slave adscript to a conquered soil."

Hawaii is undergoing the process of transformation from a quasi-republic to a Territory of the United States, and the first step is the development of political parties. Already the white population is sharply divided into Republicans and Democrats, with their appropriate Central Committees and organizations. Such a division in a new Territory with its purely local interests can, it would appear, be based only on personal habit and prejudice, but its very existence testifies to the invincible vitality of the party idea. "Votes" of greater or less respectability are beginning to trouble the quietude of the managers. There is an ominous possibility of a third party in the native or Kanaka movement. But, as the Honolulu correspondent of the Philadelphia *Press* remarks, the Kanakas are dying off pretty rapidly, while from the lack of effective leadership this largest of all the Hawaiian "votes" is likely to drift towards the great organizations and lose itself in one or the other. There is also a Chinese vote of some five hundred, which is regarded as safe for the Republican party.

The governmental situation in Hawaii offers some features of novel interest. The first Territorial Legislature must face new and pressing problems. Foremost among these is the question of local self-government. Whether under king, queen, or president, Hawaii has been ruled by a strong central government. Even Honolulu and Hilo, towns of 30,000 and 15,000 inhabitants, respectively, have been invariably so governed. Under the change of administration there is already a clamor for the recognition of local rights and powers as we have them in America, and the new Legislature will have its hands full in dealing with applications for city charters. This problem of changing from a centralized to a decentralized form of government is seriously complicated by the number of races to be dealt with, and the absence of a local administrative tradition. The raising of revenue will prove a problem of no less difficulty. Through annexation to the United States, Hawaii loses the customs receipts, until recently an abundant source of revenue. The present tax rate is only 1 per cent., but any proposition for increase of the rate will meet with strong opposition. Gov. Dole advocates the floating of a temporary loan, a policy which appears to leave the main fiscal problem untouched.

It really looks as though a practicable system had been devised for keeping unfit immigrants from getting into the United States by being smuggled through Canada. The principal railroad and steamship companies of the Dominion have agreed to coöperate with the United States authorities in enforcng an inspection at the Canadian port of arrival

THE PATHFINDER.

The Republican organs cannot keep their minds off Mr. Bryan's speech; and we, too, recur to it, to whom it gave no uneasiness though we foresaw its withering effect on the third-party movement. Political progress, no more than human progress in general, moves in straight lines, and the reformer's ends are often, perhaps oftenest, reached by ways and instrumentalities not comprehended in his programme. The Anti-Imperialist has scored a triumph already in dictating a Presidential acceptance exclusively upon his own ground. The candidate may be insincere, may be simply cunning, but he has mastered the grammar of reform, and his exposition of genuine American principles—call them Hoar's, call them Boutwell's, or Schurz's, or Chapman's—has not only surpassed his models, but has perforce obtained universal consideration. Seldom indeed is it that a Presidential candidate furnishes the best campaign document in his own behalf, and takes the lead in the higher education of the citizen voter of all parties. Mr. Bryan has opened school with a lesson in fundamental republican morality, and prefaced the exercises with appropriate readings from the Republican scriptures. One has but to compare this with the wildfire of 'Coin's Financial School' four years ago, to perceive how great an advance has been made in the Democratic canvass in reason if not in principle.

No one can deny that we owe this advance to Mr. Bryan's initiative, to the same will-power that imposed the folly of 16 to 1 on the Kansas City Convention—but let him alone to know on which plank to trust his full weight. This elephantine sense, however, is not uncommon. Other candidates, Cleveland included, have been obliged to shut their eyes on the shameful parts of a platform which they nominally accepted as sound in its entirety, and to select those which they could defend on the stump and promise to maintain if elected. Mr. Bryan's distinction consists, not merely in selection, but in a specific pledge of maintenance which he, and he alone, can carry into effect. The Democratic party in convention on July 4 committed themselves to this attitude respecting our Eastern possessions:

> "We condemn and denounce the Philippine policy of the present Administration. . . . We favor an immediate declaration of the nation's purpose to give the Filipinos, first, a stable form of government; second, independence; and, third, protection from outside interference, such as has been given for nearly a century to the republics of Central and South America."

This is clear and unequivocal, but it is weak in merely "favoring," and it makes no promise of consistent party action. In other words, in this particular, *the platform resembles platforms in general—they are supposed to be self-executing, like curses and imprecations.* The authors of them are anonymous, the personnel of our huge conventions is incognizable and unrememberable, there is no party executive committee responsible for the drafting and introduction of the measures demanded. Hence the hollowness and emptiness of these declarations, and the contempt into which they have fallen. In the present case, the framers of the Kansas City platform could not refer to antecedent party conduct conformable to the resolution just quoted. It was one of the disingenuous features of Bryan's speech that he omitted all notice of Democratic joint responsibility for Congressional abdication in the matter of a colonial policy. There was no coherent opposition to the Administration on this subject, no shibboleth, no test. The drifting which suited the President and the Jingoes was tolerated by Democrats and Republicans alike, and McKinley found plenty of positive support in both houses from his natural opponents. There was no reason to suppose that the Kansas City plank had in it any compelling power for Senator Morgan, for example, or for the rank and file.

Mr. Bryan has changed all that. He declares that, if elected, he will prove his sincerity in treating Imperialism as the paramount issue by summoning Congress in special session. Congress must assemble. It may again abdicate its function: Democratic members may refuse to obey their chief; Republican anti-imperial partisans like Senator Hoar may refuse to coöperate with a Democratic Executive. Nevertheless, the issue will have been made up in sight of all the people, and Mr. Bryan, if thwarted, will still retain all the powers as Commander-in-Chief which McKinley has exercised from the moment he made war on Aguinaldo. More than that, he will have set an imperishable example to all succeeding candidates for the Presidency who wish to advertise themselves as men, and not plastic doughfaces under party or Congressional pressure. Nor would the example be less honorable for not being altogether the first of its kind. Seven years ago this month Mr. Cleveland convened Congress in extra session to repeal the Sherman Silver-Coinage Act, and succeeded, if by dint of some sorry bargaining. Mr. Bryan's originality lies in staking his election on a similar procedure, and at the very beginning of the Presidential conflict.

Should the battle rage more and more about the issue defined by Mr. Bryan at Indianapolis, to the exclusion of all other issues, real or factitious, Senator Hoar himself could hardly fail to applaud the strength of a leader who marshalled his forces to victory in behalf of the right of mankind to self-government. It would be the Cleveland miracle over again as regards persons; and as regards the party, it would demonstrate anew the fact that while the Republican party has not shown since 1876 the power of self-regeneration, the Democratic—with all its base residuum, with all its Tammany thieves and ruffians masquerading as a political organization—has that power in reserve. It might also appear that Mr. Bryan's demagogic capacity, joined to his persuasive rhetoric, would serve him in winning the people to his side in dealing with a refractory Congress—an art for which Mr. Cleveland was slenderly equipped. Be this as it may. For the moment it is our duty to praise an act of courage and of high innovation, attended by admirable words which, had they been uttered *in vacuo*—that is, by a man quite unknown, or unsuspected of duplicity—would everywhere have been recognized as heralding a renaissance of public virtue and loyalty to national ideals.

GENERAL APATHY.

The politicians may disagree on other topics, but on one subject they appear to be harmonious; they all deplore the apathy which prevails among the voters. The Republicans say that there is no doubt of McKinley's election if the Republican voters will take some interest in it. Unfortunately, there appears to be no means available for arousing their interest. Every one knew months, if not years, before the Convention that McKinley was to be renominated, and the same was true of Bryan's nomination. The interest at Philadelphia was confined to the unexpected episode of the nomination of Mr. Roosevelt for Vice-President; and at Kansas City there was a similar excitement over Mr. David B. Hill. But the popularity of Rooseveltism has waned almost as much as that of McKinleyism; and Bryanism has become tiresome, even to Bryanites. The Democratic politicians find nearly as much trouble with apathy as the Republicans, although they do not talk so much about it. They are tired of Bryan themselves; and the public has at least had abundant opportunity to satiate its curiosity about him during the last four years.

Emerson said that in order to understand any crime, he had only to look into his own heart; and the explanation of general apathy may be found by every individual who feels apathetic. The general comfort which now prevails is itself favorable to general apathy in politics. There is no large class suffering from poverty, as was the case in 1896. The farmers have been faring well, and are not troubled by their mortgages; the laboring classes are getting steady work and good wages. The masses of the community are really too busy at present to give much time to politics. The clergy always complain of the lack of spiritual fervor in times of prosperity; and the same influences affect political life. In 1896 half the people were embittered père, even the amateur performances of Jules de Goncourt. I have never seen anywhere such a representative showing of the wood-engravings of the first half of the century. There are prints from almost all the illustrated books that had a great vogue from (putting it roughly) 1830 to 1850 or 1860, and are now sought after by the collector. The illustrators are chiefly the same men who made those endless numbers of lithographs—Lami, Monnier, the Johannots, the Devérias, Gigoux, also Jacque, Meissonier, and, indeed, too many for anything like a complete list to be given here. The engravers were the men who developed wood-engraving in France, most of them having learned their craft from Bewick or his pupils—Best, Leloir, Andrew, Brévière, Laveille. The great book of those days, the prize of the modern collector, is the 'Contes Rêmois,' with illustrations by Meissonier, engraved by Lavoignat, and, fortunately, a set of proofs has been lent by M. Lepère, who, with Baude and Léveillé, bring the history of wood-engraving well down to 1889.

But, long before this, photography had been the cause of a radical change in the conditions of illustration. It had given the illustrator a freedom never hitherto enjoyed. He, more than all other artists, had been restrained by technical limitations, far more so than the painter, who is held within bounds by his frame, or the sculptor, whose imagination is chained to his bit of marble. The illustrator, provided he was the master of his craft, could now make his drawing as large as he chose, and in whatever manner best pleased him, and it was photographed on to a block of the required proportions for the wood-engraver, or of metal for the photo-engraver. There is no question that this freedom was a new incentive to the art. Many artists who had hitherto always held aloof were induced to illustrate, while the illustrator of experience was able to experiment and strike out fresh paths for himself. As many new departures followed in black-and-white as in painting. The illustrator, too, led revolts and inaugurated improvements. Then came what the enthusiasts called the revival of book decoration, and in a wilderness of mannerisms and affectations was found occasional evidence of originality, occasional expression of very distinct personality. Increased activity among illustrators gave a corresponding stimulus to the art, or science, of reproduction. New and more ingenious methods were evolved, until the developments and changes of the last twenty years are almost beyond belief. But of this activity, of this growth, this never-ceasing increase in the popularity of the art, what recognition is there in the Grand Palais des Beaux-Arts? Practically none. In section after section, French and foreign, drawings and prints alike are hidden in dark corners or banished to blazing balconies. Where the painter may cover a few feet with his one canvas, the illustrator is allowed but a few inches for his drawing. Ambitious painters, nowadays, work on a colossal scale simply because they fear that, if they do not, they must be overlooked in an exhibition. What chance is there, then, for the illustrator to attract attention, when, anyway, for his work to be fairly represented, he should show not one, but as many drawings as were made to illustrate a certain article or book? And this custom of reserving for black-and-white the worst and most insignificant places would convince many people, who really care more for it than any other form of art, of its comparative insignificance. It seems almost as if the painters were jealous of the illustrator's greater success and popularity.

In the French Section, where there is more space, matters are not quite so bad, and yet bad enough. The one long gallery is not large enough, and the result is the unpleasant overcrowding that comes from a series of alcoves on either side and screens running down the centre. Little fault need be found with the collection of etchings, lithographs, and wood-engravings. No new etcher, within the last decade, has arisen to take the place of Félix Buhot, but there are the prints of Louis Legrand, Renouard, Lepère, Lunois, and all the men now at work, with the unexpected exception of Helleu, of whom I could find no trace; and also the clever and amusing color experiments of Raffaëlli, Jeanniot, and too many more to name. All the lithographers whose designs have been adding to the gayety of nations in *L'Estampe Originale*, and in the two Salons year after year—Dillon, Lunois, Carrière, Chéret—are here in endless array. And the wood-engravings and woodcuts, original, reproductive, and in color, by Lepère, Baude, Léveillé, Henri Rivière, are no less conspicuous. The original drawings of the most distinguished or popular French illustrators are, however, not so easy to discover. In vain I searched the catalogue and the gallery for the most prominent of all, Forain, Caran d'Ache, Steinlen, though they do appear in the French Section of Publishing and Printing, a mile away. Nor is it only that many are missing. Others, like Boutet-de-Monvel, have unaccountably refrained from sending their finest work; or, like Louis Legrand, Renouard, Vogel, are so scattered, here, there, and everywhere, that an estimate of contemporary illustration in France, as a whole, is out of the question.

If there is any country in which modern illustration is generally supposed to have made the most striking advance, it is America. But the foreigner must wonder why this should be when he reaches the American Section. One short stretch of wall on the balcony, and a screen in the forgotten room below, are considered sufficient for the representation of the arts of drawing, etching, lithography, wood-engraving, and architecture in the United States. Even the miniatures share the already too restricted space. I admit these are unusually good examples of the art to-day, when, in England, a miniature is little more than a touched-up photograph on ivory. It is long since I have seen work as delicate and charming as Mrs. Fuller's, and as personal, in a way, though there may be no mistaking the source of her inspiration. But the merit of the miniatures is no excuse for their encroaching upon the absurdly limited space nominally devoted to black-and-white. Of the quality of the prints and drawings there can be no complaint; it is a question, altogether, of quantity. In etching, Mr. Whistler has a number of his masterly prints, the greatest surely since Rembrandt's, and Mr. Pennell, a series of aquatints, and that is all. In lithography, one print by Mr. Whistler exhausts, as far as can be seen, the efforts of lithographers in America. In wood-engraving, there are examples of Mr. Cole, Mr. Wolf, Mr. Davidson, Mr. Kingsley, Mr. Johnson, and, according to the catalogue, Mr. Kruell, whose prints, however, to my regret, did not appear upon the walls. But the original drawings are few, and these few are hung to anything but advantage. Mr. Pyle's one design, in oils, is lost among the paintings, though why it should be there might be hard to explain. Blum and Remington are absent, while Abbey, Pennell, Frost, Gibson, Clark, MacCarter have either been allowed to send such a small number of drawings, or are placed so badly, that their work does not tell as it should. This is the more provoking because other countries, with less to show, have, by building in their portions of the balcony, gained in hanging space, and, therefore, have been able to make more of a display.

In the British section, one is struck principally with the omissions. All the things one, in reason, expected to find, have been left out. In England, if anywhere, originated the modern so-called revival of book-decoration. But though the Kelmscott Chaucer has been thought worthy of a case of honor in the publishers' section, not one of Burne-Jones's designs for it is here. Ricketts and Shannon, disciples of Morris, have nothing. Anning Bell has nothing. The Birmingham School have nothing, for Mr. Gaskins's drawings, decorating the walls of a bedroom in the English pavilion, hardly seem to form part of a black-and-white exhibition. Walter Crane is the one representative of the decorative group. Again, Phil May is now the leading English comic draughtsman, and deservedly so, but he, too, has nothing. Sambourne and Raven-Hill are the living artists who, with Du Maurier and Keene, uphold the traditions of *Punch*. Of the younger men, Greiffenhagen, Hartrick, and Sullivan have nothing; Nicholson alone is admitted, and that rather grudgingly, for his color prints are well above the line. To all appearances, England is without lithographers, though Shannon's lithographs have a world-wide reputation. And, if a half-dozen of the best-known etchers are included—Haden, Short, Watson, Hall, Cameron, Holroyd—where, one cannot but ask, are William Strang and Edgar Wilson?

It is the same story in the German and Austrian sections. A few odd drawings, lithographs, and etchings lie in portfolios or are hung where it is almost impossible to see them, in the German balcony. But Menzel, the greatest illustrator of all, is not an exhibitor, and you must go to the German pavilion for Sattler—or so I believe; he is carefully protected in a locked apartment to which I was not admitted—and also the younger men, Unger, Fischer, and the group who work for *Jugend*, and whose gay and daring designs are made by Hirth, the Munich publisher, the feature of his exhibit. For Austrian illustrations, also, you must leave the Grand Palais and wander to the Rue des Nations, and then, even in the Austrian pavilion, there is but one illustrator, Mucha, seldom worthy of his fame at home, but, fortunately, in this series, illustrating the "Our Father" so much better than usual that it would be doubly interesting could he but appear side by side with the illustrators of the world.

The other sections make a still scantier showing. It is the distinction of Switzerland to boast one of the most distinguished and individual draughtsmen and one of the most distinguished and individual wood-engravers jugation, conquest, or territorial partition. "The United States," said Secretary Hay, "is opposed to the partition of China." Our object was the reëstablishment of the *status quo*, and not the erection of a new or dismembered China on the ruins of the old one.

This declaration of policy, at once frank, dignified, and palpably unselfish, unquestionably did more than anything else to clear the air and bring the Powers to agreement as to the military steps to be taken. A second declaration four weeks later, called out by Li Hung Chang's suggestion that the Ministers be sent under escort to Tientsin, was no less explicit, and, as things have turned out, equally effective. The United States, it was declared, could enter into no negotiations so long as free and unrestricted communication with the American Minister at Pekin was denied. As an indispensable prerequisite to negotiations, the attacks upon the legations must cease, communication must be restored, and order must be secured; and until these conditions, demanded not as favors, but of right, were fully met, military operations would continue. It was at once evident, of course, that this plain statement virtually threw down the gauntlet to China, and made possible any number of startling moves. China might treat the reply as equivalent to an ultimatum, and itself declare war. It might murder the foreigners. It might sow dissension among the allies, and, perhaps, land the United States in isolation and defeat. Nothing can be clearer now, however, than that Secretary Hay's announcement was exactly what the Chinese Government needed to bring it to its senses and induce it to stay its hand, and that the opposition to the advance of the international army was weakened, from that time on, by the certain knowledge that the allies were not to be seduced by fair words or intimidated by covert threats.

The success which has crowned American diplomacy in this matter is so far a matter of national achievement that no personal or party feeling ought to color the recognition of it. Out of a tangled and dangerous situation, full of pitfalls and snares, into which the United States was plunged with scarcely a word of warning, this country emerges with dignity and great honor. For the time being, no doubt, the treatment of the Chinese difficulty has appreciably enhanced the prestige of the Administration. The greater difficulties, to be sure, are still before us. What may follow the occupation of Pekin, no one can tell. Undoubtedly, the question of the partition of China will yet be very seriously discussed, but the troubles of the Administration with our possessions in the Philippines seem not likely to tempt President McKinley or his advisers to seek more territory in that part of the world. o long as the United States maintains a body of troops in China, however, it has itself marked out its own course of action, and has the satisfaction of knowing that its course has had, up to the present time, the assent and coöperation of the Powers. It is earnestly to be hoped that nothing may occur to change our present policy, or turn us from the path which thus far has led to such conspicuous and gratifying success.

THE PARIS EXPOSITION.—VII.

THE BLACK-AND-WHITE.

LONDON, July, 1900.

The disappointment of the exhibitions is the black-and-white. It is true there is much of genuine interest, but it is found chiefly in the Centennial Collections, while the good work in the Decennial Sections is so scattered that it fails to produce any effect whatever. Curiously, illustration, the art of all others whose complete development belongs to the nineteenth century, is always the least well represented on these occasions. In 1889, at Paris, a few illustrators were brought before the whole world for the first time—Vierge, Charles Keene, Abbey. In 1893, at Chicago, thanks chiefly to the publishers of the large magazines, some idea was given of the excellence and distinction of American illustration. But, even at Chicago, black-and-white had not a section apart; it was overshadowed, as it ever has been, by painting, and the only hope was that the Exhibition of 1900 would, at last, do it the justice and insure it the prominence it deserves.

Paris has failed to fulfil this expectation, and you begin to understand why when you examine the constitution of the various Committees of Selection. On the American Committee, there were at least two artists who made their reputation as illustrators, but, too often, the work of selection seems to have been left to men who have no practical interest in illustration, and, what is worse, make no pretence of having any. It may be the fault of their indifference, it may be the result of some traditional system of classification in France, but it is discouraging at the outset to find drawing classed with painting, wood-engraving in another division with etching and lithography, and modern methods of reproduction omitted altogether. There is no attempt to group the arts of book-illustration together, or to have them judged separately by a jury of experts. Only here and there, in the Publishers' Department, is there any adequate suggestion of the work that is being done at the present time in black-and-white. As for an adequate representation, you might think it was out of the question until illustration, as a vital, living form of art, shall belong to the past. For the inconsistent part of it is, once an art does belong to the past, its value is appreciated; once an artist is dead, no matter in what medium he worked, he becomes a classic, to be treated with all honor. The retrospective or Centennial Collection of French drawings and prints is complete and delightful, and would be a most valuable introduction to the art of illustration as practised to-day, were the existence of that art only as much as recognized. The history of the century is one of continual growth, and the methods of the earlier decades, to be understood, should be considered in relation to the more modern work. The last hundred years have seen the invention of wood-engraving and lithography, the change from copper to steel in metal-engraving for the illustration of books, an entire revolution in reproduction by photography—in a word, they have seen the almost phenomenal popularization of illustration. It is one long story of change and development.

In the early part of the century, when there was no photography, if the artist worked for the metal-engraver, he made his design in an elaborate form, it was copied on the plate, and the original was spared. It was the same when he worked for the reproductive lithographer. If he made the lithograph himself, his prints were but the multiplication of his drawing. On the other hand, if he drew for the wood-engraver, it was on the block, and his work disappeared in the engraving; but the engravers of that period were themselves artists. These different methods are admirably recorded in a fine series of drawings and prints.

It begins with the classical, rather pompous and ponderous designs of David, Gros, Guérin, Girodet, Gérard, really studies for their pictures, and not illustrations at all. Then came the vigorous sketches, so many protests of independence, by Géricault, Delacroix—his caricatures will be a surprise to most people—Decamps (all these as striking as their paintings in the galleries down stairs), and a marvellous, probably unrivalled collection by Ingres, portraits in pencil, so beautiful, so refined, so learned, so perfect in draughtsmanship, they make one wish he had never used a brush, and attempted to draw in the color that meant so little to him. Still more numerous are the notes and sketches and more carefully finished designs by the men whose profession was illustration—Monnier, Grandville, Lami, Devéria, Gavarni, Daumier—the greater number in pen-and-ink strengthened by flat washes of color, the effective early method that might better be revived than the primitive naïvetés the modern artist prefers to borrow from a more remote past. There are also the designs of another group of painters who either illustrated very occasionally, or not at all—Paul Huet, Corot, and the Barbizonians, Legros; among them, it is amusing to find Victor Hugo in two romantic compositions, as magnificently exaggerated as his descriptions in 'Notre Dame,' but impressive in their extravagant fashion.

The series of lithographs, naturally, is not as exhaustive as in the great show of lithography in 1895, but it covers the ground fairly well. It opens with the inevitable "Cossack" by Baron Lejeune, and some of the initial experiments by Girodet, Denon, Horace Vernet. It includes the most famous of the few masterpieces by Géricault, Delacroix, Isabey, and many of the most distinguished and, in their day, notorious prints by the artists who won for lithography its astonishing popularity—Charlet, Grandville, Monnier, Lami, Devéria, Gavarni, Raffet, Gigoux, Daumier. It ends only with the performances of Manet, Hervier, Fantin, and the little group who revived lithography as an art, when it had lost its supremacy as a method of popular illustration.

But it is impossible to describe in detail a collection that would require an entire article to itself; and this is as true of the etchings, which are mainly reproductive, with here and there the original designs of Méryon, Lalanne, Bracquemond, Millet, Leened with great danger. And in particular they should distinctly take the ground that Paris is a place where the joy of student life, as the healthy young American understands it, cannot be had.

In saying this, one need not commit himself to any judgment as to the precise statistics of vice in one country or another. What is certain is that nowhere else is it so open and blatant and all-pervading as in Paris. To show that I do not exaggerate, that to ignore this matter in the face of what everybody knows is a piece of pure silliness, I append a passage from a letter on Paris taken from a yesterday's daily newspaper; it is written (the article is signed) by a good observer and a man of honest speech, who is merely engaged in giving his readers a clear impression of what Paris is like. Let those wise and good men who are urging on a movement to deflect young men from the German universities and to send them to the Paris schools, consider carefully within themselves if they are doing well:

> "It is to get sensations, to study the psychology of pleasure, to know what is meant by 'la vie de Bohême,' that all the world goes to Paris. It is to her we take our materialism, our appetite for good dinners, our love of the footlights, our extravagance, all the catalogue of our vices, and she does her best to satisfy our expectations. Above all, she creates about her an atmosphere which makes the puritanical person feel a strangely easy conscience. She has known many who came to pray remain to scoff at the sad-faced moralities. The metamorphoses that take place in her visitors might be set down as one of the sights of Paris."

C. L. F.

NEW YORK, August 11, 1900.

ON TRANSLATING THE CIVIL LAW.

TO THE EDITOR OF THE NATION:

SIR: I have read with interest the review of Mr. Walton's 'Civil Law of Spain and Mexico' which appeared in your columns of the 2d of August. With that part of the review which deals with the introduction I am not concerned; but as a student of the Roman, and a practitioner of the civil law as it prevails in Louisiana, I am much concerned at some of the criticism indulged upon the method pursued in rendering the Spanish code. This criticism appears to me not only unjust to the translator, but pregnant with sanction of a most dangerous method of dealing with the civil law. We are now in extensive contact with that system, and it would appear to behoove us to bring into it as little change as possible unless we have a better substitute to offer. Have we? Your reviewer appears to assume that we have. He even ventures to offer substitutes of his own for certain technical terms, many so consecrated by the usage and tradition of centuries as to have attained to an almost mysterious precision. Speaking of Mr. Walton's translation, it is said:

> "It does not fail for lack of pains, but for lack of skill. Unless the reader knows Spanish, he will find much of it wholly unmeaning because the translator prefers to render Spanish words into their nearest phonetic equivalent in English, where an apt selection, a circumlocution, or the retention of an idiom incapable of exact translation would make the sense clear. For instance," etc.

The foregoing contains a wholly unwarranted assumption, viz., that much of Mr. *Walton's translation is meaningless to any reader who happens to be ignorant of Spanish, solely because of such ignorance.* But it is not ignorance of the Spanish language that makes the translation meaningless, but of the Roman law. I am safe in saying that no Louisiana lawyer of education would fail to grasp instantly the precise import of the Spanish terms, or to assert the entire propriety of Mr. Walton's English equivalents. To do the first, he would be in no need of Spanish. He would see that the Spanish words come directly from the Corpus Juris, and that in form they have but slightly suffered from the law of consonantal change, and in substance not at all. If the propriety of the English equivalents was questioned, he would point out, for example, that the word *faculdades* is but the *facultates* (*facultas*) so common in Roman jurisprudence; that the French Code Civil and its commentators frequently use the word *faculté*, and that the Code of Louisiana follows them both in the adjective *facultative*.

In the term *donationes inter vivos* he would recognize leading titles of the Institutes of Justinian, the Code of France, the Code of Louisiana, and of innumerable commentaries on all three. If the word *gift* was tendered him as a substitute, he would at once point out that that word in English imports only a gratuitous disposition of property; while the technical word *donation* is generic in the civil law, and comprises dispositions which are both gratuitous and non-gratuitous. For example, he might refer to article 1,523 of the Civil Code of Louisiana, which defines three kinds of donations *inter vivos*, viz., gratuitous, remunerative, and onerous. He would see as little reason for abandoning the term donation "having an onerous cause," and adopting in lieu thereof "gift for valuable consideration." He would recall the same long and exact tradition which fortifies his use of the word "faculty," and he would assert, with as much joy as is permitted to a lawyer, that a valuable consideration is not, and never was, necessary to support a civil-law contract; and that he is glad to have forgotten the five differing historical theories of the doctrine, taught at Harvard and elsewhere. If the abandonment of the term "institution of heir" were demanded of him, and the adoption, instead, of the term "bestowal or creation of heirship," his shudder would be uncontrollable. If to the injury of this demand is added the insult of the query, What sense do the words "institution of heir" convey? he would hold himself entitled to wrath. For of all the ancient and sacred formulas of the Roman law, there is none so ancient and sacred as that contained in the words *Instituo heredem*—the *caput testamenti* says Justinian—the words of nomination, without which every solemn testament must fail. The figure of the *heres institutus*, the instituted heir, gladdened the eyes of an expectant bar ages before Bracton borrowed wholesale from Rome the materials for the first crude legal treatise known to his half-savage island; and to-day he walks the soil of Louisiana and all the countries of Europe under his inherited name. Surely it would be a hardship to compel so large a part of the world to speak of his nomination as a "bestowal or creation of heirship" and of him as a "bestowed" or "created heir." Napoleon's commission gave him his due when it headed the third section of the third book of the Civil Code with the words "Institution d'Héritier," and Mr. Livingston, called by Sir Henry Maine the first legal genius of the age, robbed him not in the Code of Louisiana (Arts. 1,495-1,499.)

The crowning injury would be wrought by bidding any Civilian to speak of "heirs defined or limited by statute, *i. e.*, disposition to certain blood relations if living, somewhat analogous to the New York restriction on charitable bequests by a man of family," instead of "forced heirs," when he wished to designate a person entitled to the birthright portion. He would recall at once the *sui et necessarii heredes*—the necessary heirs of the Roman law; and neither the *herederos forzosos* of the Spanish, nor the *forced heirs* of the Code of Louisiana, would in the least perplex him. Indeed, no severer criticism of the method Mr. Walton is blamed for not pursuing can be found than that which lies on the surface of the examples given of translations that might have been made by him. Thus the abandonment of the single word *forced* drives the reviewer to a periphrasis of thirty words, and one that wholly fails to convey the fundamental legal conception. Surely the price demanded is heavy and not to be slightly paid.

The point I wish to make in this connection is one made long ago by Sir Henry Maine in a paper published in the Cambridge Essays for 1856, entitled, "Roman Law and Legal Education." He contrasted the precision and rigorous consistency of terminology which pervades the Roman law and its derived systems, with the looseness of terminology of the English law. He first adverts to the poverty of our legal vocabulary. Of this the slender contributions of English law to the language of English speculation is adduced as proof; and against these slender contributions is set over the immense debt owed to the Roman lawyers by the language of European speculation in all branches. One of the prime causes assigned for the looseness of our legal vocabulary is the attempt so often made to eke out its deficiencies by an ignorant borrowing from the vast storehouse of the Roman law. The material thus introduced, in the hands of lawyers and judges profoundly ignorant of its weight of exquisite accuracy, has become positively baneful, when, in the hands of a less insular bar and bench, it might have been the means of redeeming our jurisprudence from the formless shape we all know it to be in.

It has been my lot from time to time to see the courts of Louisiana put, in the rightful places of Paul and Papinian, the jurists annually announced by the publishing houses of Boston, Minneapolis, and Chicago; and the result has been neither beneficent nor harmonious. If I have deprecated with over-much fervor a review which appears to sanction a like preference as a matter of course, the great names under whose shadow we practise our profession in Louisiana, and our jealousy not only for the continued, but for the further, recognition of their bearers as the rightful sovereigns of the domain of jurisprudence, will, I am sure, secure me indulgence.—Respectfully,

CHAS. P. COCKE.

NEW ORLEANS, August 8, 1900.

[Mr. Cocke is, of course, influenced by local sanction, nearly a century old, for the usage of English words in a Latin sense that conveys no meaning to a stranger. Granting that certain terms of the civil law are untranslatable, is it not better to retain them in the Spanish or Latin, rather than render them in an English that (save through accepted usage) is at once uncouth and meaningless? This alternative we ourselves suggested. We admire Mr. Cocke's veneration for the law he lives under, and hope that something of his spirit will animate the revisers about to lay their hands on the civil law in Porto Rico. Were the bar in the common-law States affected by a like sentiment, we should have much less slovenly law-making.—ED. NATION.]

Notes.

Herbert S. Stone & Co. will publish during the autumn 'The Life of Edward FitzGerald,' by John Glyde; 'The Love of an Uncrowned Queen [Sophie Dorothea, Consort of George I.],' by W. H. Wilkins, M.A.; 'Famous Trials of the Century,' by J. B. Atlay, M.A.; 'Chapters from Illinois History,' by Edward G. Mason; 'Wooings and Weddings in Many Lands,' by Louise Jordan Miln; 'Between the Andes and the Ocean,' a South American journey southward, by William Eleroy Curtis; 'More Fables,' by George Ade, author of 'Fables in Slang'; and 'The Fortune of a Day,' by Grace Ellery Channing-Stetson.

Mr. Fisher Unwin's autumn announcements include 'The Unpublished and Uncollected Poems of William Cowper,' edited by Thomas Wright; 'Critical Studies,' personal and abstract, by Ouida; 'The Speaker's Chair,' by Edward Lummis; 'The Jew in London,' by C. Russell and H. S. Lewis; 'A Review of Irish History in relation to the Social Development of Ireland,' by John P. Gannon; 'A History of the Isle of Man,' by A. W. Moore, Speaker of the House of Keys; 'The Canadian Contingent,' Canada's work in the cause of the Empire, by W. Sanford Evans; 'Among the Berbers of Algeria,' by Anthony Wilkin; 'In the Ice-World of Himalaya,' by Fanny Bullock Workman and William Hunter Workman; 'The Paris Salon of 1900,' 100 choice examples; and 'In Birdland with Field-Glass and Camera,' by Oliver G. Pike.

The Lothrop Publishing Co., Boston, have in press for immediate issue 'China's Open Door,' by Rounsevelle Wildman, United States Consul-General at Hong Kong.

Truslove, Hanson & Comba have nearly ready the seventh edition—virtually a new product—of 'The Temperance Problem and Social Problem,' by Joseph Rowntree and Arthur Sherwell.

Volumes xvi. and xvii. in the Scribners' uniform edition of Mr. Frank R. Stockton's novels and stories are also numbered ii. and iii. of the (short) "Stories." The latter has a very good portrait of the author, who, in "My Terminal Moraine," turned an honest penny out of the site of his actual New Jersey home, if not exactly in the way his humor represents when figuring the discovery of a glacier ice mine.

In the fourth volume of their series of "The World's Orators," under the editorship of Dr. Guy Carleton Lee, assisted by Dr. Joseph Cullen Ayer, Messrs. G. P. Putnam's Sons have gathered sermons by seventeen preachers of the long period between Wycliff and Massillon. Recognizing the limitations imposed on them in most instances by translation, by the brevity of the excerpts, and by an evident desire to avoid selections polemic in tone, it may be said that the editors have had decided success in presenting characteristic examples of the oratory of men illustrative of as various tendencies as Savonarola, Luther, Calvin, Knox, Latimer, Bossuet, Fénelon, and Vieyra. The prominence given to the great French preachers of the age of Louis XIV. is doubtless deserved by their oratorical eminence, and adds materially to the interest of the compilation; but it is not surprising that the editors feel constrained to say that the sub-title of the volume, "Orators of the Reformation Era," is to be "construed in its broadest meaning," and to explain the inclusion of the eminent Frenchmen as "justified by the arrangement of the remainder of the series." The presswork and portraits are admirably executed.

Among the latest publications issued by Cornell University (Macmillan) are an 'Index to the Memorabilia of Xenophon,' the joint work of Catharine Mary Gloth and Mary Frances Kellogg, and 'A Study of the Greek Pæan,' by Arthur Fairbanks, Ph.D. The latter we shall consider hereafter. The Index is one of those patient labors of pure scholarship which can hardly receive due acknowledgment; it owes its existence partly to the encouragement and the example of Dr. Forman. We have only one suggestion to make. Under ἄν, μή, ὅπως, and similar words, much valuable information is conveyed by simply grouping the references under certain heads. Perhaps we might plead for a slight extension of this method, which would note under certain verbs the construction or the cases by which they are followed. This would hardly add to the bulk of the volume, nor to the toil of compiling, while it would greatly assist the student of style and usage.

The special field of the John Crerar Library of Chicago was determined by agreement with the Public Library and the Newberry Library, as well as by the restrictions of the founder. It is defined as "that of the natural, the physical, and the social sciences, with their applications." The Library has a complete catalogue printed on cards, copies of which are to be found in the libraries just named, as well as at other institutions even as remote as the University of Champaign, Ill. The contents of its reading-room, which is used by the public without formality, have just been set forth in a list bearing date of January, 1900, a handsome large octavo volume, very open in its typography, and remarkable for the use of electrotype titles. Noticeable, also, is the class arrangement, which is logical and not alphabetical by author or subject; things which belong together being grouped. An index chiefly of authors, but also of collective titles, anonymous, and some other, is the clue to individual works. The List is put forward tentatively for criticism as to fulness. As the compilers point out, its utility is by no means confined to the patrons of the Crerar Library.

One of the most valuable publications issued on the occasion of the semi-millennium of Gutenberg is Catalogue No. 24 of the house of Jacques Rosenthal of Munich, called 'Incunabula Typographica,' containing a description of 1,500 incunabula in the possession of this enterprising firm, covering the period from the invention of the art of printing to the year 1500 A.D. Although it is an elegantly printed octavo volume, with three colored plates and 80 illustrations in the text, the price is only 3 marks. The book will delight the heart and eye of the bibliophile and the student of literature. The collection represents the product of 400 printing establishments at fully 90 different localities; the city of Mainz, with the productions of Gutenberg, Fust, and Schoeffer, being in the lead. The chief publications of the German, Italian, French, and Dutch concerns of the period are all represented here, together with a number of the rare and costly "block books." There is an index of 32 pages.

China is the principal subject of the *National Geographic Magazine* (Washington) for August, the first article being an attempt to show the two main causes of the present situation. A civilization which is founded upon the right of a man to his life and his property, and upon the inviolability of a contract or promise, has come into intimate relations with a civilization which denies that these are rights. The other and possibly as significant a cause is the "sacred right of rebellion," distinctly taught by Confucius when a ruler "ceases to be a minister of God for good." The corruption and incompetency of their present rulers are known to every intelligent Chinaman, and it is probable that the Boxer rising, with its watchword of "China for the Chinese," was originally directed as much against the Mantchu dynasty as against foreigners. The difficulty of invasion and conquest is shown by a brief description of the physical features of the empire, and it is maintained that the hatred of foreigners is confined to the ruling classes, and is not shared by the people at large. Commander H. Webster, U.S.N., gives an interesting account of some of the manners and customs of the Chinese. Observations of their methods of doing things led him to the conviction that nearly all of these are the "results of long experience, a survival of the fittest in pretty nearly every branch of human needs and conveniences." Referring to the fact that even the lowest classes can read and write, he says "that their education comes largely through the steady and persistent use of the stray minutes of life. As soon as a piece of work is done, while waiting for a fresh job, or even standing in line, waiting his turn to deposit his package, bale, or cask, the coolie plays with a stick or bit of bamboo, writing a character over and over, or studies a few characters written on a bit of paper brought from a pocket." Prof. Simon Newcomb contributes some notes on the shadow bands observed during the late eclipse, and there is a brief sketch of the hydrographic work of the United States Geological Survey.

Mr. E. S. Grogan, in a communication to the London *Times*, says that the success of his journey from the Cape to Cairo was in part due to the fact that the Nile was lower than it had been for 150 years. "The consequent drying up of much of the marshland south of the Sobat junction alone rendered my overland route from Bohr to the Sobat possible." He estimates this region through which the river flows to be at least 10,000 square miles in extent, the most of it being covered by dense growths of juicy vegetation. The loss of water resulting from this is shown by the fact that the Nile, after receiving the enormous volumes brought down by its great western tributary, the Bahr el-Ghazal, is but little larger than it is when it leaves Lake Albert, five hundred miles nearer its source. Referring to the various plans for reclamation, as by planting willows and poplars, he says, "It is the utter impossibility of imagining, even from description, the magnitude of these swamps and the impenetrability of the vegetable barriers that makes these schemes appear feasible." The sudd formation he ascribes chiefly to a plant growing in the Victoria Nile with a head like a small cabbage and a tangle of root which descends to a depth of twelve to eighteen inches. "These plants become detached singly or in blocks from the main mass, by hippopotami, crocodiles, fish, or some other disturbing influence," and drift until stopped by some snag, lily, or shallow. Refuse of all sorts accumulates about them; "then comes the papyrus and dense reeds, and what was originally a stick or a water-lily has in a few months become a solid island on which the hippopotami can walk." From observations of the effect of the native fish weirs on this floating vegetation, he believes that piles driven into the river here and there would deepen the channel and prevent the accumulation of sudd barriers.

The excavations conducted by Dr. Bliss for the Palestine Exploration Fund continue to yield meagre and unsatisfactory results, to the great disappointment of archæologists and Bible scholars. In view of the astonishing wealth of inscriptions, constructions, statuary, pottery, etc., found by explorers, not only in Egypt and Babylonia, but also in Syria, Asia Minor, Crete, Greece, and, in fact, in almost every ancient country where the spade has been used in latter years, it was confidently expected that excavations in Palestine would yield important returns. Up to the present such has not been the case. We trust, however, that the Palestine Exploration Fund will persist in its search. Very few sites have yet been touched, and those, for the most part, not the most promising. It will bear repeating that a "School for Oriental Study and Research" is to be started in Jerusalem this October, on the same general plan as the archæological schools at Athens and Rome, which have done so much to increase our knowledge of Greek and Roman antiquities and literature, and to improve the instruction in Greek and Latin in our schools and colleges. The first director of this school, it is announced, will be Prof. C. C. Torrey of Yale. The chairman of the committee having the management of the school in charge is Prof J. H. Thayer of Harvard. More than twenty colleges, divinity schools, and universities in this country have become members by the subscription of $100, and the American Institute of Archæology has granted the new school a subvention of $500. This renders it possible to commence the work on a very modest scale. There is pressing need of further funds to establish the school on a secure basis, and equip it adequately for the important task it has undertaken.

Dr. Erich Adickes of Kiel, a young scholar already favorably known through his writings on Kant, contributes to the *Rundschau for August* a fascinating study of human nature under the title, *"Die Halben und die Ganzen: zwei Menschheitstypen."* The latter designation he used for those self-centred characters whose intellectual and moral strength renders them independent of the outward support of immutable beliefs and institutions; to whom all things without, all authorities and principles, are of relative worth only. The former name denotes those far more common characters who need a multitude of conditions, opinions, ideals, authorities to lean upon, to appeal to as a last and absolute resort. The contrast between these two types of the "relativists" and "absolutists," to be sure, rarely appears with perfect distinctness; neither does the writer deal with individual examples. He traces the two *tendencies* in all human relations—in social and married life, in national (patriotic) and political affairs, in science, art, philosophy, religion—and shows, not without originality, their influence in each of them.

The German National Association of Engineers have decided to publish on a grand scale a 'Technisches Woerterbuch,' and have invited the coöperation of specialists abroad. Promises to this effect have been requested from leading savants in France, England, and America.

The French authorities are seriously agitating the project of a restoration of the Papal Palace at Avignon, one of the most characteristic specimens of mediæval architecture. For about a century it has been used by the Government as a barracks, as a result of which the structure is in a deplorable condition. Many of its wonderful frescoes have been erased or covered with whitewash. The walls of the magnificent conclave hall are covered with crude sketches and inscriptions. The two papal chapels have been divided into several stories. The chapel of St. John, containing exceptionally fine mural paintings, is sadly in need of restoration. The frescoes, regarded as the work of Spinello (Aretino), which picture the Last Judgment and the Crucifixion, are practically lost to art. In 1859, Napoleon III. promised that the Government would give four million francs for this work of restoration, but the project failed. Since 1870, the citizens of Avignon have been memorializing the Government for this purpose; but the state and the city cannot agree as to the payment of two million francs which the new barracks would cost. It is estimated that the restoration of the building would cost about seven million. The Minister of War has decided upon an inquiry with a view to a settlement.

From the annual report of the Secretary for Mines and Water Supply of Victoria, it appears that the annual output of gold in that colony during 1899 was 854,500 ounces, and that the total production of Victoria up to the close of that year amounted to 63,539,205 ounces, valued at £254,156,820. Thus, of the 110,413,597 ounces, valued at £427,194,079, which the Australasian colonies have yielded from the first discovery to the close of last year, 60 per cent. has been produced by Victoria.

Many people seem unable to understand what an extensive business the forging of Shakspere documents, portraits, and signatures was in the early part of the last century. Forged Shakspere portraits and forged Shakspere signatures, therefore, continue to turn up from time to time with a distressing regularity. It is to be hoped that Zincke's well-known forgery, the Talma bellows portrait, which is on the market again and offered in a recent bookseller's catalogue at eighty-five guineas, will not find a lodgment in Chicago beside some of the recent alleged Shakspere signatures which have gone thither, or that, if it does tempt the Chicago millionaire, he will get an expert to look up its interesting history.

—In the double July quarterly issue of the Oxford English Dictionary (Henry Frowde) volume iv. runs abreast with volume v., Mr. Henry Bradley carrying on the torch from Gradely to Greement, and Dr. Murray from Inferable to Inpushing. Greek derivatives are rare in this tract of the letter G, but the ending -graph finds a place, and we are told that Telegraphist is more common in England than Telegrapher. Under -gram there is a hint of future editorial preference for Program over Programme. Telegram, though formed contrary to Greek analogy, proved too convenient to be disallowed. Proposed in 1852, its record date in literature is 1857. Many hybrids, like Cablegram, have been fashioned after it. The obsolete Gramm—'what is written,' 'a phrase'—cited solely from Nathaniel Ward's 'Simple Cobbler of Agawam' (1647), is an Americanism which was worth taking root, but it fell by the wayside, and perhaps the Ipswich author of the Massachusetts Body of Liberties was its only sower. Walter Savage Landor had no better luck with his Grandor—for Grandeur, as if to help Clio to a neat rhyme for his own name. Emerson fathers Grandiose in 1843; Mrs. Browning Grandpaternal in 1844, and Byron Grand-dad in 1819. The oldest forms in English for this human relationship are Grandame and Grandsire, which go back to the twelfth century, while Grandfather and Grandmother emerge only in the late fifteenth. Grandevity has been superseded by Longevity. Mr. Bradley's leading rubric is Great, which fills eighteen columns. Very interesting is the evolution of Grammar, which at first and until the seventeenth century connoted only Latin, and a Grammar-school a Latin school. The intransitive verb Graduate, by the way, to which some purists object, was used by Southey in 1808. The French adopted their verb *graver* from the Teutonic, then formed *engraver;* and this, taken over into English as Engrave, has all but driven out Grave.

—Dr. Murray finds *his* interesting suffix in -ing, which is peculiar to English in its gerundial use, though this was unknown to Old English and Middle English. "The gerund," we read, "still retains one feature of the verbal substantive, viz., that of admitting of a preceding possessive case or possessive pronoun, as in 'after John's behaving so strangely,' 'upon my readily granting it.' In the literary language this construction is regularly retained with a pronoun, and very generally with a single personal substantive; but, with names of things, and phraseological or involved denominations, the sign of the possessive began to be dropped already by 1600; . . . and, in current spoken English, the *'s* is commonly omitted with all nouns," as by Thackeray in 'Vanity Fair,' "I insist upon Miss Sharp appearing"—"where," adds Dr. Murray, " 'Miss Sharp's' would now sound pedantic or archaic." With the passing remark that this would not, in our opinion, so sound to an American ear, we note a disregarded function of the novelist in bringing to light colloquialisms which are carefully excluded from the cultivated style in almost all other branches of literary production. In this, novel-writers play the part of earthworms in dragging the subsoil to the surface. Scott was a very industrious earthworm with archaisms, which he sometimes misapplied, as when he used Ingle, 'a boy-favorite' (in bad sense), for 'chum.' So Bulwer-Lytton, in 1841, and Hall Caine half a century later, dependently or independently, converted Ingle, 'a fire on the hearth,' into 'an open fireplace.' Such an extension of meaning, however mistaken, is, of course, common enough. On a later page we find Inherit meaning 'to make heir' from 1304 to 1593 (Shakspere),yet in 1400 starts up the opposite meaning 'to receive as heir,' and in the end prevails. Thus, given time enough, Ingle may be extinguished by its own fireplace. Another instance is afforded by Inhabitable, which meant 'uninhabitable' from 1400 to 1742, whereas the upstart sense of 'inhabitable' reared its head in 1601, and the prefix *in-* finally went over altogether from the negative to the locative. Curious is the fate of Inhumane, which began with the sense of 'inhuman,' of which it presently adopted the form and stress. Later, Inhumane arose anew, but with a milder signification. The poets are the natural recorders of this transformation. Dr. Murray warns us off from Innuendo minus the second *n*. Of the cleft or split infinitive he has nothing to say objurgatively or otherwise, contenting himself with referring by way of the *Nation* to Dr. F. Hall's discussion of the usage in the *American Journal of Philology*, and with citing from the *Academy* an undated example from Byron, "To slowly trace." The intransitive use of the word Inform, in the sense of 'to report,' is marked obsolete. We have met with it in Quaker minutes of the latter part of the last century in New Jersey (Hardwick and Mendham Meeting), *e. g.*, 1797: "Women friends informed that Hannah Housel . . . has gone out in marriage with a man not a member of our Society, by the assistance of an hireling priest"; and have found it still in vogue in the same denomination in Pennsylvania within the present generation.

—We have before us two volumes of a new historical series, edited by Mr. Oliphant Smeaton, which is entitled "The World's Epoch-Makers" (Scribners). A publisher's announcement states that the desire is to "give a bird's-eye view of the origin and progress of the most prominent movements that have taken place in theology, philosophy, and the history of intellectual development from Buddha to the present day." This definition is extremely elastic, and the set should prove a long one. The two volumes of which we now notice the appearance are 'Luther and the German Reformation,' by Dr. Thomas M. Lindsay, and 'Cranmer and the Reformation in England,' by Mr. Arthur D. Innes. The latter book comes first in order of publication, but we shall observe the order which is dictated by relative importance of subject. Dr. Lindsay frankly approaches Luther with the intention of treating his career in a new way. "Although Luther's life has been written scores of times, it has always seemed to me that there is room for another—for one which shall be careful to set Luther in the environment of the common social life of his time. . . . To show what that life was, and to show Luther in it, would, it seems to me, bring him nearer us than has yet been done." Accordingly, he gives us much less of dogmatic theology than might be expected, and much more of the popular culture which existed in Germany at the close of the Middle Ages. In short, the book follows Janssen's method more nearly than that of the ordinary evangelical treatise which used to be written for English readers a generation ago. We welcome this change both as furnishing a new means of approach to an oft-discussed topic, and as better adapted to the tone of the series, which is comparative in scope. According to Dr. Lindsay's plan, a large part of the space is devoted to the different orders of society, peasants, burgesses, knights, and nobles, to the national character of the Lutheran revolt, to the effect of Luther's marriage on popular opinion concerning sacerdotal celibacy, to the superstitions which were prevalent in the sixteenth century, to Luther's educational views, and to the reformer's home life. He shows at all points familiarity with Luther's own works, whether theological or popular, and has formed his judgment at first hand, after examining the opinions of friend and foe from Cochlæus and Seckendorf to Döllinger and Köstlin. While the learning displayed in the volume is sound and the thought mature, we have noticed a number of small errors in statements of fact, in the spelling of proper names, and in the use of accents. Some of these may be fairly called misprints, and altogether they do not constitute a serious blemish. Dr. Lindsay sympathizes with Luther so strongly that he lays slight stress on his well-known faults of temper. He concludes with a passage from Döllinger: "Even those Germans who abhor him most as the powerful heretic and the seducer of the nation cannot escape; they must discourse with his words, they must think with his thoughts." A good chronological summary and a carefully selected bibliography are added to the text of the volume.

—Mr. Innes's volume on Cranmer is considerably shorter than Dr. Lindsay's 'Luther,' from which it also differs in style and purpose. It shows a greater feeling for picturesqueness, and it is closely confined to the subject of religious politics. Mr. Innes likens the English Reformation to the Revolution of 1688. No one questions the importance of either, and yet neither can display a hero. Here the real subject is the movement, not the man, despite the title of the series. "The purpose of this volume is not so much to present a biography of Cranmer as to give a sketch of the ecclesiastical period through which he remains a consistently prominent figure; a period during which he, more than any other single individual, left his personal impress upon a national institution." The three great points in any life of Cranmer which aims at exceeding the compass of a personal biography are, first, the archbishop's policy towards Church and State in the reigns of Henry VIII., Edward VI., and Mary; secondly, the lasting seal which he impressed upon the Church of England; and thirdly, the conflicting views of his public character which have been formed by Romanists, Anglicans of the High Church party, and Evangelicals of all classes. Mr. Innes keeps each of these matters before him in his accurate and thoughtful essay. One of the most striking opinions which he advances is that Cranmer, in deserting warm friends like Anne Boleyn and Thomas Cromwell, was not acting from fear nor "from the political preference for expediency over right." The reason, Mr. Innes urges, why he acknowledged their guilt is, that he did not trust his own judgment when it came into conflict with Henry's, simply because he had come to place implicit reliance upon the King. This explanation of meanness—it is hardly an extenuation—on the ground of intellectual subjection is more novel than satisfactory, but it at least shows an acute sense of the relation which existed between sovereign and primate. Both in England and Sweden the breach with Rome represents the power of the crown rather than any religious initiative on the part of the national church or of the people. Mr. Innes is a writer of terse and clever phrases; his distinctions, too, are often subtle and suggestive, for instance, his definition (in the preface) of the terms Romanist, Protestant, Puritan, and Catholic. As an illustration of his style and also of his attitude toward the English Reformation, we quote the concluding sentence of his summing-up: "The reconciliation of Catholicism and Puritanism could never be more than partial. The peculiar achievement of Cranmer lay in his framing a *modus vivendi* so effectively inclusive in its scope that Laud could rule the same Church whose children in later generations were brought up on the 'Pilgrim's Progress'; that Church which a few years since included among her sons Lord Shaftesbury, Dr. Pusey, and Dean Stanley." Why to these last did not Mr. Innes add the name of Benjamin Jowett?

—Nearly ten years ago, Dr. Hermann L. Strack, Professor of Theology in the University of Berlin, published a pamphlet entitled 'Der Blutaberglaube,' in which he discussed the use of human blood for sacrificial and superstitious purposes, and the magical and medicinal qualities popularly ascribed to it. The pamphlet created considerable sensation and passed rapidly through seventeen editions. This success was due chiefly to the fact that the author refuted the accusation so frequently brought against the Jews, that they commit so-called ritual murders in order to obtain Christian blood to mix with their unleavened bread at the feast of the Passover. For this reason he was bitterly attacked by the Catholic press, and the controversy which ensued contributed largely to the sale of the brochure and the consequent enlightenment of the public mind. The persistency of this absurd notion for nearly seven centuries (at least since 1236) is most remarkable. The same charge was brought against the early Christians, who were said to use human blood in their religious rites because they were wont to speak of the sacrament as partaking of the body and blood of the Lord. Even a scholar so distinguished as Prof. G. F. Daumer, in his work 'Geheimnisse des Christlichen Alterthums' (Hamburg, 1847), describes human sacrifices, anthropophagy, and drinking human blood as characteristic features of the Christian religion from its origin to the end of the Middle Ages. Nearly every year at Easter intense excitement is produced somewhere in Europe by the report of ritual murders perpetrated by Jews. In 1899 a girl, Agnes Hruza, at Polna in Bohemia, and recently a student named Winter at Konitz in West Prussia, were supposed to have been victims of this sort of religious fanaticism, but the allegation in both cases proved to be false. In one instance, at Boleslaw on the Vistula, a woman drowned her child in a swamp and stated that the Jews had slain it for their Paschal feast. The body was soon afterwards found, and she confessed that the accusation had been made at the instigation of the parish priest. Professor Strack has now revised, enlarged, and republished his pamphlet under the title 'Das Blut im Glauben und Aberglauben der Menschheit' (Munich: Beck), in which he discusses the whole subject in a masterly manner. The latter half of the volume is devoted to a careful examination and complete refutation of the opinion so maliciously fostered by Anti-Semitic agitators, that the Jews use Christian blood in certain religious rites. The author gives the sources of his information on every point, and thus enables the reader to control the statements made and to form an independent judgment.

BYRON'S WORKS.

The Works of Lord Byron; A new, revised, and enlarged edition. Poetry. Vol. III. Edited by Ernest Hartley Coleridge.—Letters and Journals. Vol. III. Edited by Rowland E. Prothero. London: Murray; New York: Scribners.

"I do believe," wrote Byron to the Mr. John Murray of ninety years ago—"I do believe that the Devil never created or perverted such a fiend as the fool of a printer. . . . There is an ingenuity about his blunders peculiar to himself. . . . There is one mistake he made, which, if it had stood, I would most certainly have broken his neck." What would Byron say to the Mr. John Murray of to-day if he could see some of the typographical eccentricities in the volume before us? At the end of a famous paragraph in "The Giaour," instead of the familiar

> "Yes! Self-abasement paved the way
> To villain-bonds and despot sway,"

we are brought to a gasping halt by a senseless and asthmatic ejaculatory "yet":

> "Yet! Self-abasement paved the way."

Again, when the dying Giaour apostrophizes his lost Leila,

> "Earth holds no other like to thee,"

Mr. Murray's printer has made him cry out:

> "Each holds no other like to thee,"

which is a veritable puzzle in pronouns, especially in the context in which it stands. Atrocious as these blunders are, they pale into insignificance before what stares at one from the very centre of page 288:

> "Up rose keen Conrad from his silent trance,
> A long, long absent gladness in his glance;
> ''Tis mine—my *blood-rag* flag! again—again—
> I am not all deserted on the main!' "

For this translation of *blood-red* Byron would doubtless have broken the printer's neck in good earnest, nor would it be easy for the mildest-mannered man to rate the punishment as excessive.

What vengeance would have satisfied him for the trick that we have next to mention, we prefer not to conjecture. In the eleventh stanza of the second canto of "Lara," on page 358 of this definitive edition, occurs the following peculiar couplet:

> "The stubborn wall that mocks the leaguer's art,
> And palls the patience of his *baffled art.*"

The right reading, of course, is "baffled *heart.*" Printers and proof-readers have a right to drop their *h*'s, no doubt, for that is "largely a personal matter"; but they should at least have indicated the omission in the usual manner. "Baffled *'eart*" might not look pretty in an English classic, but it would at all events be intelligible, and would not pervert the poet's meaning.

Misprints are small deer, and under ordinary circumstances the less said about them the better. They may fittingly be gathered in at the end of a book-notice or smuggled into an obscure foot-note. But here the circumstances are far from ordinary. We are dealing with a notable literary undertaking. Mr. Murray's Byron is meant to be a definitive edition, and it has many claims to that title. In particular, it is advertised as exhibiting "a new text, collated with the original MSS." Now the typographical prodigies to which we have referred are not in the editorial apparatus: they are in the text of the poems! Such slips as "Chants Populaires des *Servics*" for "Serviens" (p. 188), "Timal[eon]" for "Timol[eon]" (p. 311), "claves" for "slaves" (p. 297), "The American *Magazine of History*" for "The Magazine of American History" (p. 298), "Opera" for "Sallusti Opera" (p. 117), are annoying because they give the impression of slovenly editing and make one uneasy about weightier matters, but they are of no importance in themselves, and no critic would think of dwelling on them. But "blood-rag flag" in Conrad's outburst in "The Corsair," and the inexpressibly comic "Yet!" in the splendid Grecian passage in "The Giaour,'" fall in quite another category. They suggest the "Vinegar Bible" and such-like historical triumphs of mechanical perversity. And that is not the worst of it. They throw suspicion on the accuracy of that portion of the critical apparatus which, being based on manuscripts in the publisher's possession, cannot be controlled by the reader. For our own part, we must confess that we turned with some trepidation to the ferocious couplet in "A Sketch":

> "And make a Pandemonium where she dwells,
> And reign the Hecate of domestic hells,"

uncertain whether we should not find "hecat" instead of "Hecate," according to the immortal anecdote.

In reviewing the earlier volumes of Mr. Murray's Byron, we have spoken of the enterprise in highly commendatory terms. If we dwell rather on the shortcomings of volume iii. than on its merits, there is good reason for such procedure. The good points are obvious to the most cursory eye, and are, indeed, precisely what they profess to be. The volume, like its predecessors, is fully and intelligently annotated, and, founded as it is on the archives of the house of Murray, it at once and inevitably supersedes all other editions. In a word, it makes good, in many respects, its implicit claim to definitiveness. This being true, the editor was bound to quite unusual and exemplary care in all the details of his delicate task. His work should, of course, be accurate, but it should be more than merely accurate: it should be artistically perfect, so far as perfection is attainable. And this quality of artistic finish—which is as recognizable in a foot-note as in a sonnet—should pervade all the pedantic minutiæ inseparable from conscientious editing. Now the trouble with Mr. Coleridge lies precisely here. He is a good editor in the main. He has taste and scholarship; he takes his task seriously and is not impatient of drudging toil. Yet he seems to be constitutionally incapable of putting the last hand to his work—of giving it that final revision which tells for so much in the sum, though it can be observed and studied only in trifles almost too insignificant to specify. In the volume before us, this laxity of editorial fibre is perhaps more manifest than in those that precede. At all events, the inexcusable misprints to which attention has been called suggest uncommon carelessness somewhere. There are important volumes to come, and our hope is that either Mr. Coleridge himself, or, preferably, some candid friend, may be induced to give the proof-sheets that last half-hour's "going-over" which is always so fertile in disagreeable surprises. It is in this hope that we subject the present volume to a somewhat narrow scrutiny.

Volume iii. contains, besides the "Hebrew Melodies" and a number of miscellaneous poems, the six tales of 1812-15—"The Giaour," "The Bride of Abydos," "The Corsair," "Lara," "The Siege of Corinth," and "Parisina"—and closes with what the editor calls "Poems of the Separation." It covers, therefore, an extraordinarily interesting period of Byron's poetical career, and its contents, from whatever point of view they are judged, comprise some of the most significant verse of the century. Byron's greatest work, as Mr. Coleridge well remarks, "was yet to come; but the work which made his name, which is stamped with his sign-manual, and which has come to be regarded as distinctively and typically Byronic, preceded maturity and achievement." It is the fashion to belittle this work, to decry it as footlight trickery and tinsel, to raise the eyebrow at its instant and unparalleled popularity. In the critical jargon of the day it is called "insincere" and "unconvincing," and foreigners are pitied for still admiring it. "Poor things, they know no better!" At least one of the denunciators has read it all, for he is a genuine *helluo librorum*, but it may well be questioned if the rank and file of repetitious criticules have done anything of the sort. At all events, just as the thorough-going Byronian—and a few of these are left—cannot help shuddering at some of the lapses of which their author is guilty, often in the least opportune contexts, so the most superior apostle of convincingness could not read "The Giaour" or "The Corsair" at a dash, as they were written, without feeling their real, if intermittent, power. But it is too late—or rather too early—to debate the Byronic question. We must leave it "to the next age," which is lying in wait for so many of the critical *aperçus* of our generation, and pass on to the simpler problem of Byron's editor.

Bibliography is not Mr. Coleridge's strong point, yet in editing these 'Tales' he has had to grapple with bibliography of the most perplexing kind. In former volumes, as we have had occasion to remark, he has embroiled matters a good deal. In vol. iii. he has done better. Yet there are instances enough of vacillation and inconsistency to make the reader uneasy. His account of the editions of "The Giaour," for example, though far more complete than any previous record, is not quite intelligible after all. There were twelve editions in 1813-14. The question of their relations is not a mere subject of pedantic curiosity. "The Giaour" grew from 407 lines in the first draft to 1,334 lines in the seventh edition, and the history of this accretive process is interesting from several points of view besides that of the professional potterer with texts. Mr. Coleridge's well-conceived table (pp. 79-80) is a great help, and we try to be duly grateful. But we should feel more comfortable if his computations would only balance! As it is, he tells us that a mysterious first edition (extant in proof only) of twenty-eight pages contains 460 lines. His table foots up 453 lines for this same edition. Again, he informs us (p. 79) that a seventh edition "was issued subsequently to November 27, 1813," adding that it "was advertised in the *Morning Chronicle*, December 22, 1813." Later (p. 217) we are told, without any qualification, that this edition "was published on the 29th of November, 1813." The matter is of slight consequence except as a symptom. Other symptoms of like nature are not lacking. In the introduction to "The Bride of Abydos," apparently from forgetfulness, there is no discussion of the different editions—not even a statement that the poem was issued at all after its first appearance. Yet in the introduction to "The Corsair" we have a casual reference to the sixth edition of "The Bride" as published on a particular date. This is not all. The MSS. of "The Bride" are discussed with what appears to be the nicest care on pp. 151-2; yet at the end of the text (pp. 211-12) there is an additional note, and a comparison of this with the prefatory treatment reveals inconsistencies in matters of fact. Apparently the later note is meant to rectify the earlier. We have had an instance of the same kind of editorial afterthought in a previous volume. The result is confusion. We can only hope that all these tangled threads will be unravelled in the promised general bibliography, which is to be prepared by an expert, and to which each succeeding volume makes one look forward with more and more trembling hope.

To return to "The Giaour." It is surely not too much to expect of such an edition that it shall try to settle for good and all the moot point—Who is the teller of the tale? But Mr. Coleridge does nothing here. He quotes George Agar Ellis to the effect that "the reciter is a Turkish fisherman," etc., etc., with evident approval. Yet by-and-by (p. 123) he burkes the fisherman and proposes, to explain the last part of the poem, "a kind of dialogue between the author and the protesting monk," followed by the infidel's confession. "Who speaks verses 467-472?" is a question to which neither Ellis's hasty theory nor Mr. Coleridge's imperfect and baffling combination affords any reply. The fact is, Ellis's fisherman-narrator, though he has a conventional standing in the world, is a good deal of a humbug. Byron's own note shows clearly who is meant to be the narrator. "I heard the tale," he writes, "recited by one of the coffee-house story-tellers who abound in the Levant. . . . I regret that my memory has retained so few fragments of the original." This, if rightly taken, reveals the precise kind of literary artifice which the poet had in mind, and enables the reader, without much difficulty, to arrange the acts and scenes, and to distinguish the presenter from the *dramatis personæ*. The fisher who, "fearful for his light caïque," rows ashore at Port Leone, may be one of the actors, or he may be a mere bit of motion in the evening landscape. It is not easy to see how he can be the teller of the story. The debate is still alive in Germany, where scholars seem to be as oblivious of Byron's authoritative explanation as Mr. Coleridge himself.

Worse than this is Mr. Coleridge's queer treatment of "Lara." Byron's remark that, "the reader may probably regard [the poem] as a sequel to the 'Corsair,' " he calls "an admission which forestalls and renders nugatory any prolonged discussion of the subject." "It is evident," he adds, "that Lara is Conrad, and that Kaled, the 'darkly delicate' and mysterious page, whose 'hand is femininely white,' is Gulnare in a transparent and temporary disguise." Now, under favor, these words could never have been written by anybody as familiar with both poems as an editor ought to be. "Prolonged discussion" is, indeed, unnecessary. Whether or not Lara is Conrad, Kaled is certainly *not* Gulnare. Kaled, on a memorable occasion, refrained from tearing "the glossy ringlets of his raven hair" (v. 1,155). Gulnare's hair was auburn:

"That form, with eye so dark and cheek so fair,
And auburn waves of gemmed and braided hair."
—(*Corsair*, vv. 1008-9.)

Of course, Byron "visualized" Gulnare and Kaled. He had seen both ethnological types often enough in the East. But there is no absolute need of appealing to the hair and complexion of the heroines. Between the heroes themselves there are many slight differences—actual or psychological—that forbid their identification. Byron's use of the word "sequel" has been driven too hard. Mr. Coleridge should have compared the letter to Murray, September 2, 1814, in which the poet speaks of "Lara" as "connected with the other tales," and adds: "I would recommend this arrangement—Childe Harold, the smaller poems, Giaour, Bride, Corsair, Lara; the last completes the series, and its very likeness renders it necessary to the others." This shows well enough the loose sense in which "sequel" was employed in the passage which has led the editor so far astray.

In quoting parallel passages and tracing illusive tags of phrase, Mr. Coleridge errs in two ways—by inclusion and by exclusion. Exhaustiveness is impossible; perfect consistency is a vision; but an editor should try not to be freakish. Nothing is gained by comparing the couplet—

" 'Tis the clime of the East, 'tis the land of the Sun—
Can he smile on such deeds as his children have done?"

with Young's

"Souls made of fire, and children of the Sun,
With whom revenge is virtue."

The verbal resemblance is commonplace, and the similarity in thought is shadowy. And why quote Pippa's "God's in his Heaven, all's right with the world!" in connection with v. 651 of "Lara": "The Sun is in the heavens, and Life on earth"? There is no contact in ideas between the two passages. On the other side of the account, Mr. Coleridge neglects to register a number of real allusions—to Macbeth, for example, in "The Bride of Abydos," v. 1,127, and "Lara," vv. 190, 357, and to Othello in "The Corsair," v. 239. Trifles, no doubt, but worth noting—especially in view of Byron's familiarity with Shakspere, which comes out on every page of his correspondence. It is not to be imagined that Mr. Coleridge omitted the passages because he regarded such jottings as trivial. If so, his ideas of triviality must be rather vague, for there is much inconsequent matter in some of his foot-notes. To trace, for example, the spirited opening of "The Siege of Corinth" to a feeble stave in an "old ballad" (p. 449) is not only trivial, but wrong. Besides, the piece in question is not a ballad at all, as Mr. Coleridge's authority, the late Prof. Kölbing, knew very well. Even further-fetched is the attachment of the Corsair's character, by some occult bond of literary derivation, to Malefort Junior in Massinger's "Unnatural Combat" (p. 219). True, Mr. Coleridge has had many predecessors in such elaborate trifling. One note of Moore's, which he perpetuates, is the nonpareil. In this owlish comment the splendid Grecian passage in "The Giaour" is referred for its origin to the following words from Gillies's 'History,' quoted in "a book which Lord Byron is not unlikely to have consulted": "The present state of Greece, compared to the ancient, is the silent obscurity of the grave contrasted with the vivid lustre of active life." The antithesis between life and death was in the world before Gillies! —We do not wish to be misunderstood. The tracing of thoughts and allusions, and the accumulation of parallel passages, are part of an editor's business. Even when there is no likelihood of borrowing, such things illustrate the atmosphere which surrounded an author, and have their value. But the canon of reasonableness must be heeded, or annotation degenerates into the hit-or-miss scribbling of casual marginalia.

We do not find Mr. Coleridge completely intelligible in his interpolation (from the MS.) in Byron's comment on vampires (p. 123). It looks as if he were unaware that freshness and ruddiness of complexion is one of the unfailing signs by which a corpse is recognized as subject to vampirism. But perhaps we misunderstand. The authorities cited are well chosen, and will put the reader who verifies them into possession of the main facts. It seems strange, however, to omit Bernhard Schmidt, whose information about the modern Greek beliefs would have been peculiarly apposite. The note on the story of the "sultan in the bath" is not quite precise, interesting as it is. Mr. Coleridge can hardly be expected to know Reinhold Köhler's little essay in an early volume of *Germania*, but he might well have followed his own clue a little more industriously—to 'The Forty Vezirs,' perhaps. The note on Alp "the Adrian renegade" in "The Siege of Corinth" (p. 454) is not so novel as Mr. Coleridge thinks. It has been partly anticipated by W. Bang in *Englische Studien*, vol. xxvi., p. 138. The editors of Murray's Byron know the *Studien*, with which the Byronic investigations of the late Professor Kölbing have brought them into contact. Bang's note is minute, however, and it was not hard to overlook it. One note of Mr. Coleridge's is downright ludicrous. It is a gloss on *tier* in "The Corsair" (p. 288)—

"She bears her down majestically near,
Speed on her prow, and terror in her tier."

" 'Tier,' " writes Mr. Coleridge, "must stand for 'hold.' " This is on the same page with the unmatchable "blood-rag flag," to which it is a fitting pendant. The pirate-ship, then, carried her armament in her hold. No wonder there were ups-and-downs in Conrad's life if his followers adopted this arrangement habitually when, as now, they "sailed prepared for vengeance"!

The "Poems of the Separation" have a good introduction and are well annotated but for one surprising omission. Mr. Coleridge has actually contrived to edit the pieces in an elaborate manner without telling us anything about the original of "A Sketch." Will it be believed that the name of Mrs. Clermont is not once mentioned in notes or introduction? Certainly there is no occult reason for such reticence. There is no secret about the affair; the facts are all in Mr. Prothero's volume and are matters of common knowledge. Mr. Coleridge has simply forgotten to make the most obviously necessary of all notes. He will doubtless be as startled as any one when he learns of his delinquency.

Byron was notoriously disregardful of grammatical niceties, and his editor feels bound to call attention more than once to defects in style or syntax. But a poet may be "*super grammaticam*"—as Mr. Coleridge calls it (p. 526), meaning probably *supra*, or is this another misprint?—when the same prerogative is denied to his scholiast. Mr. Coleridge, however, accords himself the privilege in question when he says "the *Bride of Abydos*, as well as the *Giaour*, embody" (p. 150) for "embodies," and "It does not occur to him to condone . . . the loves of Hugo and Parisina, and in detailing the issue leaves the actors to their fate" (p. 500).

One turns with pleasure from Mr. Coleridge's volume, valuable as it undoubtedly is, despite its carelessness in detail, to vol. iii. of the 'Letters and Journals,' prepared by Mr. Prothero. This covers the period from January, 1814, to November, 1816, adding more than a hundred letters to Halleck's collection, hitherto the most complete. Almost all the new matter is interesting, some of it singularly so. We may specify fifteen letters, or parts of letters, from Byron to Miss Milbanke. Mr. Prothero has done his work with as near an approach to perfection as one can ever hope to see. We have nothing to modify in the admiring testimony which we have borne to his taste, skill, and good judgment on other occasions. Particular attention may be called to the Appendix to chapter xii., in which the documentary evidence bearing on the separation is presented with great fulness and in a very orderly manner. It is to be hoped that some professional alienist will scrutinize this material with a view to determining whether what is now called "persecution mania" on the part of Lady Byron may not explain much that has puzzled the biographers. Mr. Prothero, by the way, would be an excellent person to run over Mr. Coleridge's proof-sheets in the future. His inspection would insure the finish which alone is wanting to make the editing of the 'Poems' as excellent as that of the 'Letters.'

MORE NOVELS.

Voices of the Night. By Flora Annie Steele. The Macmillan Co.

An Unsocial Socialist. By G. Bernard Shaw. Brentano's.

Hilda Wade. By Grant Allen. G. P. Putnam's Sons.

The Monk and the Dancer. By Arthur Cosslett Smith. Charles Scribner's Sons.

His Lordship's Leopard. By D. D. Wells. Henry Holt & Co.

The Action and the Word. By Brander Matthews. Harper & Brothers.

The Jimmy John Boss. By Owen Wister. Harper & Brothers.

The Goodness of Saint Rocque. By Alice Dunbar. Dodd, Mead & Co.

By the Marshes of Minas. By C. G. D. Roberts. Silver, Burdett & Co.

The Autobiography of a Quack. By S. Weir Mitchell, M.D. The Century Co.

The Seafarers. By Mary Gray Morrison Doubleday, Page & Co.

Mrs. Steele's recent novel, 'Voices of the Night,' has for secondary title "A Chromatic Fantasia," and the author apologizes for attempting to play an elaborate composition on a penny whistle. The inexpensive instrument with which Mrs. Steele identifies herself, or her novel, is certainly incompetent to produce sounds in interesting combination and succession, but it has a power shrill and peremptory of compelling those who have ears to hear. This penny-whistle power is the very one in which 'Voices of the Night' is conspicuously deficient. It is a tedious, incoherent piece, without vivid moments, without a single passage to compel attention and hold the memory. The love romance is a convention wherein the author wrests from causes stated an effect impossible to reason. Equally conventional (in the novel of India) are the Englishmen of dark experiences and perfect manners, who with English ladies (not above suspicion) dance for ever in the dark on the verge of an abyss, striving thus to escape the memory of past horrors and avert a hovering dread of their repetition. For the plot, it is possible that Mrs. Steele may know what she meant to tell about stolen pearls and lost memoranda of political significance; also, why she considered these things important enough for revelation; but, unless she should publish a summary with italicized connections, no one could share her knowledge. What she may know, believe, or fear about a profound hostility cherished by Oriental subjects, of whatever race, caste, and condition, towards their Western rulers, is stated, in the veiled manner of oracles, in parables that may mean anything or nothing. Our only definite inference is, that no matter what the Government may do, it is and must always be wrong. Sacred superstitions, however revolting, must be respected; sacred households where wife-murder is a pastime must not be invaded; sacred filth must not be disturbed, because the subject races attribute the quality of sacredness to these conditions and objects so flagrantly repulsive to people of different tradition. Yet if, while a tactful and tender administration is pursuing the *laissez-faire* policy advocated, an amulet that is a message of riot should be sold by the million, or a zenana scandal agitate the missionaries, or the plague devour a certain quarter, it is clear that the Administration is slothful, irresolute, utterly incompetent to deal with the tangled problems of the Indian Empire. To discuss usefully such serious and complicated questions, it is well to have formed definite opinions and to know how to appeal to reason. It is rather unfortunate for Mrs. Steele's reputation that she did not more carefully examine her conscience before embarking on 'Voices of the Night.'

Mr. Bernard Shaw often chooses to discuss serious topics, but should not be subject to a suspicion of desiring to write usefully. 'An Unsocial Socialist' is a characteristic work, extravagant, artificial, overflowing with bad taste, and alive with an insolent personal force which commands admiration as it forbids esteem. The only dull passages are the Socialist's lectures on Socialism. His theories have long ceased to surprise, and there was probably never a time when they would have appealed to any one capable of feeling conviction. The three girls whose pranks at school, and later, make up the tale, are not like any sort of commonly known girls, nor do they approach any conceivable standard of model girl, but are inventions endowed with certain feminine qualities and caprices which the author seems to light upon by an inspired guess.

It is commonly reported that Mr. Grant Allen wrote fiction neither from choice nor for fame, but only to keep the pot boiling. Little of his fiction discredits the rumor, and, once in a while, he undoubtedly hit his mark. His last book, 'Hilda Wade,' is a series of unrelated incidents connected by the adventures and love affair of a doctor and nurse. The nurse has a phenomenal memory, which absorbs the marriage column in the newspapers, and by prompt and efficient use gets her a great reputation both for scientific observation and for the spirit of prophecy. The doctor just gasps, wonders, adores, and cheerfully abets any wild project initiated by the nurse to satiate her quite antique thirst for vengeance upon a famous surgeon, who is incidentally a perjurer and murderer. The view of a great hospital as a theatre for the exploitation of private passion and intrigue is very alarming. But Mr. Allen was not a writer of purposeful fiction, so he had not to fear the revenge of a host of doctors and nurses all secretly vowing and plotting to have his blood.

Among volumes of short stories for summer reading, that entitled 'The Monk and the Dancer' is at once the lightest and the deepest. The antithesis of the title is comprehensive. Throughout the volume, the intensity of life touches its frivolity, the mystery of death attends its commonness, the passion of love goes along with its lightness, and the things that are push aside the things that seem. If Mr. Cosslett Smith were a Frenchman, he would be labelled "Symbolist," but we are not keen about relegating our authors to schools, so he may be let off with the comment that, for such an amusing writer, he is a little odd, and certainly means more than he actually says. His incidents are not commonplace, but rather picturesque or extravagant or unusual, and he presents them completely, yet with remarkable conciseness. With an air of impulsive spontaneity, his work is really the expression of a well-comprehended art, at once strong and delicate, and distinctively a product of the last years of the nineteenth century.

The adventures narrated in 'His Lordship's Leopard' are farcical, vigorous at first, but gradually attenuating and culminating in a joke which supplies the title and is bad enough to depreciate the best of tales. Only people quite bereft of reason would have dealt with complications after the fashion of Mr. Cecil Banborough and the strolling players; but the spirit of the moment is well given and infectious, and the author never meant that any one should think about the book after it was closed.

The 'Action and the Word' might easily have been a short story; indeed, it could hardly have been made too short. The lady of fashion who, prompted by vanity, a desire for notoriety, and more money, contemplates going on the stage, is so emphatically a back number that she is not worth more than a curt notice to a society journal. Mr. Matthews's lady contemplated but didn't, which makes the many chapters devoted to her indecision even more superfluous. The joy that may be taken in the eating, drinking, and dressing of wealthy people is one that cannot be conveyed through type and shared by a reader, and no one would complain of Mr. Matthews's selfishness if he should give it up and never try again to impart to others such sensations of delight. Commonplace talk around a dining-table may seem to the talkers as brilliant as their persons and the plate, but, transferred to print, it stands for itself, alone, unprotected, appealing to the cold mind's eye of the stranger. Subjected to such a test, the assertion that a woman is or is not good-looking, oft repeated, in varying phrase, loses that extraordinary interest which accompanies its utterance by externally perfect beings eating perfect viands and drinking copiously perfect wine. Mr. Matthews has done his best with that sort of conversation, and might now stop reporting it, because the public will come to think either that he never hears any other sort, or that, if he does, he forgets it. Some may even accuse him of doing all the talking himself

Mr. Wister's new tales of the West when it was wild, take their general title from a cowboy's transformation of the word "demijohn." In the first story the characterization of the young boss and his old German employer is excellent, and the boy's management of his turbulent ranchmen quite justifies Max Vogel's belief in his own talent for selecting the fittest. The other tales are inferior to the first in form and finish, except, perhaps, the last, which has a pretty sentimental strain unusual in Mr. Wister's work. The whole book is a panorama of days that are done, days much favored of the gods in having their memory kept green by two such writers as Bret Harte and Owen Wister.

Among tales of locality there are few volumes more pleasing than 'The Goodness of Saint Rocque.' In New Orleans one need not go far to find the romantic, and the city has been an easy prey for indifferent story-tellers. Mrs. Dunbar has disregarded striking, almost importunate, material, and found her subjects in quiet corners. Her sympathetic and refined manner gives a literary value to slight incidents and simple characters.

In 'The Marshes of Minas' Mr. Roberts continues to regard with a romantic eye the patient peasants and fishermen who inhabited Arcadia when it was ceded by France to England. His imagination is not fettered by a too profound knowledge of their character and habits of life—a remark which may be extended to his illustrator's conception of their costume. As usual, the author's narrative lacks life and probability, and, as usual, too, his genuine poetical talent finds expression in many beautiful descriptive passages.

'The Autobiography of a Quack' is a very disagreeable tale. The picturesque ruffian is a traditional figure in fiction, but the blackguard who is just base and vulgarly criminal, without one engaging attribute, is only an unpleasant expression of a transient craze for realism. The second tale in the volume has no more general interest than has a surgeon's report of a famous case, which he describes accurately without sentiment or sympathy. If these be doctor's diversions, a doctor's life is indeed a distressing one.

In 'The Seafarers' there are two well-drawn characters who, indeed, dwelt by the sea, but, during the time of the story's action, at least, stayed steadily on shore. Both are old men, one a soldier, the other a shipowner; and, as the author is presumably young, she is to be complimented on her rendering of crabbed age. The plot is wild quite beyond compare, sufficient indication of a "first book" without the accompanying explanatory advertisement.

Ueber den physiologischen Schwachsinn des Weibes. Von P. J. Möbius. Halle a. S.: Carl Marhold. 1900. 8vo, pp. 26.

Antropologia pedagogica. Da C. Melzi. Arona: Tipografia Economica. 1899. Pp. vii+246.

Studies in the Psychology of Sex. By Havelock Ellis. New York: The F. A. Davis Co. 1900. 8vo, pp. xi+276.

That a German psychiatrist, an Italian teacher, and an English man of science should fail to agree in their views of woman and her ways is no great wonder. Möbius, characteristically enough, begins his essay with a protest against the use of *Frauen* as the plural designation of the creature contrasted with *Mann*. If women are ashamed of their rightful name *(Weiber)*, says the author, "that is bad enough, but no reason for doing violence to the language." With Möbius, *Schwachsinn* lies "between imbecility and normal-mindedness," for which last expression he laments the non-existence of a trite German word. The usual items concerning the "intellectual inferiority" of woman, her "anatomical bestiality," etc., are here repeated with a conciseness of speech and a tendency to epigrammatic brevity rather unusual in such writings. There is also some wit at the expense of woman's "instinctiveness," a few hits at "the modern woman" and the "feminists," and a good deal of vamping of old material of the "weaker-vessel" sort. The author has evidently not acquainted himself with the data in such books as Havelock Ellis's 'Man and Woman' and Mason's 'Woman's Share in Primitive Culture,' or some of his naïve remarks about woman past and present would be conspicuous by their absence. That all progress has proceeded from men alone, that women have never had any sword but their tongues, that invention is a thing denied woman by nature, that women have done next to nothing to advance culinary art (and sartorial art as well), that medicine has practically no use for women practitioners, that science has nothing of any value to expect from woman's activities, are statements so bald as to suggest, quite apart from national prejudices, an ignorance of the literature of the subject, or, at least, an overlooking of it. It may be satisfactory to the author to conclude that "woman not only is inferior to man intellectually, but also loses more quickly than he does her mental faculties," and that the phenomena of old age are all to the disadvantage of woman as compared with man; but such dicta need a great deal more proof than is vouchsafed us. There is, too, more sarcasm than truth in the declaration that, once she has "caught a man," woman is another being, a harmless creature, whose existence from that time forth is altogether a losing game. Möbius approves of the popular saying that woman ought to be *gesund und dumm:* for her, science should remain an untouched field, for the cultivation of which she has a natural incapacity. Views like these are still held in high places in Germany no less than among the masses of the people, but within the last few years serious breaches have been made in folk and academic belief, which promise a fairer future, even if it be afar off.

The bulk of Melzi's book is devoted to "pedagogical anthropology," as what we know as "child study" in America is often called in Italy. Here we can concern ourselves only with his discussion of the "Education of the Sexes" (pp. 189-219), which is a good antidote to Möbius. Melzi, who has been trained under Sergi, is one of the leaders in Italian school-reforms, and a teacher in the city of Arona. While admitting, and in no way seeking to minimize, the existence of noteworthy physical and psychical differences between the sexes, and liking no more than Möbius the virago and the defeminized anomaly, the Italian writer pleads for an education that shall make the best of all there is in woman. Sexual education is as just as sexual selection. The shortcomings of modern educational systems, in unholy alliance with her known failings, have long enough dictated the paths of woman's possibilities. In marked contrast to Möbius, Melzi heralds the passing of the old prejudice which has insisted upon a literary rather than a scientific training for women (p. 213). Science alone, he thinks, can save woman from her infantilism, which man has so exploited to his own advantage in times past; science can alone add the character woman so much needs. What must come to woman from the "new education" is that real, not dilettante, scientific knowledge which shall "invigorate her powers of observation, increase her volitional energies, strengthen her attention, broaden her rational field, clarify her concepts and her judgments, make her memory less automatic, restrain her fancy and her imagination," make her, in fact, what nature planned, "a perfect woman." No bastard science will serve her; the new régime must be honest and natural. Its foundation must be liberty to be all she can, in the best way she can, when best she can. And through it all she will remain woman. There is no danger of her debasement.

If ever Prof. William James's motto, "Be not afraid of life!" takes on a profounder significance than elsewhere in the world of human phenomena, it is in the presence of those facts to the elucidation of which Havelock Ellis is devoting the best years of his life. The volume under review is not exactly a book for Mrs. Grundy, but the perusal of some parts of it would sanify not a few of her most deluded victims. Nowhere else can one find a résumé of the best scientific thought about sexual life in its narrowest and in its broadest implications. Among the topics discussed are: The Evolution of Modesty; The Phenomena of Sexual Periodicity; Spontaneous Manifestations of the Sexual Impulse; Influence of Menstruation upon the Position of Women; Sexual Periodicity in Men; The Auto-erotic Factor in Religion. True, these are most of them tabooed subjects, but their fundamental importance must be confessed, and the author deserves the gratitude of every unprejudiced man and woman for the great mass of facts he has here made available. We all do not know how, from being with savage and barbarous peoples "a fundamental social law of life," modesty has become, with the progress of civilization, "a grace of life." Still less are we fully acquainted with the real significance of "spring fever" and all that rhythmic outburst stands for. We can heartily agree with the author when he says (p. 203): "The sexual impulse is not, as some have imagined, the sole root of the most massive human emotions, the most brilliant human aptitudes—of sympathy, of art, of religion. In the complex human organism, where all the parts are so many-fibred and so closely interwoven, no great manifestation can be reduced to one single source." Still, the place it fills is very large, and its ramifications are almost everywhere. Not even the male half of mankind, as is here clearly shown, are at all independent of the sexual rhythm; but the field is one for further study and speculation.

The view of woman resulting from investigations and studies like those carried on by Havelock Ellis is an eminently sane and sensible one. In a considerable portion of Christendom, however, woman has rather lost than won as compared with her position in the thought of many primitive peoples. Woman, always the witch, has ceased to be the prophetess. And modern Germany seems more inclined to agree with the mediæval preacher who termed woman *bestia bipedalis*, than with the ancient Teutons, who, as Tacitus reports, saw in her *sanctum aliquid et providum*. To judge fairly between these two extremes of the old animistic conception, so current in the world to-day, we need "a clear and full discussion of the problems that centre around sex." Not until then shall we fully understand the "angel-devil" whose sweet name is woman.

A White Woman in Central Africa. By Helen Caddick. Cassell Co. 1900. Illustrated. 8vo, pp. viii, 242.

Miss Caddick tells the story of her journey from the mouth of the Zambesi to Lake Tanganyika in a simple but entertaining way, interspersing it with many humorous touches. Though she had no startling adventures and kept to well-known routes, her descriptions of the varied aspects of African life are full of interest. She is an intelligent observer, and her great tact and kindliness in her treatment of the natives are attested by the success of her excursion. To the head of navigation on the Shiré and on Lake Nyassa she travelled by steamer, but the rest of the way she was borne in a "machila" or hammock, swung from a pole and resting on the shoulders of two natives. She was thus carried up and down mountains, through forests and across torrents, for more than a thousand miles, with such care that she had only one fall. Her "boys," who were frequently changed, were invariably good-tempered, with "any amount of patient endurance and also a keen sense of humor." Their consideration for each other was shown by an incident that was not solitary of its kind. One intensely hot day,

> "when my boys were getting tired, we passed six or eight natives walking along without any loads. They began to chaff my boys and jeer and laugh at them. Suddenly, two of them made a rush at the machila pole, pushed my boys away, and ran off with me as fast as they could, up and down steep 'dongas,' so steep that I should have had to walk down them with the greatest care. The rest of them came alongside, shouted and sang all the time, and, without stopping, a fresh pair took the machila pole, changing as they ran. They kept up this pace for more than an hour, until we came to a stream where there was shelter from the sun. Then they popped me down. . . . Of course, this helped us over the ground splendidly, and after a rest we went on more calmly, leaving our lively crew behind."

Even the children were unselfish. At every morning halt they gathered around Miss Caddick, and she was accustomed to amuse them by teaching them to catch bits of biscuit she threw to them. "Those who were successful," she always noticed, "saved their biscuits, and at the end divided them with those who had been less fortunate." Altogether, she leaves upon her readers a far more favorable impression of the natives for their industry, honesty, good humor, and cleanliness than do most African travellers. In the region between the two lakes she says that "in all the villages the people seemed busily occupied with their work; the ground was kept swept round the huts, and they were cleaner and less malodorous than our courts and alleys at home." Here "the men do all the sewing and mending of what little clothing they have," and one of the reasons for divorce is "if the husband neglects to mend anything belonging to his wife"; and "if either speak disrespectfully of the other's friends . . . the marriage can be dissolved." Among their industries is the making of bangles out of the finest copper wire twisted on hair.

> "The drawing of the wire is cleverly done. The men cut a hole through a tree, into which they put a piece of iron with a small hole in it. The strip of copper is tapered to a point and put through the hole in the iron. The natives catch hold of the end with a kind of pincers, then a good number of them hang on to it and pull it through. This process is repeated through smaller holes in the iron again and again till the wire is fine enough."

Though Miss Caddick makes but brief references to the life of Europeans or missionary work in the Central Africa Protectorate, her journey alone furnishes remarkable evidence of the progress of the country under British rule. Not in the roads, the coffee plantations, the stations, churches, and schools is this to be found, but in the simple fact that a woman, with no companions but natives picked up almost at random and frequently changed, could travel a thousand miles in perfect security. For days together she saw no white persons, and she carried with her riches of untold value to her boys. At every camp, calico was unrolled, beads and salt were brought out to barter for food and ornaments, and not a yard of cloth or a bead was stolen. Yet this was a country where, a few years before, the people lived in caves and kraals in the sides of ravines or on the top of almost inaccessible hills to escape the slave-raider, and fled in terror at the sight of a stranger. Then, every tribe and nearly every village was the enemy of every other. The favorite amusement of Miss Caddick's carriers shows the condition from which they had just emerged. They lay in wait at the side of the path, and rushed out at her approach with fierce yells, brandishing their spears and axes as if about to attack the traveller. Then, Yaos and Angoni were deadly foes; now, they help to bear each other's burdens. The chief value, in fact, of Miss Caddick's story is that it is another chapter in the history of the regeneration of Africa.

The illustrations are excellent and the general appearance of the book is very attractive, but a map was due to those unfamiliar with the geography of this part of the continent.

Pottery and Porcelain: A Guide to Collectors. By Frederick Litchfield. Containing 150 illustrations of specimens of various factories, seven colored plates, and marks and monograms of all the important makers. New York: Truslove & Comba. 1900. Pp. xv, 362.

From 1870 to 1885, or thereabouts, there were published many handbooks and histories intended for the edification of the collector, or would-be collector, of ceramic wares. Of late there has been a pause in this industry, and perhaps it was as well for the compilers to wait a while and see what the research of investigators in special departments might develop. So much has been brought to light and so much made apparent by comparison and discussion, that books of to-day have every chance to be more useful than those of even fifteen years ago; and therefore it is well to have books of to-day. Mr. Litchfield, the author of a useful account of European furniture, has gathered together and arranged with a great deal of skill the material which this volume contains, and has prepared photographic illustrations for it, both colored and simply printed in black (in half-tone); and with these a very considerable number of little cuts in the text, most of which are "marks and monograms."

The practised student knows in advance what such a volume, of moderate size but proposing to include all the history of decorative ceramic ware, is pretty sure to be. If it should contain any remarkable achievement in the way of solving a problem, correcting an important date, dividing into schools what has been too hastily assumed to be of one group, or any achievement of that character—if any such success were to be scored in behalf of the author, it would be indeed remarkable. The present work hardly pretends to such a marked success as that would be. The preface declares that the book is a practical guide, and it goes safely along the beaten track, thereby serving its readers well; for who are they who, wishing to be better informed concerning the decorative objects in the dealer's shop or the auction room, would desire other than the accepted beliefs? With great frankness the opinions and statements of many different writers are quoted or cited, and their authors credited with what they have contributed to the common stock of knowledge. With a certain uniformity of even appreciation, the wares of the East and the West, of old and of modern times, of England and the Continent, are described, and, if not criticised, at least so far appraised that the student may form a tolerable idea of what is best worth his examination. It would be impracticable to avoid serious errors, both of statement and of comparative description, and accordingly it is rather amusing to read the brief account of the porcelain of Japan, which it appears was kept locked up "until about 1859, when the famous visit to the country of Lord Elgin and Commander Perry resulted in certain ports being thrown open to foreign trade." Faulty chronology for an act of doubtful morality and of wide-reaching consequences. And so it is odd to see that recent investigation into Japanese records makes no figure at all in the author's notes, and that the village potteries discovered and sampled so judiciously by Morse remained unnoticed. On the other hand, the artistic appreciation, if it may be so called, which is bestowed upon the ancient and the modern wares, is judicious and appropriate to the small space which could be allowed for it. The conclusion would seem to be that the author has worked mainly in London shops full of a constantly changing assemblage of specimens and with all the best books at his command, but with little information except that which is easily drawn from those two sources. The reviewer hastens to state that nearly all the information there is may be obtained in that way; the vital difference being that that which is not so obtainable is by far the most interesting and on the whole the most important.

The pages devoted to Greek vases are very few, and Egyptian pottery can hardly be said to be noticed at all. Ancient British pottery receives a page of comment, while Mexican and Peruvian pottery does not appear to have interested the author at all. All this is entirely characteristic and in place; for the student of ceramics, or would-be collector, the person who buys, or would buy if he could, decorative pieces for his enjoyment and to show to his fellow-collectors, is to be separated decidedly from the student of those ancient or little known wares. It may be said that the buyer of Greek vases is to be classed among a different order of students and of readers from the buyer of Oriental ware or of the faïence of the eighteenth century. Even as the book devoted to Greek or Greco-Roman archæology says nothing about other potteries than that which may be included under that head, so does the writer on "pottery and porcelain" in a general way ignore almost altogether the potteries of classical antiquity. This custom has become recognized, and one would hardly expect to find in a book like this anything profound or complete devoted to Greece, Etruria, Egypt, the Phœnician peoples, or the Roman Empire. In like manner the reader will not expect to find anything detailed or of value concerning the out-of-the-way and little studied potteries of Europe or of the near East. One district is named and another is not, but the name is about all that is vouchsafed to the wares of Anatolia or of the Italian mountain villages, or again of the more nearly civilized tribes of Africa, while, as has been said, South America and Mexico are ignored. It is, therefore, for the collector of modern European wares primarily, and in a secondary degree for the lover of Oriental pieces, to buy this book and to use its full index and its systematic arrangement for all it may be worth.

A Memoir of Henry Jacob Bigelow, A.M., M.D., LL.D., etc., etc. Boston: Little, Brown & Co. 1900. 4 volumes.

The first of these four interesting volumes is devoted to a substantial memoir of Dr. Bigelow, the authorship of which is not stated, and to various shorter memorial addresses and tributes from his colleagues and from the medical press; the other three to publications and addresses mainly on medical subjects. The first is, perhaps, the only one that will appeal greatly to the layman, but few persons will take this up without reading it with sustained pleasure to the end, so clearly do the attractively written pages give proof of the brilliancy and genius of the well-known surgeon whom they commemorate.

The memoir opens with a brief sketch of Dr. Jacob Bigelow, the father, a man as remarkable as his son, with rare intellectual gifts, and a temperament of wonderful elasticity and freshness. Then follows a sketch of Henry Bigelow's youth, bearing witness to a spirit, an energy, a versatility which stamped him as a man sure to grow and to lead, though a discerning prophet might early have suspected that the "drudgery of practice" would prove "distasteful to him." Although threatened with serious pulmonary disease, his fresh, ambitious, and hopeful spirit contributed largely to the success of the care by means of which he was enabled to endure the fatigues of a long and busy life. Boy or man, the paths he elected to tread were often new, his methods always original; and his early life was in piquant contrast with his staid surroundings. Had he not been a distinguished surgeon, he might easily have been a distinguished naturalist, inventor, horticulturist, even art critic. One is inclined to ask whether, if his interests had been more concentrated, his achievements in surgery might not have been still greater; but people must be taken as they are, and his genius was of the kind that impelled and enabled him to follow one line with intensity and extreme thoroughness for a time, but for a time only.

> "In 1849, though hardly more than established as a practitioner and hospital surgeon, Dr. Bigelow received his appointment as professor of surgery in Harvard University. . . . It might be said that he was without competitors for the high and honorable position to which he was chosen at the early age of thirty-one years."

As a teacher he had an unusual instinct for divining the essentials among the vast number of facts which confronted the student, and for presenting them with such terseness and clearness that they made an indelible impression upon his hearers' minds, and this same clearness of insight enabled him, throughout his career, to select the vital elements in all the subjects of his investigation.

His public services were, naturally, not numerous; but in 1861, at the outbreak of the war of the rebellion, he "delivered by invitation a gratuitous course of lectures, chiefly on operative surgery, for the benefit of medical men whose services seemed likely to be demanded by the exigencies of the time," and in 1862 he was sent to the front on a private and responsible mission of inspection by Secretary Stanton. He also delivered a public address at the unveiling of the Ether Monument in the Public Garden. For many years before his death Dr. Bigelow withdrew from active practice, and spent much of his time at his beautiful retreat of Tuckernuc and on his hillside in Newton, his tireless energy always providing him with new pursuits of an original sort.

This is not the place to speak at length of Dr. Bigelow's position in the scientific world, although the three generous volumes which follow the memoir, and are respectively entitled 'Surgical Anæsthesia: Addresses and Other Papers'; 'Dislocations and Fractures of the Hip: Litholapaxy'; 'Orthopedic Surgery: Medical Papers,' give ample testimony that he was a clear and forcible writer as well as a great surgeon, and that his principal contributions, if not many, were of lasting value. It is quite in keeping with more than one side of his nature that he should have been prominent among those who welcomed the birth of surgical anæsthesia through sulphuric ether, and supported the claims of the man whom, with his practical insight, he saw to be the one that deserved the credit of the discovery. For, besides his clearsightedness, it was an eminent characteristic of Dr. Bigelow—a strange one, some might think, in a surgeon of that day—that he shrank with over-sensitiveness from inflicting or witnessing pain. But it is by the positive side of his nature, by what he accomplished, and by the bright picture of genius which he presented, that he will be remembered; and to these aspects of his life and character this memoir will serve as a fitting and fascinating tribute.

BOOKS OF THE WEEK.

Bliss, W. R. Colonial Times on Buzzard's Bay. New ed. Houghton, Mifflin & Co. $1.50.
Collier, W. M. The Trusts; What Can We Do with Them? What Can They Do for Us? The Baker & Taylor Co.

History, etc.

Henderson's Side Lights on English History.

With 80 full-page illustrations from the rarest original engravings. 300 pp. 4to. $5 00, *net special.*
Historic matters as described and pictured by contemporaries.
N. Y. Tribune—"A better book to put in the hands of the lover of history, whether he be a beginner or an old student, we do not know."

Lee's Source Book of English History.

Edited by Dr. GUY CARLETON LEE of Johns Hopkins. xvii+809 pp., 12mo. (*Sept.*)
Leading Documents from the earliest mention of Britain to the last treaty with the Boers.

Graham's English Political Philosophy.

From Hobbes to Maine. 415 pp. 8vo, $3.00, *net special.*

Walker's Discussions in Economics and Statistics.

By the late General FRANCIS A. WALKER. Edited by Prof. DAVIS R. DEWEY. *With portrait.* 454+481 pp. 2 vols. 8vo. $6.00, *net special.*
The Dial: "Clear and interesting to the general reader, as well as instructive to the careful student."

Daniels's Public Finance.

By Prof. W. M. DANIELS of Princeton. 373 pp., $1.50, *net.*
Prof. Wm. Z. Ripley of Mass. Institute of Technology: "In almost all details it accords with my idea of a textbook for such classes as ours. . . . It is a book of sound views and suggestive character."

Seignobos's Political History of Contemporary Europe, 1814-1896.

Edited by Prof. S. M. MACVANE of Harvard. 860 pp. $3.00, *net.*
Prof. H. Morse Stephens of Cornell: "**The best history of Europe in the Nineteenth Century that has yet appeared.**"

Champlin's Young Folks' Cyclopædia of Persons and Places.

New Edition. 958 pp., 8vo, $2.50.
About 500 *of the articles and three-quarters of the illustrations are new.*

German

Sudermann's Frau Sorge.

Edited by Prof. GUSTAV GRUENER of Yale, *with portrait.* xx + 268 pp. 16mo. 80c., *net.*

Hauptmann's Versunkene Glocke.

Edited by Dr. T. S. BAKER of Johns Hopkins. xviii+205 pp. 16mo. 80c., *net.*

Schiller's Thirty Years' War.

Selections portraying the careers and characters of *Gustavus Adolphus* and *Wallenstein.* Edited by Prof. A. H. PALMER of Yale. xxxvii+202 pp. 80c., *net.*

Baumbach's Sommermärchen.

Edited by Dr. EDWARD MEYER of Western Reserve University. *With vocabulary.* 142 pp. Bds., 35c., *net.*

Bierwirth's Elements of German.

By Dr. H. C. BIERWIRTH of Harvard. 277 pp (*Aug.*)

Wenckebach's German Composition. Based on Humorous Stories.

By Prof. CARLA WENCKEBACH of Wellesley. 282 pp. 12mo. $1.00, *net.*

Vos' German Conversation.

By Prof. B. J. VOS of Johns Hopkins. *With vocabulary.* xvi+176 pp. 12mo. 75c., *net.*

Poll's German Prose Composition.

By Dr. MAX POLL, with vocabulary by Prof. H. C. G. VON JAGEMANN, both of Harvard. 133 + 168 pp. 12mo. 90c., *net.*

Sweet's Study of Languages.

By Dr. HENRY SWEET, of Oxford. 280 pp. $1.50, *net.*
Nation: "Few schoolmasters are so perfect in their art as to find no profit in the perusal of this rich offering of recorded experience, original suggestion, and independent criticism. . . . Not a page is dull or commonplace."

Pancoast's Standard English Poems.

xxiii+749 pp. 16mo. $1.50, *net.*

Lewis's Specimens of The Forms of Discourse.

Edited by Prof. E. H. LEWIS of the Lewis Institute, Chicago. viii + 367 pp. 16mo. 60c., *net.*

Alden's Art of Debate.

By Dr. R. M. ALDEN, University of Pa. xv + 279 pp. 16mo. (*Aug.*)

Buck & Woodbridge's Expository Writing.

By Dr. GERTRUDE BUCK and Dr. ELIZABETH WOODBRIDGE, both of Vassar. 292 pp. 12mo. $1.00, *net.*

Buck's Argumentative Writing.

206 pp. 12mo. 80c., *net.*

Selections from Landor's Imaginary Conversations.

Edited by Prof. A. G. NEWCOMER, of Stanford University (Cal.). lix + 166 pp. 16mo. 50c., *net.*

Tennyson's The Princess.

Edited, with introduction, notes, and analytic questions, by Prof. L. A. SHERMAN, University of Nebraska. lxi + 185 pp. 16mo. 60c., *net.*

Shakespeare's Macbeth.

Edited by Prof. L. A. SHERMAN. With questions for study and illustrations. xxvi+199 pp. 16mo. 60c., *net.*

Thackeray's English Humorists.

Edited by Prof. W. L. PHELPS of Yale. 400 pp. (*Aug.*)

Byron: Selections.

Edited by Dr. F. I. CARPENTER, University of Chicago. About viii+300 pp. 16mo. (*Sept.*)

Swift: Prose Selections.

Edited by Prof. F. C. PRESCOTT of Cornell. (*Sept.*)

French

Kastner and Atkins' Short History of French Literature.

By L. E. KASTNER of Cambridge (England) and H. G. ATKINS of the Royal Naval College. xvi+312 pp. 12mo. (*Sept.*)

Super's Histoire de France.

Adapted from *Ducoudray and Feillet.* By Prof. O. B. SUPER of Dickinson College. 210 pp. 16mo. (*Aug.*)

Kuhns' French Readings.

FOR BEGINNERS. Edited by Prof. OSCAR KUHNS of Wesleyan. With vocabulary. 310 pp. 70c., *net.*
Prof. Edward C. Armstrong of Johns Hopkins: "The texts are judiciously selected and graded, and are of a character to awaken and hold the interest of the pupils. I shall certainly give the Reader a trial at the earliest opportunity."

France's Le Crime de Sylvestre Bonnard,

MEMBRE DE L'INSTITUT. Edited by C. H. C. WRIGHT of Harvard. xviii+279 pp. 16mo. 80c., *net.*

Erckmann-Chatrian Contes Fantastiques.

Edited by Prof. F. S. JOYNES of South Carolina College. *With vocabulary.* xii+172 pp. 50c., *net.*

Lesage's Gil Blas.

SELECTIONS. Edited by Prof. W. U. VREELAND of Princeton. xxvii + 166 pp. 16mo. 60c., *net.*

Dumas' La Tulipe Noire.

Edited by Prof. E. S. LEWIS of Princeton. (*Sept.*)

Dumas' Monte Cristo.

Abridged and edited by Prof. E. E. BRANDON of Miami University. 280 pp. (Sept.)

LONGMANS' ENGLISH CLASSICS

(28 VOLUMES.) Edited by George Rice Carpenter, A.B., Professor of Rhetoric and English Composition in Columbia University.

This series is designed for use in schools in accordance with the system of study recommended and outlined by the National Committee of Ten, and in direct preparation for the uniform entrance requirements in English, now adopted by the principal American colleges and universities.
Each volume contains full Notes, Introductions, Bibliographies and other explanatory and illustrative matter. Crown 8vo.

New Volume.

Shakespeare's Julius Caesar. Edited, with introduction and notes, by George C. D. Odell, Ph.D., Tutor in Rhetoric and English Composition in Columbia University. With portrait. (Prescribed for the 1903, 1904 and 1905 Examinations.) Cloth, $0.50; boards, $0.40.

The following special features of the volume may be noted: (1) It throws emphasis throughout on the drama as a drama, rather than as a poem; (2) it is well adapted to introducing pupils to the systematic reading and study of Shakespeare; and (3) it is prepared by a scholar who has had ample experience in secondary teaching, as well as in the duties of a college examiner.

Study Books for 1901-1905 Examinations

Burke's Speech on Conciliation with America. Edited by Albert S. Cook, Ph.D., L.H.D., of Yale University. Cloth, $0.50; boards, $0.35.

Macaulay's Essays on Milton and Addison. Edited by James Greenleaf Croswell, A.B., Head Master of the Brearley School, New York. Cloth, $0.60; boards, $0.50.

Shakespeare's Macbeth. Edited by John Matthews Manley, Ph.D., of The University of Chicago. Cloth, $0.50; boards, $0.40.

Milton's Lycidas, Comus, L'Allegro, and Il Penseroso. Edited by William P. Trent, A.M., of the University of the South. Cloth, $0.60; boards, $0.50.

⁂ *A descriptive circular of the series sent to any address upon request.*

SOURCE BOOKS AND HISTORY

Selections from the Sources of English History: being a Supplement to Text-Books of English History, B. C. 55-A. D. 1832. Arranged and Edited by Charles W. Colby, M.A., Ph.D. Crown 8vo, 361 pages, $1.50.

"Something which the teacher of English history has long needed. I shall be very glad to use it in my own work."—Prof. BENJAMIN S. TERRY, *University of Chicago, Chicago, Ill.*

Liberty Documents. With Contemporary Exposition and Critical Comments drawn from Various Writers. Compiled and prepared by Miss Mabel Hill of the State Normal School, Lowell, Mass. Edited, with introduction, by Albert Bushnell Hart, Ph.D., of Harvard University. [*In the press.*]

England in the Nineteenth Century. By C. W. C. Oman, Fellow of All Souls' College, Oxford. With 5 Maps and Plans. Crown 8vo, $1.25.

". . . Those . . . who are fortunate enough to learn their history from it will never grumble over their lessons."—*Literary World, Boston.*

NEW TEACHERS' BOOKS

Historical Survey of Pre-Christian Education. By S. S. Laurie, A.M., LL.D., Professor of the Institutes and History of Education in the University of Edinburgh. Second Edition, Revised. 422 pages, crown 8vo, $2.00.

NOTE—*The attention of Teachers is invited to this cheaper edition of the above book; a circular, containing contents of the work and many extracts from letters expressing interest in the prospect of the new edition, will be sent on request.*

Training of the Young in Laws of Sex. By the Rev. Hon. Edward Lyttelton, M.A., Head Master of Haileybury College; Author of "Mothers and Sons," etc. Crown 8vo, $1.00.

"You deserve the thanks of parents and schoolmasters the world over for publishing this book."—JOHN MEIGS, *Prin. of The Hill School, Pottstown, Pa.*

LONGMANS, GREEN, & CO.,

The Nation.

NEW YORK, THURSDAY, AUGUST 30, 1900.

The Week.

The situation of the allies in Pekin recalls Napoleon's at Moscow, except that occupation was not had without fighting. The Imperial Government has fled to parts unknown, and no one has come forward to do homage to the victors or to negotiate for submission and indemnity. The continued presence of the legations has, therefore, a superfluous air, and that of the allied forces itself tends to become somewhat absurd, so long as China is content to get along without control of the imperial city. Our own part in the tragi-comedy is coming home to us forcibly, and all that can be said is, that we are trying to get out by not going deeper in. The diversion of troops from Taku to Manila points partly to this resolve of the Administration, but also to the essential weakness of our situation caused by the need of all the troops that can be spared to maintain our fighting strength in the Philippines.

As is to be expected, newspaper opinion on this subject, while generally agreeing that the policy of this country in the Chinese complication has been wise, shows considerable divergence as to the course which should now be pursued. The Washington *Post* and the Philadelphia *Times*, for example, insist that the troops should be recalled at once, as soon as the rescue of the legations has been accomplished, while the Philadelphia *Ledger* declares that the President "should use as much diligence in getting all Americans, civil and military, out of China, as he exhibited in providing for the relief of Pekin." On the other hand, the Boston *Journal* bluntly affirms that "American soldiers are in China for more than the mere march to Pekin," and the Cleveland *Leader* insists that the troops "must be left where they are until a satisfactory settlement has been arrived at." It is generally assumed that the United States cannot stay its hand until it has obtained satisfactory guarantees of indemnity and future peace, but there is practical accord in wishing to see this result accomplished with as little international complication as possible, and with scrupulous regard for our own declarations. We are glad to see that the notion of a permanent military occupation of China, or the acquisition of territory in that part of the world, meets with no favor in the press of either party.

The race riot at Akron, O., last week was in some respects the most significant and disquieting of the many such occurrences in various parts of the country during the last few years. Akron is neither a town in a "black belt" of the South, nor a great city in the North. It is situated in the northeastern part of Ohio, is the county seat of Summit County, and so recently as 1890 had less than 28,000 inhabitants. It is in that Western Reserve region which was largely settled from New England, and, until the rise of manufacturing industries, was the old-fashioned shire town of a rural county. Even despite the modification which its population has undergone during the past quarter of a century, in which it has grown from about 10,000 to about 40,000 people, it must still have a strong leaven of the old spirit which gave to the district a distinctive and elevated tone. The negro element in the population is very small. In 1890 there were only 451 blacks in a total of 27,601 (the 27,601st being a Chinaman). In other words, the colored contingent was only 2 per cent. as large as the white ten years ago, and there is no reason to suppose that it has gained materially since 1890. The crime which provoked the riot was one which often arouses a community to a high pitch of excitement when the criminal is a white man, but the fury of the Akron mob was plainly aggravated by the fact that the offender was a black man and his victim a white girl. When it was at last proved that the particular black man sought had been spirited away by the officers beforehand, cries arose, "Lynch any nigger," "Get a nigger outside," and the only safety for any colored person was to keep indoors. The destruction of the City Hall by dynamite followed. The police did not strike hands with the mob, as in this city the other day, but were miserably impotent. A Texan town meeting has passed a satirical resolution on the barbarism of this outbreak, but it is clear to any candid observer that wherever such crimes are perpetrated and tolerated by the community, the publicity now given to them makes them contagious over all the land. The South must share the shame with Akron.

The melancholy condition of apathy which causes so much concern to Senator Hanna is likely to be ended if Mr. Bryan keeps on talking as plainly as he did on August 16. He took hold of one of the most cherished of the Republican scarecrows—the awful sacrilege of hauling down "Old Glory"—and showed up its composition very happily. He pointed out that the Administration is now engaged in hauling down the flag in Alaska, for the very good reason that it was flying over territory that did not belong to us. He asked whether the fact that the flag had been raised over Pekin compelled us to maintain an army permanently there to keep it from being hauled down. And he inquired particularly as to the matter of hauling down the flag in Cuba. Is President McKinley going to haul down our flag when the Cubans set up a government, or not? If he is not going to haul it down, what is the meaning of our talk of Cuban freedom and independence? If he is going to haul it down, what does he mean by talking as if the act were sacrilege? On this subject Mr. Bryan has scored a distinct advantage. He has offered the Republican orators a dilemma, from which they can escape only after the manner of the cuttlefish. They have formed the habit of uttering a large quantity of cant and bombast and platitude, and passing it off on patient audiences with the idea that it would be received as profound wisdom. Now they have to deal with an orator who is not afraid to expose their sham patriotism, and who makes their most exalted and impressive appeals ridiculous. Mr. Bryan is vulnerable enough himself, but his adversaries are vulnerable on the subjects which most interest the public, and, in spite of their protests and evasions, he seems likely to keep them on the defensive.

Mr. Bryan did not confine himself to ridiculing the Republicans, but laid down some sound and true doctrine concerning Imperialism in general, and its results in the Philippines in particular. Imperialism, he declared, is the doctrine of the bully and the coward. The spirit that carried us into the Philippine Islands will lead us wherever we can find a people weak enough to be conquered. He took the position, clearly and definitely, that we have no title to the Philippine Islands, according to the Declaration of Independence. We cannot buy people. It is better to have two flags, representing two republics, than one republic representing an empire; and when the American flag comes down in the Philippine Islands, it will be replaced by the flag of a republic established by their inhabitants. This bold and aggressive attitude will be likely to win over many doubtful voters to Mr. Bryan's support. It appeals to the sentiments of justice and generosity in mankind, and such sentiments are very powerful political forces when they can be aroused. To meet these appeals the Republicans are miserably equipped. So far as justice is concerned, all that they can plead is that we paid Spain twenty millions of dollars for her title to the Philippines, at the end of a war waged on the ground that her colonial government was so bad as to annul her title to Cuba. On the score of generosity, the best that the Republicans can say is that our Government has killed a large number of Filipinos in order to impart civilization to the survivors.

The Republican State Convention in Washington week before last showed how little foundation there is for the confidence which Bryan expressed in a Nebraska speech, the other day, that nobody who voted for him on the issues of 1896 has changed his mind on those issues. Four years ago the silver sentiment was so strong in Washington that 112 out of 402 delegates favored putting a free-coinage plank in the platform, and, when election day came, Bryan swept the State for "16 to 1" by a plurality of 12,500. In the late convention not a voice was raised in favor of free coinage; satisfaction was expressed that "the Democratic heresy of free silver has been put to sleep by a Republican Congress," and the party pointed with pride to the fact that "the gold standard has been reaffirmed in the most positive and satisfactory manner." Washington is thus in line with its neighbor, Oregon, where in 1896 a majority of the Republican State Convention voted against putting a declaration opposing free coinage in the platform, and adopted instead a "straddle," while this year it was declared that "the maintenance of the gold standard is the most important political issue." Such proofs of returning sanity are most welcome.

Secretary Gage's interview, published on Monday, telling what a Secretary of the Treasury could do if he desired to put the country off the gold standard, will command the attention of the country. It ought to bring out a reply from Mr. Bryan, but he happens to be sitting between two stools. If he should say that a Secretary appointed by himself could not, or would not, upset the gold standard, then he would place himself in opposition to the bulk of his own party and to the logic of his own platform. If he should say that his Secretary of the Treasury could and would use all the means at his command to promote bimetallism at the ratio of 16 to 1, "without waiting for the aid or consent of any other nation," then he would repel many votes which he might otherwise receive from the Gold Democrats and Independents. It is probable, therefore, that he will continue to say nothing on the subject, and that Secretary Gage will be without an opponent.

Mr. Gage's first contention is that Mr. Bryan could order his Secretary to make payments in silver of all the public debt *that is payable in "coin" and for all current disbursements of the Government*. He points out, however, that a practical difficulty would be found in the fact that the Government has only $16,000,000 of silver dollars of its own on hand, all the rest of them belonging to the holders of silver certificates now in circulation. The paying out of $16,000,000 in silver would be an inconvenience both to the Government officers who should handle them, and to the persons required to accept them, but the latter would find ways to use them, as Mr. Gage observes, at the custom-houses and the internal-revenue offices. One of the practical consequences which should not be overlooked would be the establishment of a premium on gold equal to the cost of handling the silver dollars. Sixteen million cart-wheel dollars will not cart themselves. Force must be applied and cost incurred, and the freight bill must be paid out of the freight. Sixteen million silver dollars weigh upwards of five hundred tons. We do not see how a premium on gold could be avoided under such circumstances. But a premium on gold, however slight or however incurred, would have a very disturbing effect on the public imagination. Very few persons would understand the causes of it. Most people would interpret it by their fears, and the consequences might be disastrous. The probability is that if Mr. Bryan should give the kind of order that Mr. Gage prefigures, he would be compelled by public opinion to rescind it the next day.

Gov. Roosevelt has given another characteristic illustration of the ease with which he can surrender his convictions upon the demand of "the organization." He knows that Odell has been, throughout his Governorship, the representative at Albany of the Platt machine, and as such the chief foe of the measures which he had most at heart; he knows that it was because the machine wanted its own representative in the Executive Chamber that it insisted upon pushing Roosevelt out of the Governorship by nominating him for Vice-President, and that Odell was an active agent in this scheme; he knows that a recognized machine man is most offensive to the independent voters of the State, and consequently that the nomination of Odell involves a risk of defeat which there is no excuse for running. For these reasons the Governor must have been at heart opposed to the nomination of Odell, and for a while he gave the impression that he was doing his duty in trying to prevent it. But the organization having triumphed, Roosevelt now comes out with a glowing eulogy of Odell and a declaration that he is "heartily for him," as a man who "will make an excellent Governor." Platt must take an infinite deal of satisfaction in the ease with which he converts the Rough Rider into a steady-going hack whenever the occasion arises.

It is not without interest, in connection with the proposed extradition of Neely to the Cuban authorities, to recall the views of Gen. Wood, now Military Governor of Cuba, concerning the expediency of subjecting American citizens to the jurisdiction of his "civil courts." They were expressed in a special report made last October, and are as follows:

> "Under the existing condition of things in Cuba no means are provided for the trial of . . . civilian employees of the military establishment, for offences not cognizable under the articles of war, *except the Cuban courts*. . . . I do not believe that it is wise or prudent or in any way desirable to subject American citizens, who are in the service of their own Government, to the jurisdiction and capricious decisions of tribunals composed of persons *alien in race and sentiment, administering a system of laws with which Americans are entirely unfamiliar, and which would not be tolerated in any American community.*"

It is worth while to remember, also, that when the extradition act was passed in order to subject American citizens to the jurisdiction described by Gen. Wood, the Judiciary Committee of the Senate proposed an amendment providing that before the Judge of a court of the United States should order the extradition of any one, he must be satisfied "that proper provision exists for securing to the accused a speedy and fair trial for such offence, where he will be informed of the nature and cause of the accusation, and be confronted with the witnesses against him, and have compulsory process for obtaining witnesses in his favor, and have the assistance of counsel for his defence." Congress rejected this amendment, and provided merely that the Cuban authorities should "guarantee" to the accused person a fair and impartial trial. These circumstances show how easy it is to lose Constitutional rights which have been gained by long and painful struggles.

A correspondent asks us to explain what is the present government of Porto Rico. It consists of a Governor appointed by the President of the United States, an Executive Council of eleven members, six of whom are appointed by the President of the United States and five elected by the people of Porto Rico, and a House of Delegates of thirty-five members elected by the people. All administrative offices are held by the members of the Executive Council, and all franchises, charters, and privileges are granted by the Council, with the approval of the Governor, but may be disapproved by the Congress of the United States. It appears, therefore, that the government of Porto Rico is really in the hands of the President of the United States, who appoints the Governor and a majority of the Executive Council. The persons composing the present Government of the island are both honest and capable. They would be better fitted for their task, indeed, if they could speak the language of the country they govern, but, aside from this, they are undoubtedly fit for their places. The only objection to them is that they do not represent the principles of self-government. When they were appointed, the President was under strong compulsion to make good selections.

The eyes of all Americans were then fixed upon Porto Rico as an orphan suffering bad treatment. Who is to answer for the next appointees? In whose hands will the appointing power be when the time comes for a change? In proportion as the public mind is turned away from Porto Rico and fixed on other things, so will politicians of the Rathbone and Neely type see their opportunity. The spur to good government will be withdrawn, and the danger of bad appointments increase. Who is to guarantee the application of civil-service reform to Porto Rico or the Philippines when political parties are clamoring for its abolishment at home? The more we contemplate Uncle Sam in the light of a guardian angel to foreigners, the more incongruous is the spectacle he presents and the more melancholy the prospect of his wards. The intentions of the people of the United States have nothing to do with the question. Government is not carried on by intentions, but by instruments. The question is not what your intentions are towards Porto Rico or any other colony, but who and what your instruments are and by what rule you select them.

It now appears certain that Sir Wilfrid Laurier's Liberal Ministry will go before the Canadian electors in October. The dissolution of the Liberal House of Commons nearly a year in advance of the natural term is virtually an appeal to the country for a vote of confidence. Already it is possible to trace the main issues of the impending campaign. The Liberals in Canada would be Conservatives in England, and so, conversely, the Canadian Conservatives would be Liberals in England. So far as any principle is at stake, it is conflict between the Imperial policy of Sir Wilfrid Laurier, the Liberal leader, and the Canadian policy of Sir Charles Tupper, the Conservative leader. The issue is, however, by no means sharply drawn, for the Liberals must keep Imperialism in the background in French Canada, while the Conservatives must manage to be pro-Canadian without incurring the reproach of being Anti-Imperial. The Laurier Administration has been so essentially Opportunist—this quite naturally, when the complication of race and party interests in Canada is considered—that it is as difficult for the Opposition to deliver a decent frontal attack as it is for Mr. Campbell-Bannerman's forces to engage Lord Salisbury's at Westminster.

Accordingly we find the opposition conducted along many lines. The Conservatives charge Sir Wilfrid with giving Great Britain a substantial preferential in the customs without the *quid pro quo* which Canadians might and should have had at the English customs. Generally, they assert, in the past four years Canadian interests have been sacrificed to Imperial. Similarly, they allege that the Liberals have made valuable concessions to the United States, in admitting corn free particularly, without a return in kind. Other charges of maladministration abound. The Minister of the Interior is taxed with having administered the immigration laws with reprehensible laxness, and the Minister of Public Works with making shady contracts and carrying his anti-English utterances almost to disloyalty. Scandals in the building of highways and subsidizing of railroads are also alleged. The parties meet squarely at one point—the administration of Dominion finances. The Conservatives point to an increasing expenditure, from the $41,702,383 of the last Conservative Government to an estimated $53,050,000 for the fiscal year ending June 30, 1900, and insist that this neither represents work done of a permanent character, nor the normal growth of Dominion needs, but the reckless extravagance of the Laurier Administration. This, it appears, is the immediate issue of the coming electoral campaign.

The attempt of Mr. Chamberlain to make a grave matter of some letters written by an Englishman to Boer correspondents and recently captured at Pretoria, seems to be a dismal failure. It is similar to the attempt made in this country to prove Senator Hoar and Mr. Atkinson guilty of treason because they opposed killing the Filipinos in the name of civilization and Christianity. Mr. Chamberlain injudiciously asked Mr. Labouchere if he had any explanation to offer of his letters, which were among those captured, to which that vivacious gentleman replied that he was responsible for his acts to the House of Commons, to his constituents, and to the law; and that to Mr. Chamberlain he owed no sort of explanation. He added that if explanations were to be offered, Mr. Chamberlain had an excellent opportunity to make some concerning his action in South Africa, which would receive due consideration. He ended by printing his own letter and forcing the Government to print the rest.

The renewed collapse of prices on the German stock markets this week is perhaps partly due to the apprehension of complications in China, but is probably caused in a great measure by the law against "time contracts." This law is essentially the same as the "anti-option" law proposed in this country by the Populists, which shows that Populism and despotism are very similar. During the civil war, when our Government had ruined its credit by emitting vast quantities of notes which it did not pay, gold became a speculative commodity, and often commanded a high premium in greenbacks. In order to repress the speculators, who were accused of making money out of the distress of their country, Congress passed an act prohibiting dealings in gold. The immediate result was that gold shot up to such a figure that Congress was compelled to repeal the act with precipitate haste. The German act was meant to prevent speculating in stocks on margins, and dealings in futures; and in order to accomplish that result, it put a premium on fraud and dishonesty. No one who bought "futures" was obliged to pay for them, and bankers who trusted to the honor of their clients were in some cases very heavy losers. Under such circumstances prices cannot be supported. If any one wishes to sell a quantity of stock, he may find that no one happens to have the cash to buy, and sales may have to be made for prices far below actual values. When speculation, as it is called, is not meddled with by Government, there are always many people on the lookout for bargains, and their competition keeps prices somewhere near their normal level. There seems to be no lack of productive and commercial activity in Germany, and the paternal benevolence of the Government is apparently the chief cause of the financial disturbances which it undertook to prevent by its meddlesome legislation.

Shortly after the death of Humbert, Queen Margherita composed a rosary, with prayers for her husband's soul, and presented it to the Bishop of Cremona for official sanction. This was kindly granted for the diocese in which the King died, and it is probable that thousands of pious Catholics prayed, in the Queen's words, that God would be gracious to the soul of the dead King. But the Pope intervened, and forbade the use of the prayer either in private devotions or in churches. Technically the Pope was right. Humbert, in the Church's eyes, was a usurper, who died in contumacy against the Pope's authority. It was unseemly, to ecclesiastical thinking, that his virtues or his memory should be celebrated in Roman Catholic churches, or even that his soul should receive any comfort from the mediatory offices of the Church. This may have been good religion; it was very bad politics. The discourtesy of the act has rallied public sentiment in Italy to the side of the widowed Queen and her son, and for the moment, in the long sullen fight between the Vatican and the Quirinal, the Vatican loses.

MR. BRYAN AT TOPEKA.

Being forced to accept the nomination of the Populists, Mr. Bryan has been compelled to show that he agrees with them generally, that he stands on their platform, and that he is one of them in all respects except in name. This service he rendered in Topeka on Thursday, but he did so in very cautious terms. It was the first occasion on which he has been compelled to advocate any principles other than that of opposition to the Imperialist policy of Mr. McKinley, and it is evident that he would have been glad to be excused, since he gave one-half of his time to the discussion of Imperialism, and declared that he considered it the most important question now before the people.

The Populists have been known to us heretofore as the party which believes that the Government can make money out of nothing by merely putting its stamp on a piece of paper, and that its volume should be increased "to an amount sufficient to meet the demands of the business and population, and to restore the just level of prices of labor and production." As an incident and adjunct to that monetary system, the Populists demand the free coinage of silver at the ratio of 16 to 1, but they do not consider the redemption of the Government's paper money in either silver or gold necessary or desirable. They think that the Government ought to own and operate all the railroad and telegraph lines, and that laws should be made by direct vote of the people, and that all public salaries should be made to correspond to the price of labor and its products. These are only a part of the vagaries which they hold, and which they expect Mr. Bryan to help them put in force if he is elected President of the United States.

Mr. Bryan does not say explicitly whether he concurs in the Populist doctrine that redemption of paper money in any kind of coin is necessary, or not, but he says that the Democratic party does not agree with that view, from which the inference must be drawn that he does not agree with it. What he says on this important point is embraced in the following paragraphs:

> "In 1896 the reform forces charged the Republican party with intending to retire the greenbacks. This charge, denied at the time, has been confessed by the Financial Bill, which converts greenbacks, when once redeemed, into gold certificates, and extends new privileges to banks of issue. If a Populist opposed the Republican party when its hostility to greenbacks was only suspected, that opposition should be greater now, since no one can longer doubt the purpose of the Republican party to substitute banknotes for greenbacks
>
> "It is true that the Populists believe in an irredeemable greenback, while the Democrats believe in a greenback redeemable in coin, but the vital question at this time, so far as paper money is concerned, is whether the Government or banks shall issue it. There will be time enough to discuss the redeemability of the greenback when the greenback itself is saved from the annihilation which now threatens it."

The charge here made against the Republican party of an intention to retire the greenbacks and to substitute banknotes for them is not true. We are among those who wish that it were true. The greenback is the one thing at the present time that blocks the road to a sound monetary system. It is the one thing that keeps the Government in the banking business, where it ought never to have been, and where it ought not to remain a day longer than necessary. That the Republicans are far from any thought of retiring and abolishing the greenbacks is proved by the fact that no such proposition was brought forward in either the House or the Senate at the last session, nor was that policy advocated by any Republican on either floor of Congress. Mr. Bryan did, however, make a point when he charged that "the Republican party is now committed to a currency system which necessitates a perpetual debt." This refers to the debt-refunding clause of the Currency Act, which substitutes bonds running thirty years in exchange for those which mature within eight years, and which might be paid off if the Government were so disposed.

Now let us see upon what points Mr. Bryan does agree with the Populists. In the first place, he agrees with them as to the free coinage of silver, although he buries this issue under as many words as possible. He says that

> "If an increase in the volume of the currency since 1896, although unpromised by the Republicans and unexpected, has brought improvement in industrial conditions, this improvement, instead of answering the arguments put forth in favor of bimetallism, only confirms the contention of those who insisted that more money would make better times."

And again:

> "If the Populists felt justified in opposing the Republican party when it sought to conceal its gold-standard tendencies under the mask of international bimetallism, the opposition should be more pronounced in proportion as the Republican party more openly espouses gold monometallism."

These oracular sayings must have puzzled his Populist hearers when they recalled the "cross of gold and crown of thorns," and the other stunning phrases of 1896. It is very plain that Mr. Bryan at Topeka sought to say just enough on this subject to hold the Populist vote, but not enough to offend the Gold Democrats.

On the other points of Populist doctrine, such as "government by injunction," direct legislation, the control of railroads and of Trusts, Mr. Bryan declared himself in general accord with the Populist platform; but in each case his language was guarded and qualified so as to give the least offence to conservative citizens. The speech was carefully prepared, and in a literary point of view was unexceptionable. The concluding portion, on the cost and meaning of standing armies, is very strong, and it is to be hoped that it made an impression on the Populist hearers, who have not hitherto given signs of much interest in Imperialism or much objection to war in the Philippines or elsewhere.

SENATOR HANNA ON PROSPERITY.

Senator Hanna's speech at Asbury Park on Tuesday evening of last week was delivered four or five years too late to have any important effect on national politics. At the time when Mr. Cleveland and Secretary Carlisle were struggling to ward off the consequences of the Republican legislation of 1890, and to preserve the gold standard, people were ready to believe that the financial disasters of the period were due to the Administration then in power. Since that time, however, the public have had leisure to examine the facts without passion or prejudice. The light of history has been thrown upon the financial crisis of 1893 and the subsequent years. The genesis of those troubles is now pretty well understood, and the facts are quite different from the picture drawn by Mr. Hanna in the following words:

> "I want to point out to you an object-lesson. Go back to the midst of the prosperity and happiness that prevailed in 1892. Then furnaces were blazing, spindles were spinning, business was hurrying us back and forth. You wanted a change and you got it. Well, what was it? I need not picture how fires went out in the furnaces, how spindles failed to spin, how unemployed men went hungry, how happiness disappeared, how bad went to worse. It was deplorable. Well, you wanted another change, and you got it. What a change! Furnaces are glowing, spindles are singing their song. Happiness came to us all with prosperity. Do you want another change to get back to '93-97? Of course you don't. Well, you must work to prevent it."

To understand the business situation in 1892 we must glance at that of the first Cleveland Administration, which began in 1885 and ended in 1889. It will be remembered as a period of good times—not a boom, but not hard, dragging times such as we have frequently seen since. One fact stands out with great clearness, and that is the surplus in the Treasury. Mr. Fairchild was then the Secretary, and he was all the time at his wit's end to dispose of the money coming in, so that the loan market might not be cramped by the intake of the Treasury. The purchase of bonds had been so rapid that the price of the 4s had been run up to nearly 130, which was quite unprecedented at that time. The Secretary had deposited about $80,000,000 in national banks, and this fact was made use of by Mr. Blaine as the basis of a charge of favoritism to particular banks, which was as groundless as the similar charge preferred against Secretary Gage a few months ago.

The central fact of the financial situation during the past twenty years has been the redeemability of the Government's legal-tender notes in gold. Everything has depended upon this. Private solvency has hinged upon Government solvency, as it does to-day. The prosperity of every man's business has been conditioned on the Government's ability to meet the daily drafts upon it, of which the redemption of its demand notes was the most important of all. The surplus for the single year 1888 reached the enormous sum of $119,000,000, and the redemptions of the public debt during the four years of Mr. Cleveland's first term were $235,000,000 in excess of the annual sinking fund, which was nearly as much more.

The Republicans came into power in 1889, and soon made havoc of the surplus. Two bills were immediately introduced having this object in view, and a third was brought forward later. One of these was the McKinley Tariff. It contained a clause repealing the duties on sugar, which struck out $55,900,000 of revenue at one blow—that is, about one-half of the annual surplus. The second was a new pension bill, which eventually added $50,000,000 to the expenditures, and which led Corporal Tanner, who was then Commissioner of Pensions, to exclaim, "God help the surplus." The third bill, which came later, was the Sherman Silver Act, the worst of the three in its effects upon private business and upon the Treasury as well.

The Bland-Allison Silver Bill had been in operation since February, 1878, calling for an expenditure of about $25,000,000 per year for silver bullion to be coined into silver dollars—a species of fiat money which was kept at par by a roundabout process of redemption. The Government which paid them out took them back at the custom-house and the tax office, so that anybody could realize par for them by paying them to the Government. Obviously this condition could last only as long as the amount outstanding was no larger than the Government could take in for taxes. The public understood the situation perfectly.

The Sherman Silver Act proposed to increase the purchases of silver bullion from $2,000,000 worth per month to 4,500,000 ounces per month, and to issue a new kind of fiat money on it—a kind that did not need to be coined, and could, therefore, be put out faster than silver dollars. This law was passed in July, 1890. It added to the public expenses about $50,000,000 per year, and not only ran the Treasury in debt for current expenses, but created an apprehension in the public mind that we were within measurable distance of a suspension of gold payments.

The Treasury surplus began to grow less until it disappeared altogether. The gold reserve began to shrink. Secretary Foster, in the latter part of 1892, began to talk about issuing bonds to replenish the reserve, and actually gave an order for the preparation of plates for printing the bonds. Mr. Dolliver of Iowa, the same who has just been appointed Senator from Iowa, was interviewed on the financial situation about the middle of January, 1893, to the following purport:

> "The Treasury is in no *present* danger. It will pay gold on demand for every piece of silver or paper outstanding as long as we [the Republicans] are in power. To be sure, the percentage of gold on hand is not as great as it has been, but it is sufficient. The people won't call for it; the paper currency is good enough for them. *What may happen after the 4th of March is not our affair.* There is no reason why we should go out of our way to help the Democrats. Let each party look out for its own troubles. That is my present view. However, I reserve the right to change it later."

Mr. Dolliver's diagnosis of the situation, both political and financial, in the middle of January, 1893, was correct. It was also frank. It was an acknowledgment that if a panic was approaching, it would not be the work of the incoming Administration, although the latter would have to bear the burden of it. The panic came a few months later. It was caused by the three profligate and disastrous measures enacted by a Republican Congress here enumerated; and now Senator Hanna has the effrontery to point back to the hard times of 1893-97 as though they had been caused by the Administration which suffered from them.

THE NEELY CASE.

Charles F. W. Neely was, until recently, an American citizen enjoying an apparently deserved obscurity. Such reputation as he had was none of the best, and his achievements in Cuba have not been of a description to bring honor either to himself or to his country. So far as he is personally concerned, his countrymen would regard his departure to Cuba, or to any country outside the United States, and his incarceration there, with great complacency. Mr. Neely, however, is likely to find himself in the category of those who have greatness thrust upon them. Judge Wallace ruefully observes that he has had to travel 300 miles, at considerable inconvenience, in order to accord him his rights. His case will occupy a prominent place hereafter in the annals of our jurisprudence, and his name will be often on the lips of lawyers, of judges, and of statesmen. The reasons for this are perhaps not clearly understood by the public; but they are obviously of sufficient importance to make it desirable that they should be known. This is abundantly established by the fact that in Neely's petition for a writ of habeas corpus his attorney has sworn that he is informed (and believes) that the United States Government authorities have made arrangements for the placing of the petitioner on board a vessel for immediate transportation to Cuba as soon as possible after an order for extradition has been made, under such circumstances as will prevent, and are intended to prevent, the petitioner from applying then for a writ of habeas corpus. If this allegation is established, the guilt or the punishment of Neely becomes insignificant; the rights of every American citizen are the real matter at issue.

Stated as concisely as possible, the facts in the case are as follows: Neely, who stands accused of stealing from one of the departments of the anomalous government now existing in Cuba in which he was employed, came to the United States. He was arrested and imprisoned in the Ludlow Street jail in New York, in an action which could probably not be sustained. In order to insure his punishment, Congress on June 6, 1900, passed an act providing for his extradition to the Cuban authorities. On June 27, on two complaints of the United States Attorney under this statute, Circuit Judge Lacombe issued two warrants for Neely's arrest. The United States Marshal took him into custody, exhibiting the warrants as his authority, and on June 29 brought him before Judge Lacombe, when the United States Attorney demanded his extradition under the complaints. The proceedings were adjourned, and on July 24 Judge Lacombe endorsed on the warrants the words "Remanded till decision," under his signature and official title.

Thereafter Judge Lacombe filed an opinion to the effect that Neely should be held for extradition, and stating that he would sign an order so soon as the other proceedings were discontinued. Neely's petition for habeas corpus recited these facts, and by no other proceeding could he have obtained a review of Judge Lacombe's decision. Judge Lacombe suggested that the petition be presented to some other judge than himself, and it was presented to Judge Wallace on August 9. He denied the petition, but allowed an appeal, and made an order directing the marshal to hold Neely in custody pending the appeal. He has now denied a motion to vacate this order, based on the theory that Neely was not in the custody of the marshal when the writ of habeas corpus was applied for. In support of this theory, the marshal made what can hardly be characterized otherwise than as an incorrect return, by endorsing on the warrants, on August 13, a certificate that he had not detained Neely by virtue of the warrants. Judge Lacombe says that he made no order committing Neely under the statute; but he endorsed the warrants as above set forth. As Judge Wallace says, unless Neely was actually or constructively in custody under those warrants, Judge Lacombe had no authority to entertain the proceedings. "Until the warrants were issued and served, the whole proceeding was in the air, and notwithstanding the prisoner may have been held and the witnesses were examined, all that took place was a solemn farce." If he was present merely because the marshal brought him there under process in some other proceedings, Judge Wallace continues, Judge Lacombe "was merely holding a moot court, and his pronouncement would have had no more effect as a legal decision than if it had been made by the United States Attorney, or even by a bootblack upon the corner of the street." Neely must have been in custody in the extradition proceeding, because that was the very foundation of the jurisdiction of the judge to hear and determine the case. The theory that a person may be tried on a criminal charge without being arrested may prevail in France, but it has no place in our jurisprudence.

Judge Wallace, it is to be observed, holds the extradition statute Constitutional; but that question remains to be decided. The rights involved are of transcendent importance, and are similar to those defended by the Supreme Court in the Milligan case in 1865. Milligan was a more odious person than Neely, and was very likely guilty of treason; but the court did not allow its detestation of his character or his offence to affect its judgment. Milligan was tried by a military commission in Indiana, a State where the civil government was in undisturbed operation, and was sentenced to be hanged. He was not in the military or naval service of the United States, and had not resided in any of the States in rebellion, but had been a citizen of Indiana for twenty years. The Supreme Court granted a writ of habeas corpus, saying that it was the birthright of every American citizen, when charged with crime, to be tried and punished according to law. He can be held to answer for an infamous crime only on presentment by a grand jury; he can be tried only by jury; he must be informed of the accusation and be confronted by the witnesses against him; he must have compulsory process for obtaining witnesses in his favor, and have the aid of counsel for his defence. The Supreme Court held, in an opinion which might well be studied in these days of peril to the Constitution, that an American citizen could not be tried by a military commission, deriving its authority from the President as Commander-in-Chief of the army, and sitting in a peaceful community on the assumption that it is the theatre of active military operations.

Neely is not in the military or naval service of the United States. Peace prevails in Cuba. Yet the whole government of Cuba is military, and its Military Governor is its supreme executive, legislative, and judicial authority. He has ordained a code of laws, and he can repeal it to-morrow. He has set up what are called "civil" courts, and by his fiat he can terminate their existence to-day. These courts are not constituted by the people of Cuba—that "free and independent" people recognized by Congress more than two years ago. They do not *derive their authority from Spain or from our Congress.* They are military courts, no matter what they are called.

A subordinate officer in our army in Cuba is now authorized to call upon his Commander-in-Chief to seize American citizens and send them to be tried and punished in Cuba by this subordinate officer at his discretion. Our army is occupying a friendly foreign country, whose freedom and independence we have recognized, where profound peace prevails, but where no civil government exists because the assertion of our military power forbids. This power is usurping the sovereignty of the Cuban people; it has no justification under the Constitution of the United States; it makes no pretence of respecting the Constitutional provisions for the rights of American citizens; and yet it is proposed to send American citizens to Cuba to be disposed of according to the arbitrary direction of an officer of the army who exercises this despotic and anomalous jurisdiction. We can imagine no better illustration than this of the real tendencies of Imperialism; and when the evidence is presented showing the arrangements planned by our military authorities for hurrying Neely off to Cuba the moment that an order for his extradition was signed, the American people may begin to feel that the danger to which they are exposed is not exaggerated.

THE HUNTING OF THE TRUST.

The intense hostility to Trusts manifested in all our party platforms, and displayed by all our politicians, has not yet put an end to these monsters. On the contrary, they appear to flourish like the green bay tree, and to multiply like the seed of Abraham. In this part of the country, and perhaps in some others, the wiles of these insidious "combines" have been too much even for some of the guardians of the public. A French Deputy was once describing to his constituents the demoralizing influences which affected the Chamber, and exclaimed: "In fact, so intense and all-pervading was the corruption which prevailed that even I, who address you, did not altogether escape contamination." Such appears to be the plight of a number of our leading local statesmen. Any ordinary temptation to dishonesty, any moderate inducement to blackmail, any small bribe, their virtue might be sufficient to resist. But when our vast modern aggregations of capital descend on our legislators like Zeus upon Danaë, they are irresistible. The average politician does not lay claim to superhuman integrity; but, to do him justice, in the very moment of yielding he cries out against the wickedness of the tempter. Satan may get him; but as he is carried off, he will kick, and denounce the methods of the evil one.

There is some reason to believe that the condition of affairs in the State of Texas is somewhat better than this. The hostility to Trusts there appears to be unusually stern and uncompromising. At all events the Texas Legislature passed a law against Trusts which has actually proved to be Constitutional, and which looks extremely drastic. In fact, it is difficult to see how any business can be transacted without violating this statute, and of course the Trusts are comprehended under these broad provisions against agreements of sale of all kinds. At all events, an oil company, said to be controlled by the arch-demon, the Standard Oil Trust, was caught red-handed, selling oil in Texas, and, in spite of its protests and denials and squirmings, the penalty of the statute was applied. The criminal corporation, which drew its guilty life from the State of Missouri, and was doing business in Texas under a license, had its license revoked, and was perpetually enjoined from continuing its nefarious transactions in that State. The struggles of the octopus were desperate. Every court in Texas was resorted to, and at last the Supreme Court of the United States was reached. It was all in vain. A Texas ex-Judge, named McFall, says that the wicked corporation laughed a laugh of defiance at Texas when it reached that haven of foreign corporations, the Federal Court; but it did not laugh long, for the Supreme Court decided against its appeal. The majesty of the law was sustained; the triumph of the State of Texas was complete.

Alas, that triumph was of short duration. The fair fruits of victory turned to ashes in the mouths of the representatives of the State. About five minutes after the license of the criminal corporation had been revoked, and it had been thrust from the State with the mark of Cain branded on its brow, another corporation, having the same name, hailing from the same jurisdiction, having some of the same members, and having purchased all the property of the ejected corporation, applied for a license to do business in the State of Texas, and got it. We need not say that this outrageous and entirely legal proceeding aroused the most furious indignation among the Anti-Trust politicians. Judge McFall voices their wrath. His sincerity cannot be doubted, since he has tendered his services to the Governor, free of charge, in the work of vindicating the law. He intimates that some of the officials of the State had "negotiated" with the attorney of the oil company, and there are suggestions of the use of champagne and cigars on a private car. Impartial justice compels us to say that the said attorney denies the champagne and private-car charge, and pleads that if any cigars were employed, they were of the three-for-a-quarter kind. In this jurisdiction such a plea would of course establish a complete defence. Our courts would take judicial cognizance of the results of offering any politician of influence cigars of that description, and would at once give judgment for the defendant. Whatever opinion they might entertain of the wisdom of an attorney against whom such charges were brought, they would instantly acquit him of all suspicion of the guilt of embracery. But it is quite possible that different standards prevail in Texas, and Judge McFall is no doubt justified in inquiring into the cigar episode with the utmost thoroughness.

Leaving that matter aside, Judge McFall tackles the main problem with vigor. He impressively observes that laws are enacted with the expectation that they are to be enforced, and that those who break them will be punished, "otherwise it were mere mockery and waste of time to enact them," and very justly adds that in this case the Anti-Trust Law does not appear to have been vindicated in the slightest degree. With equal propriety he remarks that "we, as Democrats," have no right to accuse the Republicans of insincerity in their attitude towards Trusts, when the most drastic laws that Texas can frame prove a delusion and a snare. The conclusions appear to us irresistible, and are so eloquently urged as to deserve to be given in Judge McFall's own words: "What standing has the Democracy before the people when her greatest statesmen condemn in matchless oratory on stump and in forum the doings of the Trust, and appear, as soon as one is caught and convicted, as special champions to stay the just judgment of the courts?" We fear that unscrupulous Republicans may pervert this utterance for campaign purposes; but we cannot help it. The truth must be told. *Fiat justitia, ruat cœlum.*

The attorney for the oil company shows the cold callousness to be expected in one occupying his position. Instead of eloquence, he confines himself to law, and resorts to common sense instead of political appeals. He asks some pertinent questions, which may well be considered by all sincere Trust-hunters. Does a judgment of forfeiture against a foreign corporation prevent its stockholders from abandoning it and organizing a new one? Does it prevent some of them from purchasing the shares of the others, and from purchasing the property of the defunct corporation? Does it prevent entire strangers from organizing a corporation to transact the same business as the defunct company? Does it destroy the property of the old corporation? Cannot this property be sold? If sold, must not some one buy it? If these transactions are legitimate, "why insist that the devil shall be whipped around the stump, unless our purpose is to deceive the unthinking and the ignorant?" The answer to the last question is given by the propounder of it—"We must not begrudge our politicians the privilege of utilizing to the fullest extent the advantages to be derived from stentorian denunciation."

ON TRANSLATING THE 'ARABIAN NIGHTS.'—I.

The first Englishing of 'The Nights' was at the hands of unknown denizens of Grub Street early in the eighteenth century. They pitchforked into Gallic English the French paraphrase of Galland (1704-1717), a *grand traducteur* of the school of Chaucer. The first appearance in English literature, properly so called, was made when Addison retold the story of Alnashar in the *Spectator* (November 13, 1712). Yet the vitality of the Grub Street version, due to the good blood from which it sprang, has been great. It is the parent of the numberless "new and complete editions," "new translations from the Arabic," "careful revisions after the original," which form the stock 'Arabian Nights' to our own day, and which should make up a weighty chapter in the history of the great publishing humbug. The next essays were made, at Simla and at Cairo, direct from Arabic texts. Henry Torrens, Irishman, novelist, poet, the most brilliant figure in a brilliant Indian circle, had felt the glamour and recognized the problem. The single volume which he published in 1838 falls nearer the mark than any other English attempt. It is often inaccurate; it is often free in its turning of the verses; it is not complete. But it is full of the atmosphere of the East; the meadows that shore its seas are bathed in magic light; its figures wander in gardens of enchantment, by the spray of fountains of mystery; the casements of its palaces open

"o'er the foam
Of perilous seas, in faery lands forlorn."

Torrens's prose is almost word for word, and in that is its charm; the simple style of the prose of 'The Nights,' flexible in its simplicity, renders itself; attempts to enrich its vocabulary, to correct its dishevelled order, to bring picturesqueness into its monotonous syntax, and to find epigrams under its common words, only result in imitations of the 'Decameron' or the 'Mabinogion' in a style bewitched with preciousness and conceits. And the quality of its verse, too, has been rightly recognized. All Arab poetry is lyric; dramatic lyric, it may be, of Browning's fashion, but always sung or chanted. It is unthinkable without the living voice to render it, and the living situation from which it springs or which brings it again to mind. An occasion is demanded for it, and it amply fulfils Goethe's canon that the only true poem is the *Gelegenheitsgedicht*. And, further, the poetry of 'The Nights' is, in great part, current coin, running easily from the tongue, held in the memories of all; the same scraps recur again and again, and show their common use. All besides is improvisation, marked with the fluent shallows and fiery nothings of its kind. Between the two we move from classical lines with the dignity of the finest Shaksperian blank verse to rattling drinking-songs struck out with the flash of the moment; from wishywashy love poetry, sung with a die-away grace, to expressions of the noblest religious resignation and trust outside of the Psalms. But all is sung and singable; it swings and rolls in lyric lines of unfailing rhythm. And so, too, it is rendered by Torrens. He did not attempt an exact reproduction of either the thought or the form. That *ignis fatuus* of learned translators, the attempt to naturalize in English essentially foreign metres and rhyme movements, did not lead him its weary dance over the quaking bogs of verbal artifice and jolting rhythms which it haunts. He simply cast his verses in that English form which suited their content, and was justified by the result. His songs sing themselves; his quotations cling. We do not wonder at the memories of their users; we see how the tags of verse must have been light upon the lips. Here and there Burton has used Torrens's translations when a piece of verse was repeated, and the weary journeyers through his version will remember such scraps as veritable oases in the desert. In both these points, then—the verbatim prose, the free verse—Torrens showed that literary instinct and feeling which is more necessary even than scholarship to the successful translator.

If this version had been completed, Mr. Payne has confessed that he would not have attempted his own. But the strange fate that has pursued the original text of 'The Nights' clings fast to its translations and translators. No one can read it through without dying, is the story. It brings bad luck, and this is by some mystery, not by length or folly; for there are tales in Arabic far longer and yet more foolish to the Muslim mind. Yet of all the unluckinesses the worst has been that the appearance of part of Lane's translation (1839-1842) stopped Torrens at the close of the first fifty Nights. Lane, even at that time, was a far better Arabist than Torrens. *He* had been only a very clever man with a linguistic talent; he had picked up some Arabic as he had picked up a dozen other languages. Lane was a scholar and a student. He found the stories of 'The Nights' delightful, but no mere delight in the stories would have moved him to pass them on to others. The value which he set on his translation was the light which it, joined to the elaborate commentary with which he equipped it, shed on the life, the manners and the customs of the mediæval Arabs. In this he was undoubtedly right. No student of the Muslim East can afford to be without it, and a student may read it again and again and learn from it every time. But that is all. It never can be a treasure-house of pleasant things, a great three-decker "to carry tired people to the Islands of the Blest." And the ground is not far to seek. Lane's forte was description; what he saw he could describe so that any one else could see it. But he had no trace of imagination; allusion that produces illusion he knew nothing of. And, further, he had worked out for himself a solid semi-Biblical style that had many points of advantage. It carries with it a certain weight of Eastern truth, but it makes the figures move too like Old Testament patriarchs and prophets, and too little like the lively and often most graceless set that they were. There are men in 'The Nights,' it is true, that might have stalked through Genesis or Samuel, but the prevailing dignity of Lane's prose ill consorts with the out-at-elbows, slouching fashion of most of his original. It is written in no classical forms—except in scraps here and there, where the story-teller very consciously strives to climb the hoights of foine language; it is only a fixing in letter and line of the current *lingua franca* of mediæval Arabic. Lane's failing to see and render this makes him, as Leigh Hunt said, "resemble an Arab full dressed, compared with the lighter half-apparel of Mr. Torrens." And the Arab of 'The Nights' is in "half-apparel" throughout. But it is still worse with the rendering of the verse. That is in prose, too, and it of the flattest; accurate in a verbal way, but infinitely misleading as to use and spirit. Put a song of Béranger or Burns into English or French prose of the market-place, and even then the parallel is not complete. For Béranger and Burns are often read, and those verses were always sung to lute or viol.

The next to enter the lists was Mr. John Payne. His version (1882-1884) is absolutely complete, and is thus in a different class from any that preceded. He served himself heir on Torrens; his object was to do what Torrens had left only begun, and to do it, if more completely, yet with Torrens's aims. At his hands 'The Nights' again became a story-book after their perversion to sociology at the hands of Lane. But the pity is that it is a story-book of mediæval Europe, and not of the mediæval East. It may be that Western chivalry sprang from Antar and his fellow-knights of the desert, but there is a great gulf fixed between the 'Morte d'Arthur' and any Eastern romance. It may be, too, that the Italian novelists, from Straparola down, drew upon Arab tales that came in the wake of the Saracen army of Frederick II., the great Hohenstaufen; even that Ariosto and Boccaccio knew 'The Nights' with their plan. But there is little in 'The Nights' that would not need much change to stand without jar in the 'Decameron,' and almost nothing that could be taken over straight into the 'Orlando.' Mr. Payne deserves all credit for the return which he made to the literary starting-point. But a student of early French poetry and a translator of Villon is sorely handicapped in approaching 'The Nights.' Perhaps a longer acquaintance with Arabic and the Muslim East would have brought riper appreciation of the atmosphere and style of his original, but the fact remains that it is rendered much as he later rendered Boccaccio, that his three Ladies of Bagdad sing to the Rabelaisian Porter much as Fiametta and Filomena sang to their languid company in the Italian garden. Mr. Payne's 'Nights' "suffer a sea-change into something rich and strange," but the richness and strangeness of Wardour Street furniture and of mediæval tapestries go ill with the simplicity and directness of popular Arab speech. Even the pure love-tale of 'The Nights' is not told in the cumbrous style of Boccaccio. The pathos touches more directly; the sentiment is truer and less involved; Chaucer could have rendered it better than any Italian. And when all is made over in similar picturesque fashion—the crudest folk-tales, told without art in a chimney-corner, as homely as in Grimm and to be retold only in Grimm's language, beast-fables that none could retell aright except him who has already retold the stories of Brer Rabbit, other folk-tales, again, which have been wrought with the deftest skill into long creations of genius—all we can say is that it is a very pretty story-book, but it is not 'The Arabian Nights.'

The next adventurer, and in quick succession, was Sir Richard Burton. He knew 'The Nights,' after his erratic fashion, as no other European ever did. Oriental life, above and below the surface—a distinction which does not exist for the East—he knew throughout. He recognized, too, the precise nature of the charm which went with Galland's version and the Englishings which followed him, and how that differed from the tone of the original.

> "The immortal fragment," he says, "will never be superseded in the infallible judgment of childhood." "Those who look only at Galland's picture, his effort to 'transplant into European gardens the magic flowers of Eastern fancy,' still compare his tales with the sudden prospect of magnificent mountains seen after a long desert march; they arouse strange longings and indescribable desires; their marvellous imaginativeness produces an insensible brightening of mind and an increase of fancy-power, making one dream that behind them lies the new and unseen, the strange and unexpected—in fact, all the glamour of the unknown."

The thing could hardly be better put. That he recognized, too, the weakness of Mr. Payne is evident to every one who can read between the lines of his references to his immediate predecessor. The style of 'The Nights,' the prose and the verse in all their phases, he understood. The whole problem of the translator lay bare to him. Perhaps he regarded it as insoluble; perhaps he thought that Mr. Payne had made the nearest approach possible to a solution. At any rate, he turned with all deliberation and gave himself to anthropology as Lane had done to manners and customs. His great work (1886-1888)—for it is truly great—is a clue to 'The Nights' and to the life therein for the Arabist who can weigh Burton's judgments and reject his eccentricities. To the English reader it gives no true idea of the original, and nothing could be further from being an English classic. No one will ever delight in it; many will study it. Perversities of style make it unreadable for its own sake. Such phrases as "a red cent," "belle and beldame," "a veritable beauty of a man," "O, my cuss," "thy hubby," "a Charley," may possibly have Arabic equivalents, but certainly cannot render those for us. No illusion can survive such barbarisms. The long, lumbering lope of its verses, too, is only a degree better than Lane's prose. Its futilities of annotation are a perpetual menace. The fate of the Household Edition brings all to a point: when deprived of unpublishable matter and relying solely on its English value, the book was a flat failure.

THE PARIS EXPOSITION.—VIII.

IN GENERAL.

PARIS, August, 1900.

The Paris Exposition is now, but only now, fairly complete, and one can take stock of the items of success and failure. To an American the only standard by which comparison can be made is, of course, Chicago, and I think the universal verdict is that the effect produced by the nondescript, bizarre style of the Paris buildings, though it is most artistically aided by the use of color, kept well under control, and not allowed to run riot as in the Transportation building at Chicago, is far less imposing and even pleasing than the strictly classical models followed in the group of buildings which surrounded the Court of Honor. The two permanent buildings (to be used, as was the old Palais d'Industrie, which they replace, for the annual Salon and such purposes), are imposing structures, and the court between them forms an appropriate vestibule to the magnificent view of the superb new Pont Alexandre III., and the Avenue des Invalides beyond. But nothing more hideous in color and design than the trumpery temporary Porte Monumentale, which introduces the visitor to the grounds from the Place de la Concorde, was ever conceived. The most pleasing view is that obtained by looking from the Pont Alexandre III. down the Seine, whose left bank is lined for half a mile by the national buildings, rising from a noble and spacious platform, and whose right bank supports the picturesque houses of Old Paris, which so rivet the attention that the eye passes heedlessly over the large, almost too severely plain, building which contains the interesting exhibit of the municipality of New Paris, and the greenhouses for the horticultural display.

Another feature which mars the architectural effect of the more imposing buildings is the confusion created by the intermingling of side-shows with the serious Exposition. The most glaring instance is an ugly yellow shed erected just as you cross the Pont Alexandre III., and which blocks the entrance to the Faïence department of the great Industrial building. Its walls are plastered over with invitations to enter and see within the posturing of Oriental dancing girls. The great space accorded to accessories of this kind was probably determined by financial considerations; but the Exposition proper is so large, and covers necessarily a space so much greater than human strength can possibly compass during the short stay of an average visitor, that it seems to be unwise to distract his attention and use up his energies by forcing him to wander through a labyrinth of side-shows. Some of these are, however, as worthy of visiting as anything within the exhibit walls of the Exposition buildings. Félix's groups of historical figures in contemporary costumes, representative of every period of French history, each group dressed as correctly as the most accurate research enabled eminent students to design, is worthy of being perpetuated. The extraordinary illusion produced by the fleeting scenery of the Trans-Siberian Railroad, as you sit in one of the sumptuous cars of that world-encircling road, is a novelty in panoramic effects. The gorgeous reproduction of one of the rock-hewn temples of Cambodia is a monument that ought to be made of something more durable than plaster. These and others of the accessories really add greatly and appropriately to the educational interest of the Exposition; but they are so buried in a multitude of worthless, money-making, and sometimes highly objectionable concessions that the weary sightseer is likely to overlook them.

As to the Exposition itself, in some departments it is beyond comparison the best ever got together. The industries of neither this country nor England are, in any group, adequately represented, unless it be in the Department of Electricity, where our large companies make a conspicuous demonstration, not only of their machinery, but of its adaptability. The electric railroad and the moving platform—one of the most blessed novelties to the weary pedestrian—are from the workshop of the Westinghouse Company. But France preëminently, then Russia and Germany, and in fact all the nations of northern and central Europe except England, make splendid and most costly demonstrations of what they are achieving in the field of metallurgy, mechanics, the manufacture of textile fabrics, ceramics, and jewelry. The Exposition is built primarily for the glory of France as unmistakably as Chicago's Fair was conceived and executed for the glory of the United States, and therefore, as might be expected, the French exhibits are, in almost every department, the largest and the best. The display of silks and delicate tissues, whether in the piece or made into artistic ladies' clothing, is one which the most uninitiated layman can but look at with awe and admiration. The French metallurgists have also exhibited in their stupendous trophies not only the wonderful feats they can perform out of metal, but the art with which they can exhibit their handiwork, though in this last respect the Swedish exhibitors perhaps rival them. In ceramics Europe shows no advance. Perhaps the most noteworthy exhibit in the whole show is that of our Rookwood potteries. War is painfully *en évidence*. The Krupp Works make no important display of their metal work, intended for peace or war; but Maxim has a pavilion to himself, and the great Schneider Works justify the fame their guns have brought them through the Boer War, by the display they make of weapons of destruction under the huge iron turret which towers above all neighboring buildings.

Nothing can be more attractively displayed than the exhibits in the Agricultural Department, where a prominent and novel feature of the Exposition is beautifully carried out, though necessarily on too large a scale for permanent preservation; namely, the Historical Museum of the past century's progress in agriculture. In each and every section there is a similar collection, intended to illustrate the development of each branch of science and art during the century just closed. These collections of the century's workmanship in metals, furniture, embroidery, etc., do not always show improvement and progress in the resulting products, however much advance the last-made articles may exhibit in cheapness and rapidity of manufacture over the first; but as fields for study they are so important that it is to be hoped they will be, as far as possible, assembled into a permanent collection, when the Exhibition closes. There is room for most of these in the sumptuous building opposite the French Art Gallery, the Petit Palais, where are now shown the finest examples obtainable of the masterpieces of ornamental art work, as expressed above all in Church ornaments and vestments from the earliest times of Gallic civilization till today. One difficulty, and perhaps an insuperable one, in the way of securing and combining these scattered groups of historical objects, lies in the fact that they are composed in great measure of treasured articles lent by private collectors. But the same generosity which impelled the owners to lend them for a season might, seeing how their liberality has been appreciated, tempt them to extend the benefit. In truth, some such memorial and perpetual residuum of these immense agglomerations of beautiful and instructive objects is the only way of obtaining any adequate compensation for the enormous thought and energy expended on their collection and arrangement. Very few of the millions of footsore and exhausted wretches who, in a mental state of semi-consciousness, drag their weary limbs through miles and miles of galleries, in which such a variety of objects are passed in such rapid succession that each succeeding effort of mind obliterates the memory of the preceding observation, carry away anything but the vaguest impression of what they have seen.

But if from these stupendous piles of material there could be selected a typical collection of the objects which would illustrate the perfection reached by each art, and the steps by which it was attained, or the retrogressive stages which mark its decay, and these objects were preserved for study in quietness and ease for all time, the intrinsic value of these overgrown expositions would be enormously enhanced. Had such collections been made from all the great world's fairs since that of 1851, there would be available for the student and manufacturer a series of standards of comparison which would be of inestimable value. We attempted to do it in the Armour Museum after the Chicago Fair, but in an unsystematic fashion and with somewhat incongruous results.

Turning from the Exhibition to the greater exhibition in which it is set, Paris itself, the city never looked more beautiful, and never succeeded better in courteously treating its guests—at least, that was my experience, and the experience of almost all whom we met. Englishmen and Americans who were delegates to the several Congresses were accorded fully, if not more than, their share of honor, and every class of the people, from railroad porters to cab drivers, seemed to vie with each other in civility. Of course, as is right and to be expected, every one is endeavoring to make all he can legitimately, and some are probably trespassing beyond the bounds of reason and propriety in taking advantage of this rare opportunity of filling their pockets; but the charge of universal extortion is as unjust as that of universal incivility. The more popular hotels have raised their rates for rooms about 50 per cent., but the restaurant rates are not much above normal. The cab drivers are grateful for a *pourboire* of 10 sous instead of 5 sous—not a serious tax on any one's resources; and gratuities generally should be increased if a kindly farewell is to be expected on parting; but all who yield to these legitimate excesses, and who invite civility by according civility, will have no grounds for complaint. Moreover, any slight overcharge outside the Exposition grounds is compensated for by the low rate of admission. No money is taken at the gates, but tickets are sold by hawkers on the streets, in stores, and everywhere. And day by day the syndicate which controls the sale fixes the price of a one-franc admission ticket. It sold down occasionally to 20 centimes or 4 cents, but some days rose to 45 centimes (9 cents). Even if, therefore, there are 150,000 admissions, the gate money does not amount to a very large sum. On fête nights, and to visit the Friday illuminations, those who enter after six o'clock are usually charged four admission tickets. The Exposition 20-franc bonds, which cover not only the vague chances of profits, but twenty admission tickets, a share in a lottery, and a right to a discount of 25 per cent. in the price of admission to many of the side-shows, are selling at from 10 to 15 francs. The Exposition is therefore not likely to be a financial success, and consequently the universal good humor is the more to be commended.

JAMES DOUGLAS.

Correspondence.

THE MUSIC HALL AND THE BOER.

TO THE EDITOR OF THE NATION:

SIR: The burghers of the South African Republics have been treated throughout the war as regular belligerents, a character to which they had an unquestionable claim, the Transvaal having been designated in the indictment of the Jameson Raiders as a foreign state, and they having observed the laws and humanities of war. But now, because they hold out as guerrillas when they have been overwhelmed rather than conquered in the field, the edict goes forth from the Imperial Music Halls that they shall be treated not as belligerents, but as rebels, and shot when they are taken; while their farms are to be burned and the women and children turned out to perish. This is exactly what Maximilian, or rather Bazaine, did in Mexico. In that case American opinion was not doubtful.

It is manifest that the Boers would have laid down their arms before this had they been treated as honorable enemies. But Mr. Chamberlain would have nothing but abject and unconditional submission. It is a pity that there cannot be infused into the statesmanship of the man who has the character of the country in his hands, something of the sentiment of an English gentleman.

EQUITY.

August 22, 1900.

THE STATE OF ITALY.

TO THE EDITOR OF THE NATION:

SIR: The death of King Humbert is too freshly in our minds for one to say what historical truth demands, and he was such a sympathetic figure personally, so sincerely devoted to his people and in many ways so noble an example to the rulers of Europe, that it is difficult for me, who lived in Italy most of the time of his reign, knew him personally, and always received such courteous recognition as an honest friend of Italy, to express my honest convictions concerning him. But I cannot allow the *Nation* to commit itself (No. 1831) to the prevalent error, that his death is, politically, "loss to Italy." When my hands are freer from the pressing engagements now holding me, and the period of mourning for the man has passed, I shall, I hope, be able to do justice at once to him and to Italy; but I must now say that, in his mistaken conception of his duty to the Crown and his people at large, he has done more than any other man or combination of men in Italy to open the way to the legislative anarchy which exists and the social anarchy which is preparing.

One of the wisest and most patriotic Italian statesmen I know, whose participation in public affairs began before the kingdom of Italy, said to me in the last year of my residence in Rome, that the only hope of the endurance of the monarchy was in the abdication of the King; and this was true. To make it clear and to do justice to Italy without injustice to the late King as man, citizen, and gentleman, would be impossible for me at the moment; but the fact is that the progress of political demoralization in Italy has been largely due to the fact that Humbert never insisted on maintaining the conservative prerogatives of the Crown, but paid the same deference to a disorderly demonstration of the subversive minority that he did to the deliberately expressed will of the constitutional majority of the nation. I do not believe that the kingdom of Italy, as now constituted, could have resisted ten years more of his reign, which was in every sense the antithesis of that of his father.

But in more than this you are mistaken. "The oppressive burthen of the Triple Alliance" is a phrase absolutely without sense. The Triple Alliance saves the country fifty million francs a year, and has permitted a reduction of the standing army by a hundred thousand men, directly and indirectly, and allowed a still larger reduction if the King could have been induced to consent to it. Every attempt at reform of the army involving reduction of the *cadres*, in Crispi's time and in the succeeding Ministry of Gen. Ricotti, however, broke down before the opposition of the King. In the beginning of the Triple Alliance, the German Government advised the reduction of the army by 100,000 men, which the King consented to only after financial disasters had made it imperative.

The "humiliation of the Abyssinian campaign" was directly and solely due to the King's refusal to permit the recall of Baratieri, who refused to obey the order of the Ministry.

The "crushing weight of ever-increasing taxation" is another fable. The fact is that Italy is rapidly growing rich, faster in proportion than France; and this great prosperity is the momentary salvation of the existing order of things, which politically is being continually undermined, and in the day of real national depression it will go down like a house of cards. The "growth of socialism and anarchy" is most rapid in the most prosperous portion of Italy, especially in Milan, where the wealth and commercial and industrial activity are greatest and the working classes are well to do.

From what I know of the new King, Victor Emanuel III., I believe he will be a sterner guardian of the prerogatives of the crown than his father was, and that his ideal of a sovereign is rather his grandfather. And he will do what his father never did, viz., listen to the counsels of Queen Margherita, who had always a higher standard of royal conduct than Humbert. But that any wisdom on the part of the sovereign can stop the decline, I do not believe. Italian politics are rotten, and the Parliament is the derision of the whole country. The Legislature, the bench, and the bar are to such a degree corrupt that no instrument of reform remains. The people would rejoice at the abolition of the elective chamber; it has no faith in the justice of the courts or the honesty of the *avvocati*—a hungry swarm, who, as my personal experience proves, are more ready to sell the case to the other side than to fight it out honestly. And the late King never moved a hand to further any reform.

Yours truly, W. J. STILLMAN.

FRIMLEY GREEN, SURREY, ENGLAND,
August 14, 1900.

THE MUSLIM LEGALITY OF CHESS.

TO THE EDITOR OF THE NATION:

SIR: Will you permit one whose knowledge of the problem of the origin of chess is derived mainly from the excellent article by "W. F." in your issue of the 16th, to offer one or two comments from the point of view of a student of Muslim jurisprudence?

In that article Professor Macdonell of Oxford is quoted as asserting that chess "may have become known in Spain under the Saracen ruler Hakem II. (961-976)," and that assertion is criticised as a mere inference and as based upon surmise.

I do not know why this especial "Saracen" is drawn into the controversy, but it is safe to say that chess must have been known in Spain under Hakam II. (I presume it is al-Mustansir, the Umayyad Khalifa of Cordova), and that he must have had in his library books dealing with chess. The reason is, that the legality of chess is one of the most vexed questions in Muslim law, and has been debated by the Muslim lawyers since the earliest times. Sections on it form part of every law book. The point not only is an ethical one, but has a direct bearing on legal praxis. Can one who plays chess for a stake or for nothing, often or occasionally, be admitted as a legal witness? Does such playing do away with his legal integrity and reduce him to be "a person of light understanding," whose testimony must be rejected? Over that the lawyers have fought since there was law in Islam; and it is evident that it was a question of a common practice of which law had to take account.

As I have few Arabic books here, I cannot quote much immediate evidence, but no student of Muslim law would ever dream of disputing what is said above. I give now what immediate evidence I can. In the time of the second Umayyad Khalifa, Yazid I. (A. H. 60-64; A. D. 680-683), chess (*shatranj*) was played at his court: see Von Kremer, 'Culturgeschichte,' i., p. 142, who refers to De Goeje, 'Fragm. Hist. Arab.,' p. 102, inaccessible to me here). Even then the legality was in doubt. The believer, according to a tradition from the Prophet, should amuse himself with three things only—his horse, his bow, and his wife or wives. These are evidently all on much the same basis; we may compare the saying of 'Umar, the second Khalifa, to his wife, "Thou art naught but a plaything in the corner of the house." What, in that case, asked the lawyers, is the position of such an amusement as chess? If a man plays it as a pastime, it comes within the sweep of this tradition, is useless, vain, and destroys legal status. If, on the other hand, he plays for a stake, it comes under the direct Qur'anic prohibition of gambling, as a thing in which there is more evil than profit. Such is the interpretation of the case by Abu Hanifa, the founder of one of the four legal rites, who died in A. H. 150 (A. D. 767). No legal writings of his have come down to us, but we have a tractate by his immediate pupil, Muhammad ibn al-Hasan (d. A. H. 189=A. D. 805) called 'al-Jami' as-Saghir fil-fiqh' (The Lesser Collection in Law), in which the opinion of the Master is clearly laid down that it is illegal to play at nard, shatranj, and fourteen, whatever that may have been. But ash-Shafi'i, the founder of another of the four schools, who died A. H. 204 (A. D. 817), ruled that while playing for a stake was distinctly illegal, yet a man might play at chess for the sake of his mind; it is, therefore, not simply an amusement, and so does not come within the tradition from the Prophet.

I regret that, situated as I am here, I am unable to state the views of Mālik ibn Anas and Ahmad ibn Hanbal, the founders of the remaining two schools. But enough has been given to show how important a part shatranj plays in Muslim law. Further, it is to be remembered that these four founders of schools were simply the first jurists to leave behind them a systematic body of teaching and a missionary school of pupils. The juristic development runs back far beyond their time, and, in fact, to the death of Muhammad in A. H. 11. I have already pointed to traces of shatranj in the reign of Yazid I. (A. D. 680-683), and I cannot doubt —if your writer will pardon my "English pen"—that the game, in Arabia, goes still farther back.

One word more. I do not understand how "unter seinem auf das Sanskrit *caturanga* zurückgehenden Namen" can be rendered, as it is on p. 132, col. 3, "under a name which is a reversion to the Sanskrit *caturanga*." DUNCAN B. MACDONALD.

NEW HARBOR, MAINE, August 20, 1900.

THE FORTUNES OF A PLAGIARISM.

TO THE EDITOR OF THE NATION:

SIR: Though, not improbably, the matter here brought forward has already been ventilated in some quarter or other, yet the historico-literary interest which attaches to it may be held to justify the hazard of repeating what can hardly be familiar to the general reader.

In 1727, William Warburton, eventually Right Reverend by celestial courtesy, but, from first to last, something very different, weighed ethically, put forth a small book, his second venture as an author. Its title, much too long to be transcribed in full, begins: "*A Critical and Philosophical Enquiry into the Causes of Prodigies and Miracles.*" Of this performance, one of promise, but immature and ill-written, the final paragraph, in which the University of Oxford is had in contemplation, is in these words:

> "Methinks I see her, like the mighty Eagle, renewing her *immortal Youth*, and purging her opening Sight at the unobstructed Beams of our benign Meridian SUN, which some pretend to say had been dazzled and abused by an inglorious pestilential METEOR; while the ill-affected Birds of Night wou'd, with their envious Hootings, prognosticate a Length of Darkness and Decay."

Warburton's salient peculiarities, illaudable as well as laudable, were pronounced already in his middle age; and his promotion to the episcopal bench failed to operate perceptibly in repressing manifestations of his coarse and intolerant idiosyncrasy. Coupled with genuine erudition—and such, though deficient in exactness, was his—we ordinarily observe, if not humility, a modest reticence; but, with him, it was wholly otherwise. At least, in the ranks of the learned, a man of more towering arrogance has been a phenomenon of rare occurrence. With mordant wit, it was said of him that he would have tossed up his nose at the twelve Apostles, if he had met them in the street. Such, even, was his ungracious disposition, that, as an author, he could not, to his content, announce his sense of his own matchless superiority, without indulging in jibes and flouts not far removed from billingsgate. To traverse his opinions, valid as might be the grounds for so doing, was, in his eyes, enough to stamp any one as well-nigh a criminal. Moreover, in the case of the dead whose views chanced to run counter to his own, his malice towards them was no less acrimonious, as were his denunciations of them no less contumelious, than they were when their objects were living speculators who deviated from his ways of thinking. In short, an odious type of humanity is that which he represented, despite the strenuous efforts of the sycophantic Bishop Hurd to paint him into fair-seeming. If, from an attorney, which he was at the outset of his career, he had effloresced into a judge, and so realized a destiny to which his ability was competent, history might have had, in him, his environment permitting unbridled license of evil-speaking, a second Jeffreys. As it was, since he besmirched a mitre, instead of the ermine, we must go back to Bishop Bale, a passed-master in base invective, to discover his parallel. Curious reading, to particularize, is his correspondence, provided we are entitled to look for a personal exemplification of the charities and the proprieties in an official teacher of them. To do the consecrated swashbuckler even-handed justice, however, no slight praise is to be awarded him for the admirable letter of expostulation which he addressed to the notoriously unclerical Sterne.

Among the many on whom, to his discredit, this vulgar-souled prelate expectorated his spite, was one whom he must have heartily wished that he had not provoked to retaliate. This was Robert Lowth, who, in 1765, the year before he was raised to the see of St. David's, was incited to reply to his traducer.

The circumstances were these. Lowth, in his *De Sacrâ Poesi Hebræorum Prælectiones*, where discussing the *Book of Job*, took exception, but without specifying anybody, to certain theorists, for postponing its date to the Babylonian Captivity. These theorists, he says, "non multo sanius in Hebraicis judicare videantur, quam in Latinis Harduinus." Warburton, in the catalogue of whose accomplishments a critical acquaintance with Latin was not included, understood, by *non multo sanius . . . quam*, "almost as *insanely . . .* as," and, besides, found himself bracketed with the fantastic Père Hardouin, who had contended that the works attributed to Virgil and Horace were forgeries of medieval monastics. This, with similar causes of offence, produced a result that was to be anticipated. The unseemly details are to be seen in the Appendix to Book vi. of the *Divine Legation*, which, only slightly exaggerating, Lowth charges with "sophistry, buffoonery, and scurrility."

In his vivacious and incisive answer, Lowth thus makes mention of his adversary's juvenile essay above adverted to:

> "You set out with favourable thoughts and high notions of the University of Oxford, and, in one of your first literary performances, at a time when your panegyric was not, certainly, better applied than it might have been now, you no sooner touched upon the subject than you took fire at the bright idea: rapt in the spirit of prophetic enthusiasm, your *Musa Pedestris* immediately got on horseback, and, mounted on her Pegasus, away she went in this high prancing style:
>
> 'majorque videri
> Nec mortale sonans':
> 'Methinks I see her, like the mighty Eagle,
> renewing her *immortal Youth*, and purging
> her opening Sight at th' unobstructed Beams
> of our benign Meridian SUN; which some
> pretend to say had been dazled and abused
> by an inglorious pestilential METEOR;
> while th' ill-affected Birds of Night would, with
> their envious hootings,
> prognosticate a Length of Darkness and Decay.' "

And here is a passage from the *Areopagitica*, which any of my readers conversant with English literature according to the standard of the present day will have expected to be adduced in connection with what precedes:

> "Methinks I see in my mind a noble and puissant Nation rousing herself like a strong man after sleep, and shaking her invincible locks: Methinks I see her as an Eagle muing her mighty youth, and kindling her undazl'd eyes at the full midday beam; purging and unscaling her long abused sight at the fountain it self of heav'nly radiance, while the whole noise of timorous and flocking birds, with those also that love the twilight, flutter about, amaz'd at what she means, and in their envious gabble would prognosticat a year of sects and schisms."

To draw to a conclusion, there now appears on the stage one who, though his supreme aim was to strut behind a pastoral staff, never succeeded in flourishing otherwise than as mere Dr. Parr. With no motive more creditable than a wish to annoy, this pompous and sterile bookworm was pleased to unearth and reprint, in 1789, what forms a collection entitled *Tracts by Warburton and a Warburtonian*, in which, at p. 140, is the first quotation given in this letter.

Neither Lowth nor Parr, if cognizant that Warburton had plagiarized, though no more than nibblingly, from Milton, would have forborne to blazon and accentuate the fact. But the prose works of the poet, down to the time when the present century was well advanced, were very little recognized. As regards his poetry, indeed, even in the days of Queen Anne it had become so far neglected that the essays devoted to it in the *Spectator* virtually announced a revelation to Addison's contemporaries. Political and ecclesiastical prejudices, both then and long after, as earlier, conspired to keep his transcendent merits largely veiled in eclipse. For instance, shortly after his death, he was, to Thomas Flatman, in his dreary *Heraclitus Ridens*, only "old Milton," and "that grand Whig Milton," and was depressed to a parity with the low-bred Edmund Hickeringill; as late as 1718, to the author of the *Entertainer*, he was, in round terms, "infamous"; and no one requires to be told of the gross injustice done him by Dr. Johnson. Not at all unlikely is it, that his having the freethinker Toland for biographer and editor was, with many, a factor detrimental to his memory. Little is the wonder, then, everything considered, that Warburton felt secure in picking and stealing from him, and that his thievery should have gone undetected by Lowth and Parr,—all which is noteworthy, as contributing to shed an interesting light on English scholarship in the eighteenth century.

F. H.

MARLESFORD, ENGLAND, June 28, 1900.

P.S.—The *Dictionary of National Biography*, since I dwell in the wilderness, I have no opportunity of seeing; and I was unaware, till the Editor of the *Nation*, by sending an extract from it, after reading this letter, apprised me that Warburton's plagiarism had been exposed by Mr. Leslie Stephen. As has been seen, however, it is Oxford, not, as Mr. Stephen has it, Cambridge, that the Bishop alludes to. And now have I been forestalled in tracing the fortunes, in the last century, of Warburton's pilfering? All the materials of my letter, and arranged as above, I have had by me upwards of thirty years.

F. H.

July 21, 1900.

Notes.

Henry Holt & Co.'s preliminary fall announcements include the first two volumes of 'A History of Political Parties in the United States,' by Prof. J. P. Gordy of the Ohio State University; 'The German and Swiss Settlements of Pennsylvania,' by Prof. L. Oscar Kuhns of Wesleyan University; 'A Source-Book of English History,' edited by Dr. Guy Carleton Lee of Johns Hopkins; 'The Seventeenth Century in France,' selections from well-known authors by H. Isabelle Williams and Delphine Duval of Smith College; 'A Short History of French Literature,' by L. B. Kastner and H. G. Atkins; 'A French and English Dictionary,' by Prof. A. H. Edgren and Percy B. Burnet; 'The Elements of German,' by Dr. H. C. Bierwirth of Harvard; 'Byron's Selected Poems,' edited by Dr. F. I. Carpenter of Chicago University; 'Pater: Selections,' by Prof. E. E. Hale, jr.; 'An Agricultural Botany,' by Prof. John Percival; 'A Manual of the Flora of the Northern States and Canada,' by Prof. N. L. Britton; and 'The Anatomy of the Cat,' by Prof. Jacob E. Reighard and Dr. Herbert S. Jennings.

From Dodd, Mead & Co.'s list we select 'The Chinese Problem,' by Chester Holcombe; 'Chapters on War and Policy,' by Spenser Wilkinson, military critic of the London *Morning Post;* 'Travels in London, Paris, and Berlin,' by the late G. W. Steevens; 'Life and Sport on the Pacific Slope,' by Horace Annesley Vachell; 'Pompeii,' by Pierre Gusman, with numerous illustrations, many colored; 'African Nights' Entertainment,' by A. J. Dawson; 'From the Land of the Shamrock,' by Jane Barlow; 'Wanted: A Matchmaker,' an illustrated Christmas story, by Paul Leicester Ford; 'New York in Fiction,' by Arthur Bartlett Maurice, editor of the *Bookman;* 'William Morris,' a critical essay, with selections by Prof. Wilbur L. Cross of Yale; the two final volumes of Augustus J. C. Hare's Life; 'A Short History of Music,' by Anna A. Chapin; 'Musical Studies and Silhouettes,' from the French of Camille Bellaigue; 'Idle Idyls,' by Carolyn Wells, illustrated by Oliver Herford; 'Pictoris Carmina,' illustrated by the author, Frederic Crowninshield; 'The Wedding Day in Literature and Art,' by C. F. Carter; Shakspere's "As You Like It," illustrated by Will H. Low; 'Pippa Passes,' illustrated by Margaret Armstrong; and 'The Pronunciation of 10,000 Proper Names,' by Mary Stuart Mackey and Marietta S. Mackey.

The significant items in T. Y. Crowell & Co.'s list are a new and complete illustrated edition of Balzac's 'Human Comedy,' in sixteen volumes (de luxe, thirty-two), with elaborate introductions by Prof. W. P. Trent of Columbia; Tolstoy's 'Complete Works,' in twelve volumes, edited by Nathan Haskell Dole, and his 'Essays, Letters and Miscellanies'; 'The Poetry of the Psalms,' by the Rev. Henry van Dyke; and 'The Religion of a Gentleman,' by the Rev. Charles F. Dole.

The Century Company will market here the sumptuous centennial edition of the 'Fairy Tales of Hans Christian Andersen,' illustrated by the foremost Danish artist, Hans Tegner. The translation is new.

From Doxey's, No. 15 East Seventeenth Street, will issue 'Jacinta,' poems by Howard T. Sutherland.

'Mr. Dooley's Philosophy,' by F. P. Dunne, illustrated by F. Opper and others, is in the press of R. H. Russell.

'The Church Past and Present,' by the Bishop of London and others, and 'Essays Practical and Doctrinal,' by the Rev. S. D. McConnell, D.D., are announced by Thomas Whittaker.

D. Appleton & Co. will shortly issue 'The Boers in War,' by Howard C. Hillegas.

'The Law of Operations Preliminary to Construction in Engineering and Architecture,' by John Cassan Wait, is to be published by John Wiley & Sons.

Eaton & Mains have in preparation 'A History of Babylonia and Assyria,' in two volumes, by Robert William Rogers, LL.D.

E. P. Dutton & Co. announce "The Library for Young Naturalists," edited by F. Aflalo, "for boys," as the publishers explain—but why not for "youth," regardless of sex?

A timely third edition of Thomas Hudson McKee's approved manual, 'The National Conventions and Platforms of All Political Parties, 1789-1900' (Baltimore: Friedenwald Co.), brings it down to date, and now one has at command all the platforms, all the candidates' names (barring third party this year if it come into being), all the electoral and popular votes. As respects the platforms, it is a mine for study. Portraits of all the Presidents, from engravings, are thrown in.

We reviewed in the early summer the French original of the translation now published by Harper & Bros., 'From India to the Planet Mars: A Study of a Case of Somnambulism,' by Prof. Flournoy of Geneva. The present version is by Daniel B. Vermilye of Columbia University, who furnishes also an introduction. Views of the Martian landscape, which recalls Japan, with sundry facsimiles, adorn the volume.

Mr. I. C. Hannah, M.A., Trinity College, Cambridge, was Master of the English school at Tientsin for two years, and used his spare time there in compiling 'A Brief History of Eastern Asia' (London: T. Fisher Unwin). His book shows diligence and care, but it essays a hopeless impossibility. No one could compress within such narrow limits an adequate treatment, on however small a scale, of the history from prehistoric times till now of all Asia, even when those countries are excepted which go more peculiarly with the Mediterranean—Persia, Syria, Arabia, and Asia Minor. Nor was Mr. Hannah supported in his task by an adequate width of reading. It is true that such a thesaurus as Dr. Williams's 'Middle Kingdom' is in his bibliography, but it shows very oddly beside a string of books, doubtless excellent in their way, from the various series of the S. P. C. K. and the "Story of the Nations." Further, Lord Macaulay's 'Essays' are not accepted historical sources, and Allen and Myers's 'Ancient History for Colleges and High Schools' may be left to such institutions. In this bibliography, too, there is not a single volume in any language but English. Mr. Hannah has turned out what will be for many a suggestive if irritating book; but it is a great pity that he did not rather give himself to a study of Chinese education, or some other subject on which he must have been in a position to acquire first-hand knowledge. The writing of histories may be turned over with advantage to the less fortunate people who must stay at home and read books.

The 'Traditions of the Chilcotin Indians' are described by Livingston Farrand in the latest publication of the Jesup North Pacific Expedition. It forms the first part of volume iv. of the Memoirs of the American Museum of Natural History. The Chilcotins are of Athapascan stock, and occupy a territory lying chiefly in the valley of the Chilcotin River, in the interior of British Columbia. The most elaborate and best known of the traditions is that in which are related the adventures of the culture-hero and transformer Lendix:tcux and his three sons. A striking fact revealed by the study of this tale is that analogues for nearly every element of the story are found in the mythologies of neighboring tribes, while in no one is there a complete correspondent of the whole myth. The present collection will, it is believed, prove an instructive contribution to the comparative mythology of the Indians.

'The Thompson Indians of British Columbia' is another memoir by James Teit, in the same series. These Indians were once known as the "Couteau" or Knife tribe. They are of the Salish stock, and their habitat is a region embracing about 9,000 square miles in the southern interior of British Columbia. In appearance they resemble other tribes of the western plateaus, and their culture bears evidence of having been influenced by the north Pacific coast tribes and, to a greater extent, by the Plains Indians. Their style of dress, their use of feather ornaments, and their method of building round tents instead of square lodges, are the result of contact with their eastern neighbors by way of the Nicola Valley. Their manufactures show affiliations with those of the coast, and their tools for woodwork, hammers, harpoons, and fish-knives are evidently copies of implements used by the coast tribes. Their sagebrush-bark fabrics are of the same make as the cedar-bark garments of the coast. Their whole social organization is very simple, and the range of their religious ideas and observances very limited when compared with those of other American tribes. Numerous woodcuts and several heliotypes illustrate this publication.

Still a third memoir is 'Symbolism of the Huichol Indians,' by Carl Lumholtz. It opens with a brief sketch of the characteristics of the Huichols, a tribe numbering about 4,000 individuals living on a spur of the great Sierra Madre in the northwestern part of the State of Jalisco, Mexico. They are of medium height, light reddish-brown in color, emotional and cowardly. They are very healthy, subsisting all the year round on corn and beans, and eating meat only at their religious feasts; the hunting of deer and the killing of cattle being always connected with religious ceremonials. From their symbolism it may be inferred that the moving principle of their religion is the desire of producing rain, and thus successfully raising vegetables. Their philosophy of life is summed up in the remark of a Huichol servant: "To pray for luck to Tatévali [the god of fire] and to put up snares for the deer—that is to lead a perfect life." Their principal gods are obviously natural phenomena personified, and represent the "four elements." Among the symbolic objects which occupy a most prominent place in their religious cult are ceremonial arrows and back-shields, which serve to convey personal supplications, and front-shields, used in tribal prayers. The votive shield is the most important symbol, and is adapted to serve as a kind of sign-language between man and god. The resemblance of these objects, if arrayed in rows, to the shield-shaped writing in the ancient Maya temples and codices suggests an explanation of the origin of Maya writing. This memoir is abundantly illustrated, partly in color.

The prospectus of the *Monthly Review*, to be edited by Henry Newbolt, and published by John Murray in September-October, is taking in many ways. A serial novel, illustrations, and a permanent editorial department are to be regular features; the illustrations not for ornament, but for their legitimate purpose of elucidation, and therefore quite subservient to the text. The editorial writings will be by many hands under one control, and all unsigned. The type to be employed is large and handsome.

A few years ago a gentleman well known in French educational circles pointed out to us, from the upper window of the only building now remaining of the palace of St. Cloud and its appurtenances, the wooded heights and valley of Meudon, "once the abode of Rabelais," where, to quote from another French source, "he amused his parishioners with his songs and copious draughts, if he did not edify them by his ecclesiastical virtues." Now M. Brunetière tells us, in the *Revue des Deux Mondes* for August 1, that very likely "le joyeuse curé de Meudon" never set foot on the soil of his parish, and that, possibly, he never drank anything but water. That the extreme vulgarity of the author of Gargantua and Pantagruel in any degree reflects his own life, we have no right to assume in the light of what is known of the latter. But M. Brunetière, as might be expected, does not withhold his severe condemnation of the writer, much as he enjoys his originality, enthusiasm, power, and style. The essay, which is a chapter from a History of Classical French Literature soon to appear, strikes us as one of M. Brunetière's best productions.

The chair occupied by M. Levasseur at the Collège de France bears at present the name of "Chaire de géographie, histoire et statistique économiques." The name dates from 1885, but M. Levasseur commenced his lectures as early as January, 1869, and received his regular appointment in December, 1871. Upon the request of the editor of the *Revue Internationale de l'Enseignement*, he now gives an account of his thirty-two years of teaching, in the July number. Besides explaining his conception of the subject intrusted to him, and showing in what spirit he has treated it, he gives a complete list of the topics discussed in the many hundreds of lectures delivered from the beginning of his career at the Collège. Their scope is wide, and comprises a large part of the countries and nations of the globe. To this continent he devoted forty-two lectures in 1872-'73, and one hundred and twenty-five during 1881-'84; to the United States alone two hundred and forty-four in the years 1893-'99. France, very naturally, received the lion's share of his long-continued study and teaching. As hardly any of M. Levasseur's lectures have been printed, even these summaries of courses will not be without interest to students of economics. Much of the material presented to his hearers at the Collège de France, however, has been used in M. Levasseur's published works, of which he speaks briefly in his communication to the *Revue*.

The need of a radical change in elementary education in rural England was strongly urged by the Duke of Devonshire at the annual prize distribution at the Countess of Warwick's technical science and agricultural school at Bigods, Essex. Referring to the statement made in Parliament that the squire and the farmer were not, generally speaking, friends to education, he gave as the reason that the effect of the present system was simply "to induce the cleverest, the brightest, and the most energetic of our boys and girls to leave their villages in the country and to seek for other occupation in the great towns." The great obstacle, of course, to the immediate substitution of a rational system is the want of teachers properly qualified to fit girls, for instance, to take part in the management of the dairy, the garden, and the orchard; but the secondary schools are being reorganized and agricultural schools and colleges established to meet this want. It remains to be seen whether the farming class will realize the value of the new methods of instruction.

The increasing importance of our trade with Germany—the value of the exports from the northern part of the empire alone to this country for the first quarter of the present year amounting to eighteen millions of dollars, or double that of 1898—gives especial value to Consul-General Mason's effort, in the July Consular Reports, to remove the trade misunderstandings which prevail between the two nations and provoke much hostility. He shows, by many instances, that they arise most frequently from ignorance or "failure to comprehend the many customs and details of practice in respect to which the two peoples differ, radically, but honestly, as the inevitable result of diverse traditions, education, and racial instincts." As an incentive to American importers, he says that among the Germans at large there is "no prejudice in favor of home-made goods." An interesting account is given of a cabinet-making school at Magdeburg, founded and almost wholly supported by a mechanic. Each apprentice is given four lessons a week for three years in the use of tools, free-hand drawing, design, decoration, and sculpture, the instructors being mainly "boss mechanics" of the cabinet-makers, aided by a few salaried teachers.

The principal topic of the August Reports is a detailed account of the Brazilian railways, from which it appears that there are 63 separate lines operating 9,197 miles of road, costing nearly six hundred million dollars, with a net income of about one-half of 1 per cent. There are also several reports on the foreign trade of China, showing its astonishing increase up to the outbreak of the "Boxer" rebellion. Referring to the effect of the railways, it is said that "immediately trains begin to run, districts through which there was comparatively little traffic, such as between Paoting and Pekin, suddenly commence to hum with life and activity, and there springs up a flourishing trade which was formerly undreamed of and impossible for want of cheap transport." In answer to the frequent inquiry as to what language must be used in sending out catalogues—"some firms offer them in German, but more in Spanish"!—a consul says: "One must know either English or Chinese, or starve." He adds that English is regarded as solely the language of Great Britain, "for most Chinese imagine that Americans speak another tongue, and, like the Germans, French, and others, must learn English."

—There was certainly room for a good one-volume history of Puritan Massachusetts, but we cannot think that Mr. Daniel Wait Howe's 'Puritan Republic' (Indianapolis: Bowen-Merrill Co.) quite fills the gap. At the same time, the book has a good deal to commend it. The author's enthusiasm for his subject has led him to the sources of information, and his pages show industrious and intelligent use of the early records and laws, and the writings of contemporary actors. The chapters on various phases of Puritan life, especially religion and church-going, education and the professions, agriculture and trade, and the daily family round, are both entertaining and instructive. What we miss is the orderly and straightforward narrative of events, showing the rapid development of Massachusetts Puritanism from an ecclesiastical system to a form of government, and the disappearance of the old theocracy under the combined influences of social expansion and political complications. Such topics as the relation of church and state, the controversies with Roger Williams, Mrs. Hutchinson, and the Quakers, and the loss of the old charter, Mr. Howe, indeed, treats with particular fulness, and with many interesting additions to the common stock of incident; but the prevailing episodical method is hardly successful in impressing the characteristics of the period as a whole. The author's historical judgments, while not profound, are restrained and fair, and the whole tone of the work bespeaks a writer who venerates, but does not blindly worship, the Puritans and their deeds.

—'The Rockies of Canada,' by Mr. W. D. Wilcox (Putnams), is based upon 'Camping in the Canadian Rockies,' which appeared four years ago, but the difference between the first and second editions is so great that the change of title is quite justified. Mr. Wilcox has continued his visits to the Rockies and Selkirks since 1896, with excellent results, if one may judge from the new photogravures and from the account of fresh geographical exploration. When reviewing the former volume, we called attention to the absence of maps. This defect, the only one of consequence in the book, has since been repaired, for Mr. Wilcox now gives us "a special contour map which shows the details of the country near Lake Louise, and a general map of the Rocky Mountains, compiled from all the best maps hitherto published, supplemented by several recent sketches." There is also a good plan of the district between the Kicking-horse and Vermilion Passes. Among the additions to the text must be mentioned special chapters on "Mountaineering," "Camp Life," "Hunting and Fishing," and "The Stony Indians." During the past few years a good deal of new country around the head of the Saskatchewan has been travelled, the region of Mount Assiniboine has become better known, and several of the mountains near the railway have been climbed by different routes. The geographical part of the present edition is, we think, more important than the other supplementary material, and we shall accordingly confine our notice to it. Mount Assiniboine, which attracted Mr. Wilcox's attention in 1894, has been revisited by him, and information concerning it occupies a prominent place among his original discoveries. This peak, situated about twenty-five miles from Banff, may be called the finest of the Canadian Rockies to the south of the railway. Its height has been fixed by the Geological Survey of Canada at 11,830 feet, and in outline it bears strong features of resemblance to the Matterhorn. It can be reached by several routes from Banff, but the line which lies "along the high plateau region on the summit of the Rockies is the most varied and interesting way." Mr. Wilcox has now seen every side of it, and thinks that the south face offers the best chance of an ascent. "Every side of this mountain is exceedingly steep, the east face being an absolute precipice, and the other two having slopes that average fifty degrees. The rock strata are nearly horizontal, and are eroded into many precipitous bands which girdle the mountain, and these, together with the disintegrated limestone and frequent fresh snow, will make it a difficult prize for the climber." Besides describing his own discoveries, Mr. Wilcox records the ascents made by English tourists in 1897 and 1898. Dr. Norman Collie sought for two seasons to discover where Mount Brown and Mount Hooker, which have long held a lofty place in the geographies, really lay, and whether they reached the height of 16,000 and 18,000 feet ascribed to them. While proving the existence of grave errors with respect to the peaks in question, he incidentally came across some magnificent summits between the source of the North Fork of the Saskatchewan and the Athabasca. The next ten years will probably see much climbing and map-making in this region. By exploring and keeping pace with other explorers, Mr. Wilcox has made his 'Rockies of Canada' the standard work for at least some time to come.

—In volumes lxvii. and lxviii. of the 'Jesuit Relations' (Cleveland: Burrows Bros. Co.) the documents are numerous, and relate to settlements which lie scattered over New France from the Saguenay to New Orleans, and from Acadia to the Mississippi. The period covered, 1716-'36, was one of rapid decadence for the Indians, and their decline can easily be traced in the reports of the missionaries. For instance, at Tadoussac, where there had once been a settlement of nearly three thousand men, only twenty-five families remained in 1730. Disease had been rampant, the savages no longer dared to put out from shore after the seal, and the sedentary life had lost its attractions. If, among the Montagnais, miseries of all sorts abound, the case is no better with their former scourges, the Iroquois. Those of the Caughnawaga Mission are said to improve in their singing, but at home they "are visibly on the decrease, on account of their incessant quarrels and the use of intoxicants supplied by the English." One sign that the Iroquois are losing their fangs is their willingness to use the Huron speech when repeating the services of the church. At Caughnawaga they actually prefer it. More and more the centre of interest shifts from the St. Lawrence and Hudson to the Mississippi, and even to the lower Mississippi. While the northern tribes dwindle, Louisiana becomes prominent, and in these volumes it takes a leading place. Towards the end of 1729, the Natchez Indians murdered over two hundred French who had settled in their midst. A minute description of the tragedy is given by Mathurin le Petit, who also enters fully into the usages of the tribe and the subsequent alliance between the Choctaws and French for revenge. According to him, the Natchez Indians possess a more regular kind of worship than exists among any other race of the aborigines. They are sun worshippers, and have a temple elaborately fitted out. "The great chief of this nation, who knows nothing on earth more dignified than himself, takes the title of brother of the Sun, and the credulity of the people maintains him in the despotic authority which he claims." Despite the relative superiority of their religious system, the Natchez were not remarkable among the southern tribes for their prowess, and the French, with the help of their native allies, had little difficulty in recapturing the women who were taken at the time of the massacre. At the close of the old régime, one casts about in vain for a really vigorous tribe or confederacy among the North American Indians. The wonder is that Pontiac should have made so much trouble for the English as he did, with the shattered tribes at his disposal.

—The proposal of Prof. Karl Breul, professor of German in the University of Cambridge, England, that the German Government establish in London an institution for German teachers of English, is a much wider-reaching proposition than at first sight appears. As thus presented, the scheme seems to be merely pedagogical in its intent; but it is pretty safe to say that its commercial aspect is the one which will appeal most strongly to the German Government. For the Germans have not been slow to realize that successful competition with England in English markets means to understand the art of supplying English wants in an English way, and that competition with England in the field of her foreign markets means the learning of English methods of production. A great deal of the German enthusiasm for the study of a culture which in its beginnings is intimately related to their own, and of a speech which is closely allied to their own tongue, has received aid and support from a long-headed German shrewdness only now coming to be recognized as somewhat dangerous to England's commercial supremacy. It will not be strange, therefore, if this, which seems on its surface to be a mere academic proposition, based upon such considerations as have led to the founding of the German archæological institutes in Rome and in Athens, will soon be an accomplished fact. Whatever be the economic results of the step, its effect upon German scholarship in English (a matter which Professor Breul has always shown the deepest concern for) cannot be anything but beneficial. For Germany, with her conspicuous devotion to scientific methods of English study, has all along betrayed a somewhat lamentable lack of appreciation of New English habits of thought—a lack which, while it is not apparent in the work of the best German scholars, is plainly manifest in the products of German teaching which come to us in the way of doctoral dissertations. A more intimate contact with the life and speech of England on the part of young German students of English cannot fail to improve German scholarship in this particular. We therefore cordially welcome Professor Breul's proposal, and hope that the German Government, whether it acts upon prudential motives or upon the higher one of sound scholarship, will soon put it into practical operation.

—So far as we know, no branch of the Government has supplied its medical or other officers sent to the Philippines with any particular advice as to the peculiarities of the diseases to be found there, or with suggestions for their avoidance or treatment. Nor is there any school of tropical diseases in the United States, although such a specialty will surely be added to the higher medical colleges when it is settled that there will be a permanent assignment of the Filipino burden to the superior race. As it stands, our medical service has not been specially equipped except so far as it is known that the regular medical officers, both afloat and ashore, are unusually well educated for all-around work, and the volunteers have at least been examined up to a fair standard. But a large part of the daily service in the field and in the hospital must necessarily fall upon the physicians under contract, to whom, although they are selected as far as possible from an excellent class, extreme tests cannot be applied. It is to be regretted that some concise and authoritative selection of medical information, especially applicable to the regions whither so many of our citizens have been sent as strangers, has not been supplied, at least for information if not formally for guidance.

—These remarks are induced by a paper on "Medicine and Disease in the Philippines," by Dr. David J. Doherty of Chicago, reprinted from the *Journal* of the American Medical Association of June 16. It is a brief compilation from a dozen writers, chiefly from the 'Estudia para una Nosologia Filipina,' by Dr. Enrique M. Barcones of the Spanish Navy, which was the result of two years' intelligent observation. The essence is that the continued heat and moisture lead to muscular lassitude and weakness, and to curtailed respiratory action, and that these effects in turn become causes. Dr. Doherty is entirely correct. Many diseases in the Philippines, unlike those in temperate climates, have no spontaneous tendency towards recovery, and in those where suppuration sets in there is a steady downward course until actively arrested. This is particularly true of tuberculosis, which is very common, and it rapidly assumes in the stranger an acute form that carries him off with astonishing rapidity. The initial malarial disease is not generally severe, at least in Luzon; but the victims of Cuban infection quickly break down, and certainly a year should elapse after their apparent recovery before they venture to the Asiatic field. Yellow fever is one of the serious diseases from which the Philippines are exempt, but Manson's warning should be heeded that, after the Isthmian Canal is open, there will be great risk, at least to the white races, that it may be carried direct from its Central American habitat. Dr. Doherty refers to the University of Manila as probably having sent forth a supply of physicians for many years, if not for generations. Under the Spanish régime, the course of study embraced six years, beginning at a tender age, and culminated in a degree corresponding to the baccalaureate, when the graduates became *practicantes*. To obtain the doctorate required attendance at and authority from the University of Madrid.

COBBOLD'S INNERMOST ASIA.

Innermost Asia. Travel and Sport in the Pamirs. By Ralph P. Cobbold (late Sixtieth Rifles). Charles Scribner's Sons 1900. Pp. xviii+354.

It would be interesting to know what Mr. Skrine of 'The Heart of Asia,' which we reviewed some little time ago, thinks of Mr. Cobbold and his book. What Mr. Cobbold thinks of Mr. Skrine and *his* book can be under no manner of doubt if we identify him—and that, too seems subject to no doubt—with the "gentleman of reputation," on p. 253, "who has recently paid a visit to Turkestan," and been wofully hoodwinked and crammed by his Russian cicerone. And, indeed, the books are above all interesting in their utter divergence as to the characteristics of their writers, and as to their methods and their results. To Mr. Cobbold, Mr. Skrine would be a "political," more exactly an "ex-political"; and therewith all would be said. Mr. Skrine, on the other hand, might deplore in Mr. Cobbold a lack of training in social problems and in history, and, above all, a lamentable insularity of attitude and narrowness of mind. He might possibly be sarcastic towards Mr. Cobbold's weakness for Byronic rhapsodies on nature and solitude, and for quotations from Thomas Moore, but we trust not. Those things ring true in him if they seem simple-minded to the most of us now, with our involved introspections in the presence of the Mighty Mother.

Mr. Cobbold went up into the Pamirs, as a healthy young sportsman may, in search of big game. He found his big game, and tells us about it at length in a straightforward fashion. He photographed, too, right and left—among other things, an *Ovis Poli* alive; but he does not tell us that this gigantic mountain sheep got its name from Marco Polo. Many of the photographs which he gives are very striking and beautiful, only it is a pity that the process reproduction has not done justice to their details. Some of them, also, are puzzling and suggest manipulation. On p. 45 there is one of an *Ovis Poli* supposed to be alive, but within three feet of it there is what seems to be a sheep dog looking down on it benevolently. Another, of "some twenty Chinese Sepoys riding towards me" in hot pursuit, is a very calm procession of about thirteen photographed from the side. But up in the mountains our author found other things besides big game. He found Russia there; and the impression which Russia and things Russian gave him was by no means pleasant. Most of the things which he learned, his experiences and sensations, he gives in his book, but not all. Certain facts seemed to him to be of too great political importance to be openly circulated. This sounds ominous, and on p. 230 there is another ominous remark on the dogmatic ignorance of "a certain official, a very big man high up in the service," whose name is withheld "for the present." Other facts which he does give might, perhaps, have been better away—better, that is, for certain people. The Russians will not love the Mimbashi of Roshan when they know how intensely hostile to them he is, and how he would welcome the English. Nor will Kevekiss, the Russian commandant at Charog, be helped with his superiors by the account of his sayings and doings here. Mr. Cobbold is evidently a young man still, and has probably a good deal to learn about official possibilities, subjective and objective, and official difficulties and responsibilities, but there does not seem to be any question that he entered on his trip with a mind at peace with all men, and principally occupied with his rifle and camera, and that he has returned a thorough-going Russophobe, with a store of facts Russian and a mission to see that they are known.

Starting from Srinagar, his route lay over the Gilgit military road to Hunza-Nagar; thence by the Kilik pass and the Tashdumbash Pamir to Tashkurghan in Chinese Turkestan, and on to Kashgar. Kashgar, a city of merchants, is described at length, with its motley population—the Sarts and their Chinese rulers; the Russian Consul-General, who, in turn, rules the Chinese Governor; and the British representative, who is not even a vice-consul, but is called "Special Assistant to the Resident in Kashmir for Chinese Affairs," and who rules nobody. Then from Kashgar into Russian territory over the Ţurgart pass to Vierny; from there to Lake Balkash, where a Central Asian tiger was bagged; back to Kashgar, and from thence out again for another campaign in the Pamirs, this time on the Russian side. The route lay through the Geez defile, and over the Kara Art pass to the Great Kara Kul in Russian territory; from there deviously to Tashkurghan on the Bartang, and down the Bartang to Kala Wamar. The last is ground known, among Europeans, to Russians only; the Oxus at this point and Roshan and Shignan have been practically inaccessible since their occupation. So Mr. Cobbold found. At Kashgar he had received through the Russian Consul-General a pass permitting him to travel and shoot in the Russian Pamirs, but his movements, coupled with the Muhammadan outbreak in Ferghana, which took place at the time, roused official suspicion, and at Kala Wamar he was arrested. For several weeks he was kept there and at Charog, a Russian fort established in 1896, opposite Kala Bar Panja, but eventually his bona fides became plain, and he was permitted to return to Chinese Turkestan by way of the Bartang and the Kara Art pass. From there he zigzagged down through the Oi-balgin pass, the Rang Kul Pamir, Tagharma, and Tashkurghan, visited the source of the Oxus in the Wakhan Pamir by the Wakh-jir pass, and finally returned to Kashmir over the Mintaka pass, Misgar, and Hunza. The return was by no means easy. It is the policy of the English Government to discourage all travel on the northern frontiers. This is apparently to avoid possible complications with Afghanistan, Russia, or China. So it was with difficulty that Mr. Cobbold had received permission to go north on the Gilgit road in the first instance; and now, he was delayed long both at Hunza and at Gilgit before he was allowed fairly to go back into India. On the route as a whole it may be remarked that several points are left rather vague, Mr. Cobbold not being exactly a geographical specialist.

As has been indicated above, this is by no means an orderly treatise on Central Asian affairs. It is an unsystematic record of how the situation there struck an onlooker whose main interests were elsewhere. But, for all that, there is great value in it for the careful reader. What precisely is the Russian wish and hope in the advance movement? Not, it may be noticed, the attitude of the Tsar or even that of the St. Petersburg officials generally, but that of the men on the spot. Again and again the hand of the central Government has been forced, willingly or unwillingly, by a daring rush on their part, and it is probable that we shall see something of that kind very soon both in Mantchuria and in Chinese Turkestan. Mr. Cobbold's testimony is that of all travellers in Central Asia who have not been officially and personally conducted. The whole Russian system, military and civil, leans eagerly forward. Russia's boundary at the least is to be the Hindu Kush with its continuations westward: Wakhan, Badakhshan, northern Afghanistan, Persia, and Baluchistan must all fall to her, and she must control the Persian Gulf. Thus the Oxus boundary is not regarded as of any permanent validity, nor that recently laid through the Pamirs. As an illustration, the English occupation of Chitral did not come a day too soon. It is well over the Hindu Kush, yet the Commandant of the Pamirsky post had received definite instructions to seize it; they came just too late. The authority for this was Kevekiss himself, who has at Charog a careful spy system and agents communicating with Cabul, Chitral, Yasin, and Gilgit. At present—this on the authority of the Mimbashi of Roshan—there is an intrigue going on between the Amir of Bokhara and the Badakhshani and Tajik subjects of Afghanistan on the left bank of the Oxus. The Russian Minister of War has given him five years to persuade them to throw off their allegiance and declare themselves Bokhariots. Then, of course, the boundary will move.

Everywhere among the Muslims, Mr. Cobbold found a strong anti-Russian sentiment. Such a feeling is natural in itself, but he ascribes its depth to the corruption of the officials and the confessed system of bribery which their low pay has brought about. The Muslim attitude towards the English Government is different. They are, of course, unbelievers and dogs, sons of dogs; yet under them there is no *zulm*, but even-handed justice, which cannot be bought. He is convinced that, in the final struggle,

> "that dreadful battle drawing nigh,
> To shake the Afghan passes strait and sheer."

the whole Muslim population of Asia will take the English side. The Bokhariots may hate the Afghans; the Amir of Afghanistan, who is like the Emperor of Austria, in that his death will bring the deluge, may coquette with Russia and secretly help the Afridis; but, in the last issue, they will all turn to England, especially if England has the support of the great Sultan of the Muslims at Constantinople. There the key to the Eastern question still lies.

On commerce, agriculture, mining, and manufactures, Mr. Cobbold has detailed appendices of much value. It is all a matter of communications, and until the railway system is more developed, the country cannot be opened. At present there are practically no mines or factories to speak of, and no opening for capital till connection is made with the great markets. He laments especially the policy of the English Government in shutting the Hunza-Nagar route to Kashgar (a commercial centre of the first importance, with five or six miles of shops), and thus ruining the Indian trade with Chinese Turkestan.

Criticism of the details of such a book as this is hardly in place. Its origin was not in the study among dictionaries and encyclopædias, but in the saddle and the *yourt*; on mountainside and glacier. Yet it cannot but be a surprise that one who has lived so long and intimately among Muslims should know in some ways so little about them. They are "Mussulmen," and "pilgrimage to the shrine of the Prophet"; the ordinary *mut'a* marriage of Shi'ites is not recognized (p. 76), nor is the story of Ali and his sons, Hasan and Husayn (p. 169). The sound and the translation of the call to prayers are given on p. 192 in the most fearsomely original form we have ever seen even of that much-enduring formula. More serious is a snap judgment (p. 291) on the Chinese commercial morality; other competent observers have rated it much higher.

Besides several smaller maps, the book has the magnificent one of the Pamir constructed for Lord Curzon in 1896. It is on a scale of 1:1,000,000, and extends from Chilas on the Indus to Osh, and from Badakhshan well over Yarkand.

The Jeffersonian Cyclopædia: A Comprehensive Collection of the Views of Thomas Jefferson. Classified and Arranged in Alphabetical Order under Nine Thousand Titles, etc., etc. Edited by John P. Foley. Funk & Wagnalls. 1900. 4to, pp. 1009.

Works like this of enormous drudgery can seldom receive a proportionate expanse of praise. The task was worthy; it has been executed with intelligence; its utility is unquestioned—this judgment might be conveyed in many words, but who would be the gainer? A dictionary is a mass of items arranged on some rational plan. The merit of such an one as this lies principally in selection. What Mr. Foley has virtually done is to translate all existing indexes into the choice passages for which a student or admirer of Jefferson would naturally resort to such indexes. If the context is wanted, it can be readily procured by following up Mr. Foley's references, which are scrupulously specific. The extracts are dated. In the case of letters, the correspondent is named, and the place where Jefferson was writing. There is a topical index with cross-references; there is a Jeffersonian chronology; and finally an appendix embraces sundry state papers, including the Declaration of Independence (whose "inalienable rights" were *un*alienable in the first draft), the Preamble to the Virginia Constitution, the Bill for Establishing Religious Freedom, the two Presidential inaugural addresses, etc., etc., and, nearly in full, the correspondence touching the reconciliation of Adams and Jefferson. Nothing more need be added to prove the value of this dictionary as a work of reference.

It is a repertory of Jefferson's own words at first hand. Hence it is by exception that Mr. Foley quotes, in a brief footnote, from Webster's report of Jefferson's interesting conversation concerning Patrick Henry; and we can but regret that he did not add to the testimony to Henry's weight as a leading revolutionist the few lines regarding the magic of his oratory, in the same conversation: "When he had spoken in opposition to my opinion, and produced a great effect, and I myself been highly delighted and moved, I have asked myself, when he ceased, 'What the d——l has he said?' I could never answer the inquiry." Jefferson's autographic account of Henry's oratory is duly excerpted, but with what seems a needless division. In place of "Oratory," we have "Eloquence" and "Force of Oratory," and these are two of no less than twenty-two separate entries under Henry. Some of these rubrics are by no means pat, and the alphabetical order offers no advantage over a logical or even chronological-biographical arrangement. "Declined office" and "Mysterious" would never naturally be sought by any user of the dictionary; "Brilliant but illogical" as little, while, what is more, it conceals a significant characteristic, for the passage in question relates that Henry "could not draw a bill on the most simple subject that would bear legal criticism." A logical ordering would have placed first the sketch of Henry's early manhood, and all the subtitles might have been dispensed with, even if the numbering of the paragraphs was retained.

Our example shows that Mr. Foley, in the wide range he has allowed himself, as was proper in the case of a man of such varied interests and occupations, has not neglected Jefferson's portraits of his contemporaries. The ready divination of Webster's power at their sole meeting is thus retained. But another coming man, dreaded as a Yankee and a religious propagandist, Lyman Beecher, has been omitted, though the passage in which he figures is as Jeffersonian as anything in this great volume. We have already cited it in our notice of Ford's edition of the Writings. Jefferson's sensitive but ineffective conscience on the subject of slavery is illustrated by sixty-six items, filling more than seven pages of the dictionary. War, in the abstract and the concrete, has one hundred and six, beginning (in a letter to Elbridge Gerry, 1797) with, "I abhor war, and view it as the greatest scourge of mankind," which is followed immediately by this (to Humboldt, 1813): "The insulated state in which nature has placed the American continent, should so far avail it that no spark of war kindled in the other quarters of the globe should be wafted across the wide oceans which separate us from them." One hundred and twenty-four items relate to Government. And so we might go on.

Very important is the matter of accurate transcription, and such comparison as we have made disposes us to place the highest confidence in these extracts as a true text, perfectly safe to adopt in all essential particulars. In No. 6349 we detect an *as* of some rhetorical importance dropped before "gradually"; in No. 7298 the phrase "in practice also" should be italicized to agree with Ford and with Jefferson's probable original; in No. 7297 the Italian proverb is rendered grammatical by changing *muove* (Ford) to *muova*—a possible infidelity to Jefferson, but a kindness to those who may quote him. Such trifles hardly deserve mention; nor do the occasional starred omissions, as in 7299, where no space, even, is gained by dropping a personal parenthesis. Everywhere it is manifest that Mr. Foley's intention is to reproduce loyally, and that he has spared no pains. He should have his reward.

It remains to add that the Dictionary is provided with nine portraits of Jefferson and a view of Monticello, a brave array.

Notes on a Century of Typography at the University Press, Oxford, 1693-1794. With annotations and appendixes. By Horace Hart, Hon. M.A., Printer to the University, and Controller of the University Press. Oxford: Printed at the University Press; New York: Henry Frowde. 1900.

When John Fell, Dean of Christ Church, in 1670 occupied himself, in his indefatigable way, in importing types and founders from the Continent for Oxford, he may have left unsatisfied the perplexity of him who wrote,

> "I do not like you, Dr. Fell;
> The reason why I cannot tell,"

but he established a valid claim to the liking of posterity. For he, in conjunction with Francis du Jon (*alias* F. Junius), then laid the foundations of the University Foundry as it exists to-day. The matrices he gave are still preserved in their original boxes, and his Hebrew characters are still used for examination papers. In one particular his zeal was excessive: his haste to begin was such that he put up with the Dutch "height-to-paper," and this "accounts for the un-English 'height' of the Clarendon Press type, which has been a source of trouble ever since its introduction." And so with Junius's contribution: Mr. Hart notes (p. 73) that "the existing fount [of English Swedish], originally [1677] Dutch "height-to-paper, was, in 1887 (with the exception of about 3 lbs. of type still preserved as a curiosity), reduced at Oxford to the Learned Press 'height-to-paper,' to bring the fount into use again." Between the latter standard and the Bible Press height there is an intermediate fount of English Etruscan, and between the London and Bible Press standards a fount of Arabic.

Mr. Hart's fascinating but laborious task was to reproduce the Oxford Specimen books (or sheets) of type, etc., in the period named in the title, so far as they exist; and to combine with this an inventory of such of the stock as has come down. The scheme employed has been most judicious. The facsimile has, where possible, been effected by reëmploying the original type, even by casting anew from the matrices, sometimes by adaptation to fill a gap. Only when necessary has a process plate been resorted to. At every step, Mr. Hart states his procedure, and traces the history of the founts, etc., while reporting upon their actual condition. It is surprising with how much interest he has been able to invest this portion of his undertaking. Sometimes he improves on the Specimen, as in the case of the flowered letters shown on p. 113, where he gives thirteen instead of three; and on pp. 114, 115, eighteen for two. Both series were deeply cut in boxwood, and in the second series, by inverting the L, he shows an engraving of a man's face as grim as his own facetiousness in noting, "The artist, although he did not inscribe his name, may have intended to produce his portrait to be handed down to posterity."

The first Specimen, of 1693, is recorded entire; the rest only as they are supplementary. Not a few of the finer founts from the earliest date have recently been cast anew and used in works issuing from the University Press, so that to a certain extent Mr. Hart has provided a new Specimen Book. One feat of this kind is worth reporting, apropos of the Sclavonian, Great Primer (p. 57):

> "As the University of Oxford was the first in England to use Slavic type for printing books, in the year 1695, so now [1893], after a lapse of 200 years, the same University, in celebrating with the invincible prince and people of Montenegro the earliest style of printing among the Servians, has printed the Lord's Prayer at the same Press and in the same type."

As early as 1768 the youthful Bewick had cut diagrams on wood for Dr. Hutton's 'Mensuration,' and for more than ten years before 1794 he had paved the way for book illustration by wood-engraving. Except initial letters, however, none of the century Specimens enumerate any woodcuts, the latest, of 1794, naming only copper-plates, among them three heads of Lord Clarendon, whose name is first attached to the Press ("Clarendon Printing-House") in the 1768 Specimen, though old Hearne had deplored the appellation on October 28, 1713.

> "This Morning," he says, "the Printers began to remove from the [Sheldonian] Theater to the New Printing-House just erected, w^{ch} is (it seems, out of a Whim) to be called Typographéum Clarendonianum, and Archb^{p} Sheldon is to be forgotten, as a Benefactor to the Oxford Printing, if People will comply with this Whim."

Another innovation in this Spêcimen was the appearance for the first time of the capital U on the title-page in place of V in Vniversity. It first catalogued, too, bastard type—that is, type whose face was larger or smaller than the body on which it was cast; and in its 1775 supplement are shown examples of pages set with "type with a permanent distance," dispensing with leads. It further shows that the Press had begun to purchase of Caslon and Baskerville. New-face type came in with the 1794 Specimen, along with the "Quousque tandem" selection.

Three appendixes contain much curious matter. One shows old devices and ornaments (still available) and various founts not listed in any Specimen; among them, examples of French castings with nick behind, and the English front nicks supplied by machine cutting. There is a Greek fount cut in 1803 by Vincent Figgins. Greek ligatures, we are told, were abandoned about 1816-1820. Appendix II. exhibits impressions of ancient wood-engravings equally unrecorded. Appendix III. consists of correspondence with Samuel Clarke, first Printer to the University, Dr. Fell, and others, relating to the beginnings of the Press, and is good reading for a student of the art and craft. It also embraces a valuable comparative table of Dutch, French, German, and Oxford type-bodies, with their equivalents in Didot points (whose general adoption, by the way, is naturally overestimated by Mr. Hart's French authority).

The beauty of this folio volume is a delight to the eye, and it is, unhappily, intended for the eyes of only one hundred and fifty possessors. The total product is an honor to the Press, and Mr. Hart's part in editing, composing, and printing it is beyond praise. His painstaking has shrunk at nothing except an index.

A Book for All Readers: Designed as an aid to the collection, use, and preservation of books, and the formation of public and private libraries. By Ainsworth Rand Spofford. G. P. Putnam's Sons. 1900.

Dr. Spofford has collected into this pleasant and useful volume much of the book-wisdom and some of the book-wit gathered during his long experience as librarian-in-chief of the Congressional Library, which he, after years of struggle, has lived to see worthily housed. We have here information as to the acquisition and proper care of books, the management of a library, and all things of special interest to book-lovers; the whole enlivened by many curious particulars and some facetious remarks.

In forming a library of general reading a question which is sure to arise is that of novels. Here Dr. Spofford is wisely conservative. A subscription library that must cater to the public taste in order to exist may be obliged to load its shelves with worthless fiction; but for an endowed library it is sufficient to have a fair representation of each important class of contemporary novels. The function of the library is to instruct and improve, not to furnish amusement. And as the appetite for incessant and indiscriminate novel-reading seems to be growing to a disease, the librarian who properly feels the importance of his calling will at least avoid pandering to it.

An interesting chapter is given to the enemies of books, chief of which are dust, damp, overheating, gas, insects, mice, and thieves. With brushes, ventilation, electricity, poison, and traps the librarian can deal with the lower degrees of the scale; but to escape the book-pilferer, short of the heroic remedy of "keeping a man standing by each book with a club," is a difficult problem where the public has free access to the shelves. We are pained to learn from concurrent authorities, that this is a weakness to which clergymen seem especially prone. The late Dr. Poole, the Chicago librarian, found ministers "more remiss" in this respect than any other class; and when, as we are told, the remissness went to the extent of removing the book-plates and library stamp, and concealing the alterations by pasting in new linings, even charity can hardly attribute the dereliction to absence of mind.

With Dr. Spofford's suggestions for dealing with that torment of the librarian, pamphlets, we cannot entirely concur. When all that are of consequnce have been bound, singly or collectively, or filed in pamphlet-cases, there will always remain a mass of miscellaneous pamphlets which seem to have no value, yet any one of which somebody, at some time, may want to see. To tie these up in bundles or heap them in piles in a cellar or garret, is little better than sending them to the junk-shop. A better plan, we think, is this: Have a room, if possible—if not, a set of shelves—devoted to miscellaneous pamphlets. Give each pamphlet when received an accession-number written in bold figures on the front cover, and place it on the shelf in the order of its accession, irrespective of date or subject. Guide-numbers, at intervals of 20 or 25, can be placed on the edges of the shelves, or guide-cards between the pamphlets. The accession-series should be distinct from that of the main library, and there is no need of an accession-book. Catalogue briefly under the subject (in either the general or a special catalogue) with a symbol to indicate that the number refers to miscellaneous pamphlets. The reader who finds from the catalogue that the library has a pamphlet on the subject he is studying, gives the number to the assistant, who by the guide-numbers on the shelves can lay his hand on it in a few seconds.

One of the most interesting chapters in the book is devoted to binding, of which the various processes, styles, and technicalities are clearly explained. Hints to readers not accustomed to great libraries, and to librarians how to help such readers, are also given, with some remarks on the art of finding references and quotations.

Rare books are discussed, and due warning given to the inexpert buyer not to be deceived by "very rare" or "unique" in catalogues. Putting incunabula aside, no book is necessarily rare because it is old. But if he should be the lucky possessor of the Latin Psalter of Fust and Schoeffer, 1459, it may interest him to know that a copy brought £4,950 at the Syston sale in 1884, being the highest recorded price for a single printed volume. Or if among old rubbish in his garret he finds a copy of the 'Bay Psalm Book,' 1640, let him not part with it lightly, for it is worth over a thousand dollars.

The Causes of the War of 1792. By J. H. Clapham, M. A., Fellow of Kings College, Cambridge. Cambridge (Eng.). University Press; New York: Macmillan. 1899.

Opinion regarding the broad ideas of the French Revolution will, naturally, change with the sentiments of each succeeding age. But what shall be said regarding all our new knowledge of the facts of the Revolution? If any one thinks that history is unprogressive, let him place side by side our present information concerning the affairs of France from 1789 to 1815, and that which was available to Mignet, Thiers, and Lamartine. Without indicating all the points of advance, one may say that nowhere has change of view been more noticeable than in what relates to the diplomatic history of the early Revolution. Among the assumptions of a former age, none had a show of greater certainty than that which represented the foreign policy of France, 1791-95, as wholly irregular, and, like everything else, revolutionary. However, within the last twenty-five years a marked change of attitude has taken place. Mr. Clapham describes the current tendency when he says:

> "The school of French writers which has devoted itself to the study of the unity of national life, and to the undermining of the cataclysmic theories of the Revolution, is rapidly laying bare the points of contact between the diplomacy of the Revolutionary leaders and that of the statesmen of the old order. As a result of their work it is becoming increasingly necessary, in the study of the great wars, to lay stress on the influence of ancient diplomatic traditions and ancient international rivalries."

Mr. Clapham's book springs from a prize essay, the Prince Consort dissertation of 1898. Like other republished prize essays, it has been enlarged since it served its first purpose, and it now makes a volume of moderate size. According to the regulations for the award, "original research" is the touchstone to which each essay offered in competition must be brought, and in Mr. Clapham's case there is proof that Lord Acton's régime at Cambridge has prompted patient and impartial study at first hand. Mr. Clapham is widely read, is accurate, and is thoughtful. The more important strictures which we feel bound to pass upon the quality of his work are but two in number. He occasionally writes a sentence which must be read a second time before its full meaning is apparent, and he is a little overcautious about committing himself to an opinion. So far from finding any trace whatever of dogmatism, one would welcome a little more directness and incisiveness at points where a well fortified historian should make his position clear.

Mr. Clapham begins by sketching the general relations of France with other European states at the outset of the Revolution, and really closes with April 20, 1792, although a chapter of epilogue carries the narrative forward by another three months, or until the Duke of Brunswick's proclamation. Pitt's consistent neutrality during the period prior to the regicide renders the part of England a slight one in such a study as this. Accordingly, Mr. Clapham can give almost all his attention to the policy of the Continental courts, particularly to those of Vienna and Potsdam. St. Petersburg, Madrid, Stockholm, and Turin fill a place in the near background, while afar off one can catch a glimpse of the Sublime Porte. Two governments, and two alone, acted between 1789 and 1792 from a sense of conviction. England and Sweden both had a settled policy. The one was throughout neutral, the other hostile to France. Spain, under Florida Blanca, was also hostile at heart, but had no courage to express her true feelings. The other states temporized for over two years, not by reason of apathy, but because the motives which appealed to them were so many and so varied in character.

Austria, of all the Continental Powers, suffered the most from the wars of the Revolution. There is a Hindustani proverb to the effect that it makes little difference whether the knife falls on the melon or the melon on the knife: in both cases it is the melon which gets damaged. So it proved with Austria from Valmy to Wagram. When we think what these wars cost the Hapsburg provinces, the attitude of the Viennese Foreign Office towards the Legislative Assembly takes on a special importance. But even without looking into the future, the policy of Leopold and Kaunitz is more remarkable than that of Catharine or of Frederick William II. Let us glance at what Mr. Clapham says concerning the development of Austrian hostility to French radicalism.

At the moment when the States-General met, the leading factors of the situation, from the Hapsburg standpoint, were as follows: Austria and France had been, in spite of much murmuring on the part of the French, fast allies for more than forty years; the Emperor's sister, Marie Antoinette, was married to the King of France; Prussia and Austria regarded each other with mutual suspicion; and, for the sake of providing a safeguard against Prussian greed of territory, Austria had joined Russia in a war against the Porte. The Polish question also remained unsettled. Like the majority of sovereigns,

hought at first that the Revolu-
ld merely weaken France, reducing
haps, to the rank of a second-rate
Despite the old alliance of the
Years' War and the recent marriage
tion, he cared little for the political
ps of Louis XVI. So long as govern-
in France did not yield to anarchy,
ould view with pleasure any weakening
the royal prestige. Moreover, he had
long before been the reforming Grand
ke of Tuscany, and looked with some
vor upon moderate liberals. What Aus-
ia needed was peace. She joined in the
Turkish war only to please Russia, and she
would have welcomed the preservation of
the *status quo* in Poland. Here her worst
dread was that Prussia and Russia would
annex fresh portions without giving her
just compensation.

Leopold thus had strong motives for letting affairs work themselves out at Paris, unmolested by him. What led him, and eventually Kaunitz, to favor the declaration of war for which the Brissotins and the Comte de Narbonne also longed? Was it fear that France might encourage the Belgian revolution? Or that she would not act fairly towards the Elector of Trier and the Rhenish princes of the Empire? Or did the Comte d'Artois and the emigrants make an impression at Vienna? We feel confident that none of these partial motives can account for Leopold's change of front. Indeed, so far as the emigrants are concerned, he had a hearty dislike of them. The real causes of his final resolve to fight the Revolution were a growing dread of its doctrines, alarm for the safety of Marie Antoinette and her husband, a belief that the Legislative Assembly could easily be browbeaten, and the certainty of securing Frederick William II. for an ally.

Mr. Clapham's monograph contains comparatively few theories, but very many facts. He advances by short stages, keeping the Powers in touch with each other at each stage. The history of diplomatic negotiations requires great fulness of detail, and so many shifting interests were involved at every court that we have only attempted to say a word about Vienna. But we must express our pleasure at the just censure which Mr. Clapham metes out to Von Sybel for judging the political morality of Prussia by a far less rigorous standard than that which he applies to France. This is a valuable study, and we hope that it may add freshness to more than one university lecture.

of Electrolytic Dissociation, and
ations. By Harry C.
pp. 289.

lated atoms (not ordinary molecules) of sodium and of chlorine. But this was such a startling idea—it seemed so incredible that an innocent solution of common salt should contain such powerful reagents as nascent sodium and chlorine—that the theory found no acceptance, especially as the proposition did not seem to lead to any further correlation of facts.

In 1877 the botanist Pfeffer published a book (translated in Harper's Science Series) in which he gave the results of numerous experiments by him upon a phenomenon first discovered long before by Traube, that of osmotic pressure. Namely, when a membrane forms a partition between a solution and a quantity of the pure solvent, if it happens that the solvent can pass through the membrane, while the dissolved substance cannot, then the pure solvent will flow into the solution, until a certain difference of pressure has been established, called the osmotic pressure. Now Pfeffer's experiments showed that for dilute solutions of any given substance the osmotic pressure was proportional to the quantity of that solvent in solution—a fact which, if it attracted his attention at all, probably appeared natural enough to him, and to which he attached no particular significance. But one day, as the physical chemist Van't Hoff was going home from his laboratory, he met a colleague who had been repeating some of Pfeffer's experiments, and who mentioned to him the proportionality of the osmotic pressure to the concentration of the solution. To Van't Hoff's trained mind, this meant no less than that the dissolved substance had a pressure proportional to its density, or, in other words, was in a quasi-gaseous condition.

To many a man familiar with the kinetical theory of gases, this analogy would have seemed strained, because he would have regarded it as the essential characteristic of gases, to which the law of Bayle is due, that the molecules have rectilinear paths. The exacter conception of Van 't Hoff was that that law is the consequence, not of the rectilinear paths, but of the fact that the molecules are so far separated from one another that their mutual attractions and repulsions have no considerable effect. But now, according to the law of Avogadro, the pressure of a given gas must be the same as that of the same number of molecules of hydrogen in the same volume and at the same temperature. Was the osmotic pressure, then, of the right amount? After a preliminary inquiry into the applicability of the law of Charles, or Gay-Lussac, Van 't Hoff succeeded in showing that this was precisely true for many substances in solution, while for many others it was not at all true, the osmotic pressure in these cases being always too great. At this point Ar-
whose pupil Van 't Hoff had been,
ately been informed of his
ciation, remarked
olytes,

know in what state the dissociated atoms may be. Possibly, for example, they may be combined with atoms of the ether, which may be of different chemical kinds. But it does seem that chemical physics is now upon a path which may probably bring us out to a clearer view of the nature of atoms and of molecules.

Mr. Jones's book is, in some respects, not unskilfully put together. His argument is clear, consecutive, and convincing. We think his readers will generally regret that he has not placed before them more extended synopses of the facts, in lieu of a few at each point that have been selected as being favorable to the theory. It may be doubted, too, whether the representation of the doctrine of electrolytic dissociation as the pivot upon which all the physical chemistry of the day turns, is quite accurate in its perspective. The non-electrolytes are of a good deal of importance.

About a third of the volume is occupied with applications of the theory to physics, chemistry, and physiology. The most interesting of these have been before the English reader for some years—as has, indeed, the whole subject, though it has not before been so well set forth.

BOOKS OF THE WEEK.

Alleman, Julia S. Postmarked "Colima." Philadelphia: Lutheran Publication Society. $1.25.
Bain, R. Nisbet. The Daughter of Peter the Great. London: Archibald Constable & Co.; New York, E. P. Dutton & Co. $4.
Balfour, Marie C. Side Lights on the Reign of Terror: Being the Memoirs of Mlle. des Echerolles. John Lane.

The Nation.

NEW YORK, THURSDAY, SEPTEMBER 6, 1900.

The Week.

The Labor-Day speeches of Gov. Roosevelt and Mr. Bryan, delivered from the same platform, had much in common. Both orators were for an eight-hour day, both for trade unions, both for "sympathy" between capital and labor. If Roosevelt was the more platitudinous and egotistic, Bryan was the more partisan and inflammatory. The mischief lay not in any precise form of words, indeed, but in the latent suggestion, and in the inference which the turbulently inclined among his hearers will be certain to draw from his language. On the surface, his references to "government by injunction," for example, were unimpeachable. He but stated a legal proposition which has commended itself to some of the ablest members of the bar, and which we have not hesitated to approve—namely, that the employment of Federal judges to do the work which the local police power is entirely competent to perform, is a disquieting tendency of the times. As Mr. Bryan pointed out, the Senate voted unanimously for a bill aimed at the abuses of "government by injunction." But when all this is said, what, in pure fact, will be the conclusion which a hot trade-unionist will draw from Mr. Bryan's words? Why, that he, as President, would never interfere, as Mr. Cleveland did, to put down labor riots. It is not his words, but his character and attitude, that count in this business, and they distinctly count on the side of social disturbance.

Bryan maintains silence as to the policy which he would pursue, if elected, regarding certain phases of the silver question. The *Herald's* correspondent at Lincoln asked him, on August 27, whether he would make payment in silver on Government bonds that on their face call for "coin," and his only reply was, "Say Mr. Bryan declines to be interviewed on that subject." The next day the same correspondent put various other questions as to Bryan's course regarding the silver issue in case of his election, and could get no other answer than "I will discuss public questions in my own way and in my own time." Mr. Bryan is, of course, within the rights of a candidate in declining to answer questions which he does not feel like meeting, but it is a tactical mistake for a man who has always prided himself upon the frankness and boldness of his utterances regarding the financial question, to take refuge in silence. A noncommittal course will satisfy neither silver men nor those who believe in the gold standard.

Mr. Schurz's letter to Secretary Gage strikes straight at the joint in that gentleman's harness. In the interest of the Republican party, Mr. Gage had pointed out a loophole left in our monetary legislation, of which Mr. Bryan, if chosen President, could take advantage to imperil the gold standard. Very well, asks Mr. Schurz, why did you leave it? Simply as a very ragged remnant of a bogey wherewith to frighten the country again? Furthermore, Republican control of the finances will not cease, in any event, before next March. Is it to be supposed for an instant that McKinley and a docile Republican majority in Congress would fail to cure all defects in the Gold-Standard Law before Bryan came in? If they did not, they would not be the alarmed saviours of society that they profess to be. Yet if they should say now that they will do what they have the power to do, it would break down their laborious attempt to get up a panic. Secretary Gage spoke in the guise, not of a financier, but of a partisan.

Occasional complaints are made by old-fashioned people of the change in the character of the men who are now elected Senators of the United States. Senator Platt, it is said, is not qualified to maintain the standard established by such orators as Seward and Marcy and Wright and Evarts. He has not made a speech since he took his seat in the Senate Chamber, and the great questions of the day are decided apparently without his knowledge or participation. We recommend to such as are inclined to make complaints of this nature the perusal of Senator Depew's speech at the Republican Club on Thursday night. If they do not feel thankful that the State of New York has one Senator who can hold his peace, they must be very ungrateful people. It has been reported that the Republican managers have decided to make an incursion into the region east of the Bowery, and that Senator Depew has been chosen to lead the invading force. If he is to employ such arguments as he advanced on the above occasion, it is certainly well that they should be reserved for East-Side audiences. Intelligent people can hardly be expected to listen in patience to the assertion that European opinion favors the election of Bryan because it would mean the ruin of the United States. Four years ago, Mr. Depew says, European opinion was in favor of McKinley's election, for a selfish reason. Millions of American securities were held in Europe, and the holders did not want their value reduced by the overthrow of the gold standard. Now these holders have sold their securities and lost interest in our finances. But because they dread our commercial competition, they desire that we should be impoverished, and they think that Bryan's election would bring on a panic that would close our factories. It would be difficult to prepare a worse compound of economic folly and misconception than this.

A newspaper in Moline (Ill.) publishes a circular, said to have been received from an English life-insurance office, warning English insurers against taking policies in American life companies while the standard of value is endangered by the possible election of Bryan. The circular is headed, "Certainty vs. Doubt." It says that if Bryan were elected the life companies of America could not, if they would, pay their claims in gold, and that each £1,000 policy would be reduced in value one-half or more. It says also that Bryan lacked only 30,000 votes of being elected in 1896, and that he (Bryan) considers his chances much better now than they were then. The impression sought to be made on the minds of foreign applicants for life insurance is that American companies are unsafe by reason of danger to the standard of value. Of course, if there is danger to Englishmen, there is equal danger to Americans. Our companies would not make fish of one and flesh of the other, nor would the law let them do so if they wanted to. It is safe to say that few, if any, Americans are deterred from insuring their lives by any apprehension of Bryan's election. Business may be dull in life insurance as it is in banking and other trades, and the Presidential election may have some relation to it. All Presidential years are bad for trade. But any surety company could make money by insuring the holders of American life policies at half of 1 per cent. against all the dangers of bimetallism.

The Republican managers are very glad now that there was such a strong protest against Imperialism from Senators and Representatives of their own party during the last session of Congress. They find that ardent Imperialists of the Grosvenor type are not effective orators at Republican meetings in States like Maine, where the Expansion policy has from the first been regarded with much distrust. In fact, the Ohio Jingo had hardly begun discharging his diatribes against Boutwell and other Anti-Imperialists as "traitors" before he was notified that the managers did not think that they would need so many of his speeches as they had originally scheduled. On the other hand, the men whose support of republicanism counts most in this campaign are Senator Hale of Maine, who voted against the treaty of peace, and still says that he is not an Expansionist and never expects to be one; Representative McCall of Massachusetts, the Republican member of the Ways and Means Committee who led the movement against the Porto Rico tariff in the House last winter; and Representative Littlefield, the new member from Maine, who leaped into national prominence by asserting his independence of party dictation.

The disregard of American officers in the Philippines for the safety of insurgent prisoners, and the dubious character of the civil governments which have been set up under American authority, are strikingly illustrated by the case of Col. James S. Pettit of the Thirty-first United States Volunteer Infantry. While in command of the district of Mindanao and Jolo, Col. Pettit turned over to one Midel, a civil officer under his immediate control, one Juan Ramos, a reputed insurgent and agent of Aguinaldo. Once in Midel's hands and beyond the outposts of the United States troops, Ramos was promptly shot. For his action in the matter Col. Pettit was tried by court-martial and acquitted. In disapproving the findings, Gen. MacArthur, though restoring Pettit to duty, censured his conduct in strong terms. The accused officer admitted that Midel had asked to have Ramos turned over to him "for punishment," on the ground that "it was necessary to make an example of the first offender"; and there was evidence of record, although the court apparently did not give much weight to it, that the transfer of Ramos was made in pursuance of an agreement between Pettit and Midel that he should be killed by the latter. Under the circumstances, and with knowledge of the shooting of another insurgent leader who had previously fallen into Midel's hands, Gen. MacArthur very properly concluded that Col. Pettit's instructions had been issued "carelessly and negligently," and that he was guilty of disregard of the "elementary rights" guaranteed to his prisoner by military law.

The thirty cities in the United States having each a population of 100,000 or over show, according to the returns published by the Census Bureau, a combined population of 13,243,515, or about one-sixth of the probable total population of the whole country. The figures do not, of course, exhibit the actual massing of population at many centres, since cities like New York, Boston, St. Louis, Kansas City, and Omaha have adjacent to them large populations identical with them in interests, and separated only by an indistinguishable boundary line, but which, because of their distinct municipal organization, are separately enumerated. Of the thirty cities, Omaha alone shows a falling off during the decade, and the padding of the returns from that city in 1890 seems to be generally accepted as the correct explanation. While the rate of growth naturally varies much with different localities, it has been, on the whole, well sustained. It must be remembered, in this connection, that the growth of population since 1890 has been somewhat different from that during the decade 1880-1890. Since 1890 the country has not been swept by strong currents carrying large masses of population this way and that, and affecting directly the local conditions of increase. Immigration, too, has been much more strictly guarded, and the lowest classes of Europeans, who once flocked to us in droves, have largely ceased to come. Apparently, therefore, our growth in numbers, when the statistics are available for an analysis of it, ought to be found to have been of an encouragingly healthy sort. There seems to be no reason to think that the rate of increase in the cities will hold true also of the country, although the smaller cities and towns will very probably show relatively large gains.

What effect the increase of population, as shown by the twelfth census, is to have upon the size of the House of Representatives, will doubtless continue to be a fruitful subject for speculation until Congress itself settles the question. It seems to be generally assumed that the number of Representatives will be increased, as has been the case at each apportionment save that under the census of 1840, when the membership was reduced from 240 to 223. It did not reach the former figure again until 1860, when the number was 243. The next increase was large, to 293, followed by 325 in 1880, and 356 in 1890. The fixing of the ratio, and, consequently, of the number of Representatives, is, of course, an arbitrary arrangement, the only restraint upon Congress being the Constitutional requirement that each State shall have at least one Representative, and the accepted precedent that the existing representation of a State is not to be reduced. Just how many Representatives any State will be entitled to, whether under the present ratio or some other, cannot be figured out until the full statistics of population are available, which will not be until some months hence. It is apparent, however, that any considerable increase will seriously crowd the present hall of the House at Washington. So long as every member must have a desk and an armchair, the physical difficulties of properly seating the members must soon reach a climax. Resort to the custom of the House of Commons, where benches only are provided for members, would relieve the difficulty, and do away with the indefensible practice of using the desks in the hall of the House as places, not for attending to the business before the House, but for writing letters, preparing speeches, and reading newspapers. Compared with European bodies, the House of Representatives is not immoderately large, but if further increase is thought advisable, a better plan than the present for the accommodation of the members ought by all means to be devised.

Although the frequent insurrections in South America have accustomed us to thinking of that part of the world as engaged in chronic war, the reported action of Chili in establishing compulsory military service bodes ill for future peace. The inciting occasion, no doubt, is the determination of Chili to retain permanently the provinces of Tacna and Arica, which have been occupied by Chili since the close of the war with Peru, in 1883. That the action of Chili will operate to force similar action by neighboring States is evident. Peru has already revived a compulsory military service law dating from the war between that country and Chili, and the newspapers of Bolivia, Argentina, and other countries are earnestly discussing the matter. Chilian papers seek to justify the measure on economical grounds, the pay of the soldiers under the new requirement being only $8 a month, as against $25 a month now. As *El Pais*, a Buenos Ayres journal, points out, however, the only justification for compulsory military service is extraordinary military exigency, and such exigency does not exist in Chili at the present time. Moreover, Chili itself has nothing to gain from the change in the way of enhanced military prowess. Other nations will only follow the same course, with the result that South America will be in a state of armed peace, with all the financial burdens, economic disorders, and international dangers which such a régime involves. The situation certainly affords a striking illustration of the fatal tendency of militarism to reach beyond countries where its encouragement may be given a kind of plausibility, and plant itself in regions where its presence can be defended only on the most shadowy of pretexts.

Russia is forcing a withdrawal of legations and troops from Pekin to Tientsin, which would not only bring the allies nearer to their base, but leave an opening for the return of the fugitive Chinese Government, and facilitate the negotiations for a settlement. A sense of humor combined with good sense has brought about this step, for, as we intimated last week, the situation at Pekin was becoming ridiculous, provided there was neither the intention nor the ability to overrun China and hold her in subjection, divided or undivided. All the Powers disclaim such a purpose, and nothing else remained but to signify this by evacuating the capital, which had been invaded solely in order to rescue the Ministers. Moreover, if Count von Waldersee's nomination as generalissimo was as distasteful to Russia as has been represented, it was desirable to anticipate his arrival out by bringing active hostilities to a close. His promenade, which is really the German Emperor's, is therefore in danger of having a jocose termination, whether because he will find nothing to do, or because his authority can be contested on the ground that the conditions in view of which his appointment was assented to have passed away.

The semi-agreement between Russia and the United States is construed in England as a departure from the policy of the open door in China, and as a surrender of Mantchuria and North China to Russian trade monopoly. The contrary belief prevails here. Russia had pledged herself in writing to the open-door policy in China months before the Boxer troubles began. The two things were in no way connected with each other. The agreement as to trade did not depend upon anything that the Chinese Government or rebellious Chinese subjects might do. It was an understanding primarily between ourselves and Russia, but was of such a nature that other Powers, desiring to trade with China, might do so on equal terms, the door being open to all alike. Now comes the Boxer disturbance, or whatever may have been the inspiration of the attack upon the embassies at Pekin. Russia, the United States, and England are equally sufferers from this attack. They join to rescue their Ministers. The rescue having been effected, and the Chinese authorities having fled, Russia says that there is no reason why her Minister should remain in a place where there is no Government to communicate with. She proposes to retire, and resume negotiations whenever China shall have reëstablished an authority with which other Governments can deal. Nobody can find fault with this proceeding unless he is accustomed to look at Russia through the colored glasses of his own jealousy and fears. We are not under any disability of that kind.

The London *Times* says that if some of the Powers withdraw from Pekin, such action will not affect the duty or interests of the others. That is very true. No feelings will be hurt on this side of the water if England decides to remain in Pekin till a stable government is established there, or if other Powers remain there with her. Those who remain, however, will have to pay the bills after the others withdraw. There is no danger that England will set up any exclusive trade privileges or allow her partners in the joint occupancy to do so. So we can rest entirely easy on that score. One question of great perplexity will remain to be settled by all the Powers, whether their forces remain in Pekin or not, and that is whether they can ever again put their embassies in peril of siege in the Chinese capital, or whether they will be compelled to fix the residences of their diplomatic agents at some point on the seaboard where they will be under the protection of their own guns.

British annexation of the Transvaal has been a foregone conclusion ever since the Boer war broke out; yet it comes now as a very cold comfort to the English public. What was wanted was a speedier and more graceful yielding after the capture of Pretoria. Believing themselves so extremely unselfish and benevolent, Englishmen have wondered that the burghers did not more readily perceive the noble qualities of their conquerors. Both the Transvaal and the Orange River Colony, it is now clear, will have to be strongly garrisoned for a long time to come. The former country was easily conquered, after Paardeberg, but Lord Roberts soon found out that to conquer is one thing, to pacify quite another. Since the proclamation of annexation, burghers found with arms in their hands are technically rebels, and subject to hanging for treason. It is safe to say, however, that no English Government will hang them. Treason unsuccessful is, in this case, no longer treason. Disappointed as the British public is at the failure of the Dutch to fly to the arms of their conquerors, it still desires to see a policy of conciliation put into effect.

The full text of Mr. Labouchere's correspondence with Montague White only confirms the impression gained from the dispatches, that Mr. Labouchere's dealings with the Transvaal agent were highly honorable. Some months before war was declared, at a time when English public sentiment was much inflamed against the Boers, Mr. Labouchere counselled Oom Paul's people to have patience, to accept the commission forced upon them by Chamberlain, and to trust to time and a skilful presentation of their case to do them justice. In contributing to the discussion of the Transvaal franchise certain facts about the English naturalization laws, Mr. Labouchere did not commit the slightest impropriety. In short, all his efforts looked simply towards the maintenance of peace by means of discussion and conference. Mr. Chamberlain's action in making any point of these letters was singularly naïve. It gave Mr. Labouchere the chance to figure as an aggrieved person, and, worse yet, to stir up anew the unsavory matter of Mr. Chamberlain's dealings with the Transvaal—a chapter of diplomatic history that was sinking into kindly oblivion. For Mr. Chamberlain to suppose that the mere cry of "treason" would go down with the English mob was to commit the politician's unpardonable sin, of not "knowing his public."

Through the withdrawal of the Bulgarian diplomatic agent at Bucharest, friction between the Bulgarian principality and the Rumanian kingdom reaches the acute stage. The cause of the trouble was the maltreatment of Rumanians residents in Bulgaria by the Macedonian Revolutionary Committee. Persecution and blackmail of various degrees against Rumanians who opposed the work of the revolutionists, finally culminated in the assassination of a prominent Rumanian resident in Sophia. Demands for satisfaction and the speedy punishment of the assassins were met by demands for proof. Evidence that Bulgarians high in the official service were implicated in the crime greatly exacerbated Rumanian resentment, and provoked the threat of reprisal by the general deportation of the Bulgarians in Rumania. Bulgarian delays only made matters worse, and the final act, which is just short of a declaration of war—the sundering of diplomatic relations—comes from Bulgaria, the country morally the aggressor in the dispute. It appears that the Bulgarian revolutionists welcome the chances of a war, with its possibilities of Russian intervention and the annihilation of Rumania, the buffer state between the Russian Slavs and those of the Balkan States. It is surprising that Abdul Hamid should contemplate the situation with apparent serenity. But it is possible that the Sublime Porte has learned to accept resignedly the minor amputations, so long as the Turkish Empire, as a whole, is not laid on the operating table of the Powers—possible, too, that the Sultan is assured that the deluge is reserved for his successor.

Social Democracy has gained few legislative victories in Germany, but that it has profoundly leavened the German masses in the great cities was shown in the funeral ceremonies of William Liebknecht three weeks ago. It was to be expected that the Socialists of many lands would be represented at the obsequies of the great Socialist leader. The spontaneous interest of all Berlin in the event was, however, less expected, and more significant. Six thousand persons from Liebknecht's Parliamentary district preceded the body to the grave. In all, the funeral cortège is said to have numbered over 30,000, and the exercises of the day passed off in perfect order and with the utmost decorum. The solemnity of his last offices, though perhaps chiefly a tribute to the worth of the man, testifies impressively to the growth of his cause in the German capital.

THE INDEPENDENT VOTER.

Those citizens who do not care to "belong" to either the Republican or the Democratic party are the recipients of much attention from the party press. This attention generally takes the form of abuse. The late Mr. Ingalls of Kansas discharged his vitriolic wit at the Mugwumps, and the Independent voter is often compared to the man without a country. He is berated for his presumption in having opinions of his own, for contumacy in proclaiming them, and for his obstinacy in demanding a chance to vote for candidates that represent them. The craftier politicians, who do not believe in "going duck-shooting with a brass band," have great bouts in ratiocination with imaginary Independents. They prove to them that their objects are hopelessly unattainable, and that they will be most effectively attained by the success of this party or of that. They commend their sincere patriotism, and demonstrate that patriotism consists in giving the offices to one gang of politicians rather than the other. These logical exercises may not be convincing, but they are instructive. They prove at least that there is a class of voters who are supposed to be reasoning beings.

Those who maintain that habitual independence in voting is not only politically wise, but also morally right, are not greatly affected by the appeals of politicians and their organs. But they are not insensible to the criticism of men of decent character and respectable intellect, who ridicule them as "unpractical." These hard-headed men of the world are quite willing to concede the virtue of their visionary friends; but they reason, to put the matter in a concrete form, that either McKinley or Bryan will be elected, and that it is, therefore, foolish to vote for any one else. This reasoning is based on a misconception of the position of the Independent that is inveterate. The "practical" men are so sure that they are right as to make it rather hopeless to explain to them that they are humiliatingly wrong; but there are many people whose minds are open to evidence, and who may be interested in having the somewhat mysterious attitude of the Independent voter made clear. It is true that he does not stand in need of sympathy. He is supposed to suffer from lonesomeness; but while it is a pity that any one should be lonesome because of his virtues, those who are distinguished for the independence of their convictions and their action are in no more need of sympathy because they are few in numbers, than those who are distinguished for the polish of their manners or the thoroughness of their culture. The Independents do not feel in need of pity; they even have it to spare for those whose conception of patriotism leads them to follow where newspapers debarred from our clubs and libraries lead, and whose idea of good citizenship consists in voting for the nominees of their bosses.

There may be times when the Independent voter will think that the party in power is likely to endanger the permanent welfare of the country, and when he gladly supports the other party because he believes that it is a genuine opposition. A number of Independent voters seem to have made up their minds that the present is such a juncture. They think that the Democratic politicians are sincerely opposed to the Imperial policy of the Administration, and that they will reverse it if they come into power. In view of the fact that no influential and responsible Democrats except Mr. Bryan have manifested any such opposition, and the fact that Mr. Bryan defends both the war and the peace with Spain, and of some other facts, the evidence appears to us insufficient to support the conclusion. It is very clear that a great many Anti-Imperialists will vote for McKinley, and their votes will offset those cast for Bryan by men of similar convictions. Those who vote for Bryan by way of protest may thus accomplish nothing. If he is elected, they will find it very difficult to make the Democrats believe that it was because of their aid, and they can hardly expect that Senator Morgan, and Senator Tillman, and ex-Gov. Altgeld, and Mr. Croker, and Mr. Hearst will admit them into the party councils. It seems to be the common expectation that Bryan will be badly beaten. The unexpected sometimes happens, and we venture no prophecies. But if he is badly beaten, it will be very difficult to make out that the Anti-Imperialist vote is large, and it will be inferred that the Anti-Imperialist sentiment is weak. Had all those who entertain this sentiment united in demanding the nomination of candidates who really represented it, the result might have been sufficiently impressive to settle the question permanently. It might have revealed the existence of so large a body of voters determined to maintain the principles of free government as would have taught conservatism to the leaders of both parties. It is not yet too late to take such a stand.

The aim of the Independent voter is to secure such a government as will make every one feel that legislation is not bought, that the taxes are just, and that no more revenue is exacted than is necessary for a simple and economical administration. The aims of the politicians are altogether different, and they can be restrained from carrying them out only by constant vigilance. By means of our party system they have got control of the Government, and it is necessary to our salvation that their power should be broken. The functions and the revenue of the Government must be sharply limited, because these functions are administered and these revenues spent by the politicians. If there is any way of breaking their power and diminishing the influence of party except by means of Independent voting, it has not yet been pointed out. Most people concede this, but they always think that the present moment is unfavorable for action. It may cause financial disturbance, or create social discontent, or injure our chances of subduing the Filipinos, or of securing the trade of China. The politicians in power heartily applaud these views, and are ready to promise all sorts of reforms whenever the Greek Kalends arrive. The Independent voters say, Reform your ways now, or take the consequences. If the country suffers it will be your fault, not ours; and if it chooses to tolerate your misconduct, it deserves to suffer. When any considerable number of citizens take this position, it will be the dawn of better days for the Republic.

SHIP SUBSIDIES.

The Republican Campaign Text-Book for 1900 contains six pages in favor of the Ship Subsidy Bill which failed of consideration at the last session of Congress. This was the so-called Grosvenor bill, which was a modification of the Hanna-Payne bill. It should be observed that the Republican national platform did not endorse any particular bill for ship subsidies, and had only a general resolution for "legislation which will enable us to recover our former place among the trade-carrying fleets of the world." It will be remembered that Gen. Grosvenor was very angry when he discovered that a "ringing resolution" in favor of ship subsidies, which, he said, had been agreed upon beforehand, had been omitted from the platform,and that the other wishy-washy thing had been put in its place. An attempt made by Gen. Grosvenor himself to smoke out the guilty members of the Platform Committee failed.

It appears, therefore, that in so far as the Republican Campaign Text-Book advocates a particular subsidy bill it exceeds the party platform. The platform, for example, speaks of recovering our former place "in the trade-carrying fleets of the world." The Grosvenor bill, like the Hanna-Payne bill, which preceded it, was a measure to assist passenger-carrying lines, and especially one line which was already old and prosperous, and was receiving mail pay equal to nearly 5 per cent. per annum on a capital of $10,000,000, without counting its earnings from other sources. Therefore the six pages of the Campaign Text-Book in favor of this particular bill are largely gratuitous. The action, or rather the non-action, of Congress and the carefulness of the platform-makers have left all Republicans free to hold and express such opinions as they please respecting the means to be employed in "restoring our merchant marine." If any member of the party thinks that the merchant marine is restoring itself without the subsidies provided in the Grosvenor bill, and that its restoration will be more permanent if accomplished in the natural way than by artificial means, he can say so without forfeiting his party standing or consideration. It is still an open question in Republican councils.

The Campaign Text-Book says "there are several reasons why we do not own and operate ships in our foreign trade," and then it proceeds to enumerate them. One of these is that "it costs 25 per cent. more to build and operate ships in the United States than it does abroad." The assumption that we do not own and operate ships in our foreign trade is proved to be false by the fact that every shipyard in the country is crowded with orders, that no intending ship-owner can get one built under two years' time, that new plants for ship-building are now in course of erection, larger than any existing ones—in short, that the iron-ship building trade is the most prosperous branch of the iron industry in the United States to-day.

The assumption is refuted further by the fact that the International Company, the Atlantic Transport Company, the Pacific Mail Company, the Ward Line, and others are actually doing from day to day, and from week to week, the very thing that the Book says they cannot do, or cannot do with a profit. The Atlantic Transport Company, it is true, had its steamships built abroad; but as the subsidy bill has been framed to grant American registry to all ships in established lines either contracted for on January 1, 1899, or actually engaged in running from our ports to foreign ports (if a majority of their stock is owned by American citizens), the place of construction is not very important. The subsidy for such ships is only one-half as great as for those built in the United States, but the principle is the same. The Atlantic Transport Company, we may remark, has not been much in evidence as a seeker after subsidies. It is bringing out new ships all the time, and has loaned one, the best of its line, without charge, to do an errand of mercy to sick and wounded soldiers in South Africa and China. Presumably it is quite able to take care of itself without a subvention from the public taxes, but perhaps it would not refuse any dollars that might be flung around by Uncle Sam in a moment of maudlin prodigality.

It is not true that "it costs 25 per cent. more to build ships in the United States than it does abroad." The late Mr. John Roach said to a committee of Congress which was investigating the cost of ship-building materials:

> "If Congress will take off all duties from American iron, reducing it to the price of foreign iron, then we are prepared to compete with foreign ship-builders. The labor question is misstated. We are prepared to meet that claim and to ask no further legislation on the subject."

Before the same committee, Mr. Cramp, the great shipbuilder of Philadelphia, and the greatest in America, when questioned as to the rate of duty on imported materials for shipbuilding, said:

> "About 40 per cent., and, if our shipbuilders could be relieved from that, they could compete successfully with foreign builders. The difference in the cost of labor would be overcome by the superiority of American mechanics."

The duties were repealed, and rightly so, but the duties are no longer a question of importance, since the price of iron has fallen so low in this country that we sell it abroad in competition with the best English and German makes. The comparative cost of shipbuilding here and abroad, therefore, is no longer an element to our disadvantage. It is introduced in the Campaign Text-Book for purposes of deception. The entire article is made up of deceptions, all of which had been answered, before the Book itself was published, by Congressman Fitzgerald in his minority report from the Committee on Merchant Marine and Fisheries. Nobody can read that report without reaching his conclusion that "the real effect of this bill will not be to encourage the building of ships which would not otherwise be built, or to increase the trade, but to increase the profits of the already prosperous lines, which, *without subsidy*, have built, or contracted for, the very ships to subsidize which this bill is framed."

THE GROWTH OF MACHINE POWER.

The primaries of both the Republican and the Democratic parties in the boroughs of Manhattan and Brooklyn were held on August 28. The results clearly illustrate that steady growth of machine power which is the most striking feature of our political development, and they merit attention in this light quite as much as for their bearing on persons and policies.

Primaries in this State are now held under a law which is designed to give every member of a party a "fair show" in the choice of candidates. Any voter who indicated his party affiliations when he registered for the election of last November, or who has become of age since then and has filed with the proper authority a certificate of that fact and a declaration of his party preferences, can go to the primaries of that party on the appointed day and cast his vote. The regular inspectors of election supervise the process, and frauds at primaries are punishable in the same way as at elections.

There is, of course, a considerable element of voters who are so independent that they do not feel as though they had any right to participate in the primaries of either party. But making a liberal allowance for this class, there is no reason why 90 per cent. of those who ordinarily support either the Republican or the Democratic ticket at elections should not take part in the naming of that ticket. Theoretically, the present system secures all that could be asked. When it was adopted, many people were hopeful that it would greatly diminish the power of "the organization" in each party. Practically, however, the machines find it little harder to have their way now than under the old régime. There are various reasons for this. In the first place, a large proportion of both Republicans and Democrats who are sufficiently partisan to warrant their enrolment will not qualify by indicating their party affiliations when they register for an election. It is the duty of the registrars to ask every intending voter whether he does not wish to make such indication of his party choice, but a surprisingly large number of regular Republicans and regular Democrats will not avail themselves of the privilege. Of those who qualify themselves in the fall to participate in the primaries to be held at the end of the next summer, a large proportion forget all about the matter before the time comes, or, if they remember, will not take the trouble, on a hot afternoon or evening, to go a dozen steps out of their way to reach the voting place. Another percentage, which grows larger every year under the modern conditions of city life in hot weather, cannot attend a primary because during the dog-days they are away from home—in the mountains, on the seashore, in Europe, everywhere except within a short walk of the place where the primary is held. This is particularly true of the so-called "better element"—the men of education, means, and ideals as to public life. On the other hand, the machine men are always on hand. The voters upon whom the organization of either party depends are not men who take long vacations, or short vacations either, at times that will interfere with their work for the organization. This is as true of the generals and colonels and lieutenants as of the rank and file. Croker and Platt never forget the date of the primaries, and if they are not in personal control of the machinery, they intrust its running to men who will not neglect anything. The machine always "attends strictly to business," and in politics, as in every other relation of life, the professional beats the amateur, nine times out of ten.

A popular uprising can still bring the machine to terms, but it seems harder to accomplish this every year. The organization grows steadily more powerful, and the difficulties of building up an effective opposition constantly increase. Power more and more concentrates in the hands of the boss. He dispenses not only patronage, but money, through his relations with the great corporations, his control of contracts, and his influence over business of various sorts. The man who opposes the organization runs the risk of losing his office if he holds any, will find his name put on the black list for the future, may suffer in his business. Revolts are yet attempted, and once in a while they succeed, like that of "Abe" Gruber against Platt in the Twenty-first Assembly District of New York County. But such revolts become increasingly difficult, as has proved the case with the rebels against Tammany Hall under the lead of John C. Sheehan in the Ninth Assembly District of New York, and with the opponents of the McLaughlin ring in more than one Brooklyn district.

Summed up in a sentence, last week's primaries show that Platt controls almost all the delegates to the Republican State Convention from Manhattan, as he does from the rest of the State, and Croker all those to the Democratic Convention from this borough; that the supporters of Coler's nomination were beaten by representatives of the McLaughlin ring in Brooklyn, and that while the delegates elected in that borough will vote for Coler at Saratoga if they "get orders," the indications are that McLaughlin's lieutenants who now run the Brooklyn machine are in alliance with Croker; in short, that the organization in the Republican party can nominate Odell without any opposition, and that the other organization can put up anybody whom it chooses against him. Such is popular government in the Empire State of the Union at the end of the nineteenth century.

THE COAL FAMINE.

In popular discussion, the excessive rise in the price of English coal has been chiefly associated with the rather startling possibility that the soft-coal producers of the United States may enter on an extensive scale the rich consuming markets of Great Britain. This dream, however, is not likely to be realized in the near future. It is possible, of course, that the price of English coal might go so high as to admit of a profit on shipments from Ohio and Pennsylvania, after paying railway and ocean freights. But any extensive movement of the kind would regulate itself. Large new supplies in England would check the rise in English prices. Simultaneously, a really large export demand would raise the American price. Even if a margin of profit on the operation exists to-day—which is doubtful—it could not be sustained in the face of a heavy movement.

To England itself, a very different problem is presented by the rise in coal. Estimates lately published in London reckoned the average export price of English coal at 8.98 shillings per ton in 1897, at 9.92 shillings in 1898, at 10.72 in 1899, and at 15½ shillings for the first half of 1900. Recent export quotations at Newcastle have ranged from 16½ shillings for the second grade to 19½ for the best steam grades. What this enormous rise in cost of fuel means to English industries may be judged from the recent half-yearly reports of the railways of that country, the summary of which shows an increase of 30 per cent. in the cost of coal. On lines with an aggregate semi-annual net revenue of $73,500,000, this single item of increased fuel expenses foots up no less than $2,650,000, and turned an increase in net receipts over 1899 into a heavy decrease. Three-fourths of the companies have had to cut down dividends. What is true of the English railways must obviously be quite as true of the immense manufacturing and shipping industries of Great Britain.

Writing in 1865, Prof. W. Stanley Jevons, after examining the ratio of increase in consumption of English coal from 1781 to 1863, and assuming a similar future ratio of increase, reached the conclusion that "we [the English nation] cannot long maintain our present rate of increase of consumption; that we can never advance to the higher amounts of consumption supposed." "This," Professor Jevons inferred, "only means that the check to our progress must become perceptible within a century from the present time; that the cost of fuel must rise, perhaps within a lifetime, to a rate injurious to our commercial and manufacturing supremacy; and the conclusion is inevitable, that our present happy progressive condition is a thing of limited duration."

We have not space to go over the various arguments by which Professor Jevons reached this gloomy conclusion. In substance, his inferences were based on the assumption that a century of English coal-mining at the estimated ratio of increase in the output would exhaust the mines to the depth of 4,000 feet. But an average depth of 2,000 feet, he reasoned, would result in the doubling of the cost of the product. Hence, it was inferred, the check to English prosperity, based as it largely is upon its cheap and abundant coal, was an early possibility.

It is a rather curious fact that the present price of English coal nearly fulfils Professor Jevons's prediction; the current quotations of sixteen shillings per ton, or thereabouts, comparing with nine shillings for the same grade in 1860. But it should also be observed that this entire rise has been compassed within three years; the average price of 1897, already cited, falling below nine shillings. Such a movement arouses the same suspicion, the same reluctance to rush to conclusions for the longer future, as were excited, for instance, by the rise in iron from $11.25 per ton in August, 1898, to $25 in November, 1899. Few observers of the market looked on the movement as meaning anything more than an excessive upward swing of the pendulum of trade prosperity, and, in fact, to-day the price is down again to $16.50. Sir William Crookes was led by the rise of wheat in May, 1898, to $1.93 per bushel, into some wholesale conclusions of impending famine. Yet wheat sold freely about seventy-five cents per bushel in the autumn of 1899, and is not very much higher now. The market for coal has not been free from similar fluctuations. Mr. Sauerbeck's tables show that the price of English export coal advanced from an average of 9.8 shillings per ton in 1872 to 20.9 shillings in the "boom year," 1873, and by 1879 was back again to 8¾ shillings. Similarly, from 8.41 shillings in 1888, the average mounted to 12.31 in 1892; yet in 1897, as we have seen, it was again selling below nine shillings per ton. Manifestly, some other influence than exhaustion of the mines has been at work on these occasions.

Professor Jevons's estimates, based on an arbitrary increase in ratio of consumption, assumed an English output of 234,700,000 tons in 1891, and of 331,000,000 tons in 1901. As a matter of fact, the actual production of 1891 was forty-five million tons below his estimate, and the recent returns of the British Government's statistical bureau show that Great Britain's mines produced in 1899 less coal by 111,000,000 tons than were fixed for the end of the present decade by Professor Jevons. There have been periods (such as 1884-1887, and 1892-1893 inclusive) when Great Britain's coal consumption slackened materially. In 1893 the output barely exceeded that of 1883, and was less than in 1881—upsetting, at least for that period, the estimates of decennial progression.

Furthermore, current statistics prove unmistakably that it is not excessive English home consumption, nor yet a sudden rise in cost of production, which has forced up so strikingly the cost of coal. The British Board of Trade reports show that export of coal from England, during the calendar year 1899, rose 6,500,000 tons over 1898, the increase being common to a dozen foreign countries. The increase thus far in 1900 has been continuous, though less rapid. As compared with 1890—another year of trade activity in Europe—the increase in last year's coal exports was thirteen million tons. This is a highly interesting factor in the problem, and one with which, in its broader economic bearing, Professor Jevons was as perplexed to deal as a present-day economist could be. It is perfectly obvious, however, that a real excess in this direction will correct itself; for a rise in prices such as has lately occurred must, in the end, be as prohibitory on export trade as the export duty on coal once discussed by English economists. It is in these competitive foreign markets that American export coal will eventually find its largest opportunities—always subject, however, it must be recalled, to continuance of active European demand and relatively high prices for coal.

ON TRANSLATING THE 'ARABIAN NIGHTS.'—II.

So end the attempts in English. The classic rendering of 'The Nights' is still to come. Meanwhile, two translations are appearing in Germany and in France. The one, by a certain Max Henning, otherwise unknown as an Arabist, is in Reclam's excellent "Universal-Bibliothek," and is a conscientious and laborious piece of work. It is as nearly complete as may be, and about half of the verses are rendered after Lane's fashion. The prose is of a happy simplicity, with a sub-flavor of the *Märchen* style; but the version generally cannot lay claim to literary merit. Very different is the French translation. It is by "le Dr. J. C. Mardrus" (also unknown as an Arabist), calls itself "traduction littérale et complète," and is written frankly from a literary standpoint. The Arabic scholarship of Dr. Mardrus is beneath criticism; his version absolutely swarms with the most naive blunders, some of which have descended from Galland, while others appear to be due to a Parisian consciousness guessing text from context. But such evident blunders go only a little way towards exhausting the differences between this *traduction littérale* and its original. On almost every page there are expansions and "improvements." The erotic passages have especially excited the genius of Dr. Mardrus. While other translators make apology, more or less dexterous, for such elements in their work, he indefatigably gilds the gold and paints the lily till the poor 'Nights' themselves grow pallid and dull beside this distant descendant. Yet, undoubtedly, there is much to praise in his recension—such is, perhaps, the politest word which truth will permit. Except where misled by ignorance of Arabic (and Dr. Mardrus seems to have strangely combined much knowledge of the life of the East with little of its language), he has caught and expressed the true Oriental flavor. When he is literal, there is an absoluteness in his literality, a childlike plainness of rendering, which touches genius. He has evidently had delight in his undertaking; and if we could away with his extensions, we might take delight in it too.

In face of this tangled skein of success and failure, how stands the case for the future English translator? What is essentially his problem? What should be his aim? What his canon and test? His is no ordinary task of translation. He must recreate as well as render; 'The Nights' in English are and must be essentially different in spirit and effect from 'The Nights' in Arabic. The lack of a frank recognition of this is the rock on which so many translators have split. They have failed to see that there are three separate 'Nights' as 'The Nights' have three separate audiences. Matthew Arnold pointed out, in his lectures on translating Homer, that our test of a translation of Homer must be the effect which it produces on a modern Grecian—does it work upon him in the same way as the original?—that our test cannot be the emotions produced in Sophocles, say, when he read Homer, for we cannot have any idea what those emotions were. Only thus and so far can there be validity in the canon that a translation must produce on the minds of its readers the same effect that the original does on its readers. So for Homer there are two audiences, one of the ancient Greeks, now passed away and out of our reach, and the other of modern Grecians. But in the case of 'The Nights' the complication is still greater. The mediæval Arab read them or heard them read, and had certain emotions; they are read at the present day throughout the Arabic-speaking world, and produce practically the same emotions. That is one audience and one set of emotions. Next, they are read by Arabists with certain emotions, mostly ethnological, sociological, anthropological, but also, in part, æsthetic. That is another audience and another set of emotions. The third audience consists of all those who read in Western languages and in ignorance of the East. They have their emotions, which are, again, quite different. For each of these audiences 'The Nights' is an essentially different thing, and produces an essentially different effect.

Take as an illustration one phase only, the supernatural element. To the native reader the whole supernatural apparatus, the conception of a second world of Jinn, lying parallel to our world and from time to time mixing in our life, is real and existent. It is a possibility for him at any time that a Jinn might rise from his well or melt through the wall of his room; that in ploughing he might strike an enchanted hoard, with all equipment of magic lamps and rings and gardens of jewels; that his horse might prove an ensorcelled prince, or his wife a ghoul or enchantress. Allah is great, and the marvels of his creation who can fathom! Thus it comes that the effect upon Oriental and Occidental must be different. The true parallel, *qua* effect, to these tales for us is to be found in the modern stories of the wonders of science and pseudo-science which we owe to the ingenuity of M. Jules Verne and his array of followers. Further, what is the attitude of the Arabist and the effect on him? Again the parallel with Homer breaks. The Grecian who reads Homer is separated from the non-Grecian practically by his knowledge of Greek. Every educated man has more or less knowledge of the civilization, the spirit, the religion, the manners of the Homeric age. We are its heirs, and the line of descent is direct. But with things Arabic it is different. The worlds are too far apart. The linguistic studies of the Arabist which enable him to read 'The Nights' teach him also, or should teach him, to know the world of 'The Nights,' a world of which the non-Arabist knows simply nothing. Thus the Arabist stands apart not only by his knowledge of the language, but by his acquaintance with a separate and utterly different civilization. The tendency, then, is for 'The Nights' to become for him, what they became for Lane, a vast storehouse of information on the manners and customs, the spirit and the life, of the Muslim East. He cannot help himself; he cannot read them as the Arab does; he cannot read them as the non-Arabist does. To the non-Arabist their world is out of space, out of time; a land of enchantment whose like has never existed, never can exist. Bagdad is on no map; Grand Cairo is a dream. As the magnificent visions of opium rose to De Quincy at the roll of the words, "Consul Romanus," so to "Commander of the Faithful" the gates of mighty cities unbar, of Balsora and Bagdad. In that fine air their towers are as real, their bowers are as green and fresh, as any that ever gleamed in the Tigris stream or bloomed in the gardens of Damascus. These glorious visions are the most real impossibilities that have ever been.

If, then, 'The Nights' of an English reader can never be 'The Nights' of an Arab, and can be 'The Nights' of an Arabist only in so far as he holds fast by the memories of childhood, any theory of "the same effect" must fall to the ground. The effect cannot be other than different, and what we have seen of the fates of translators proves the difference. The work of three only can stand as literature, Galland, Torrens, and Payne. Mr. Payne's success has been achieved by making 'The Nights' over into a European fairy-book. The peculiar *cachet* of the East has vanished, and that we cannot spare. The secret of Galland and Torrens, far enough apart as they stand in other respects, is illusion; Burton, in the quotation given above, has expressed Galland's value with admirable precision. Illusion must be the whole aim of the translator; his governing conception must be that he is rewriting a book of fairy-tales—fairy in the widest sense. And his atmosphere must be Oriental, effective Oriental, with broad sweeps and bright colors. No word or hint of phrase or idea may come in that suggests the West. Here Burton, in a rough-and-ready way, and Mr. Payne, in a subtle, have made their worst mistakes. Further, there may not be any notes, or, at most, such few and short as those by which Galland showed his infallible judgment. The translation must justify itself by standing in no need of such apparatus of commentary. And if, by chance, anything be left dim or obscure, it will but go to heighten the imaginative effect and give the stuff that dreams are made of. The reading child that reads, and dreams, and wanders in lands of mystery beyond the mountain Kaf, has no need of learned crutches. And, simply for this, the rendering of the prose cannot be too literal. Here Galland and Torrens part company, and we must follow Torrens. As the unidiomatic English renderings of Galland's French—absurdities and all—had their charm of novelty and quaintness, so Torrens rightly felt the character and glamour that lay in his word-for-word experiment. And his lead, too, we must follow in the lyric freedom of his renderings of the verses. That they must sing themselves, and that they must have the plain stamp of easy quotations or light improvisations, is more than all the leather and prunella of exact form and scholarship. And in both prose and verse, how much can be given and how much must be changed or omitted will be the test of the translator's judgment. But, above all, there may be no word from beginning to end that tells of either transformation or suppression. Few things in the often absurd annals of expurgation have been more absurd than the scholarly care with which the decent Lane has told in his notes what he has done in his text. For the child, the book is ruined, and for the rest of us, when we read a draped text, we do not care to be forced to notice it. Illusion, in this and in everything, is the supreme duty of the renderer.

These qualities, then, he must have—the unknown who is yet to come: imagination and the power of stirring it, the lyric faculty, and a judgment to be shown in prudent veilings without hints "we might an we would." He need have little Arabic, but he must know the East; the world of letters can ill afford another such mistake as that of Mr. Payne. He must be an artist in literature, and not a student in language; there has been enough of that. He must be ready to give himself, and yet remain in the background; to be a re-creator, and be reckoned a mechanical. If Mr. Kipling could meet this last condition, he could meet the others. There seems better hope with him than with any one else.

THE INTERNATIONAL CONGRESS OF MATHEMATICIANS.

PARIS, August, 1900.

This year, if ever, we have a chance of realizing the great number of international congresses that are held; for it is said that several hundreds are meeting in Paris under the auspices of the Exhibition. Some of these are simply isolated congresses, others are members in a series meeting annually or at longer intervals, purposely timed so as to bring the congress to Paris in the year of the Exhibition. From some points of view this may have been sound policy, but it is obvious that a good deal can be said against it. So far as the Mathematical Congress, held August 6 to 11, is concerned, it certainly tended to diminish the numbers of those present, though the extreme heat of the preceding three weeks probably had much to answer for.

The exact number cannot be given, as the first list of members—the only one obtainable during the week of the Congress—contains the names of several who had intended to be present, but for various reasons had not carried out this intention, and omits the names of a few who arrived during the proceedings. Approximately, there were 225 full members, accompanied by about 25 members of their families; but, to my own knowledge, some of the meetings were attended by non-members. Naturally France provided the largest contingent, which numbered 90; then came Germany with 25; 45 were evenly distributed among the United States, Italy, and Belgium, and 40 among Austria, Great Britain, Russia, Sweden, and Switzerland, the remainder containing two or three representatives from Denmark, Holland, Portugal, Rumania, Servia, Spain, and South America, and single representatives from Canada, Greece, Japan, Mexico, Norway, and Turkey. The United States representatives came from Austin (Texas), Berkeley, Bryn Mawr, Cincinnati, South Dakota, Evanston, Haverford, Lehigh, New York, Princeton, San Francisco, Vassar, and Washington.

The opening general meeting, held August 6 in the Palais des Congrès, in the Exhibition grounds, was called to order by M. J. Tannery at 9:30 A. M. The veteran M. Hermite, unable to be present, was named Président d'honneur, M. Poincaré being the actual President. The different countries represented were recognized, as far as possible, *by the appointment of their* best-known *members as Vice-Presidents* (Czuber, Austria; Geiser, Switzerland; Gordan, Germany; Greenhill, England; Lindelöf, Finland; Lindemann, Germany; Mittag-Leffler, Sweden; Moore, United States of America; Tikhomandritzky, Russia; Volterra, Italy; Zeuthen, Denmark), and Secretaries (Bendixon, Sweden; Capelli, Italy; Minkowski, Switzerland; Ptaszycki, Russia; Whitehead, England). Two or three of these were, however, not present, but the others took their seats on the platform. After a few words of welcome from M. Poincaré the two addresses of the day, both in French, were delivered by M. Cantor (Heidelberg), "Sur l'historiographie des mathématiques," and M. Volterra (Turin), "Trois Analystes italiens: Betti, Brioschi, Casorati, et trois manières d'envisager les questions d'analyse. Leur influence." The scope of M. Volterra's address is sufficiently shown by the title; it was an interesting comparison of the lines of thought of these three Italian analysts, very clearly delivered. The Italian mathematics of this century has to be taken seriously into account as a very important component in the development of mathematical thought along its present lines; and its influence, not only in matters of pure analysis, but still more in certain regions of geometry, will probably be felt to an even greater extent in the coming century. "Every man has two countries—the one in which he was born, the other Italy," said Henryk Sienkiewicz; and it may be that shortly every mathematician will find that, whatever his attitude towards other foreign countries, he has intellectual affinities with his Italian *confrères*. M. Cantor outlined the development of historiography during the last century and a half. It existed, it is true, some two thousand years before this, as is proved by a fragment that has survived from the history of Eudemus of Rhodes; but as an ordered science, this period, beginning with Montucla, practically covers the whole. Naturally, M. Cantor dealt only with authors no longer living; any attempt to go further would have been obviously inappropriate. His view is that, as regards the development of mathematics in general, there is still something for the historiographer to do on lines already laid down; there is room for discussion and argument. The history of modern mathematics, however, beginning with Lagrange, has yet to be written; and this cannot be treated in the same broad manner. The history of the different branches must be written separately, but then the development of the ideas that they have in common must be traced through these separate histories, and presented in a final volume, the 'Histoire des Idées,' as M. Cantor called it. This is the task for the historiographers of the future.

The papers of less general scope prepared for the Congress were read in the sectional meetings, which were held in the Sorbonne. At Zürich, where only one day was appropriated to this part of the proceedings, the various sections sat at the same hours, with the result that there was a continual passing backward and forward of members anxious to hear papers in different sections. The longer time available in Paris, four mornings and three afternoons, made it easy to avoid this difficulty, as there were never more than two sections sitting at any given hour, and often only one. In Section I., Arithmetic and Algebra (President, M. Hilbert, Secretary, M. Cartan), a noticeable paper was that of M. Padé, "Aperçu sur les développements récents de la théorie des fractions continues"; papers were read also by MM. Hancock, Dickson, Stephanos, and others. In Section II., Analysis (MM. Painlevé, Hadamard), the most interesting communication was M. Mittag-Leffler's "Sur fonction analytique et expression analytique," which called forth an animated discussion between MM. Borel, Hadamard, Painlevé, and the author. In Section III., Geometry (MM. Darboux, Niewenglowski), MM. Lovett, Macfarlane, Stringham, Amodeo, and others read papers of a more or less geometrical bearing. The most important papers belonging to Section IV., Mechanics (MM. Larmor, Levi-Civita), namely, those of MM. Hadamard and Volterra, were read, by permission, at a joint sitting of Sections V. and VI., as through some misunderstanding Section IV. had closed its sittings. Section V., Bibliography and History (Prince Roland Bonaparte, M. d'Ocagne), on account of the unavoidable absence on some days of its President, was united with Section VI., Instruction and Methods (MM. Cantor, Laisant), to the satisfaction of both sections, as their subjects were so closely allied.

The meetings of this division were possibly the most interesting of all. They were opened by a general paper from M. Hilbert on the future problems of mathematics, indicating the lines along which he considers that progress may with most certainty be assured. While problems are primarily suggested to us by experience, as in the case of the duplication of the cube, etc., yet, as the science progresses, it is the logical faculty of the intellect that imposes them upon us, as we see in problems relating to prime numbers, etc. A problem is truly *solved* only when the solution can be obtained by a finite number of logical processes from a finite number of hypotheses furnished by the problem itself. It may happen that such a solution is impossible; the problem then is to demonstrate rigorously this impossibility. In many cases the problem reduces to that of formulating an adequate system of independent and compatible axioms, on which the whole subject shall be founded; this is notably the case in Arithmetic and Physics. M. Fujisawa then gave in English an account of the older Japanese mathematics. The elucidation of this is specially difficult, as so much reliance was placed on oral transmission, with very limited publication. There are about two thousand volumes to be transcribed; in these, valuable work is mixed up with that which is trivial and elementary. One part of the Japanese teaching was derived from the Chinese many centuries ago; this part is unimportant in itself, and lacking in rigor, but it is interesting historically. The other part shows plainly that a special kind of mathematics, now entirely obsolete, had its origin in Japan, and was developed entirely free from external influences; the earliest important name is that of Seki. The value of the ratio of the circumference of a circle to the diameter was found correctly to 49 places of decimals, and a symbol for zero was in use; thus, both in content and in expression, this early Japanese mathematics had passed beyond the purely elementary stage. Other interesting papers in Sections V. and VI. were those of MM. Padoa, Capelli, and d'Ocagne.

A considerable part of the Friday morning sitting was devoted to the discussion of a resolution in favor of the adoption of a special language as the vehicle for scientific publications and communications. The experience of these international mathematical congresses, however, where the four languages—English, French, German, and Italian—are admissible in any communications and discussions, has not predisposed the members to desire the substitution of any one artificial language for the happily limited diversity now allowed; and notwithstanding the energetic support the resolution received from its advocates, these were easily outvoted. By a certain subtle irony, the most forcible arguments against the resolution were made by a Russian and an Italian, both speaking in French.

The second of the two general gatherings, the formal closing of the Congress, was held in the Sorbonne on Saturday morning. It was unanimously resolved that the Congress should accept the invitation it had received to assemble for the next time in Germany, most probably at Baden-Baden; 1904 was chosen as the year, the time to be either the beginning or the end of the summer vacation, as found most convenient by those in whose hands the detailed arrangements will rest.

The remaining two general addresses of the Congress were then delivered. M. Mittag-Leffler, in his narration, "Une page de la vie de Weierstrass," dwelt on the relations of Weierstrass with some of his contemporaries, those who were concerned in the development of the mathematical conceptions that appealed most strongly to him. Extensive extracts from correspondence were adduced in illustration. The address, being rather lengthy, was of necessity somewhat curtailed in the reading, and suffered thereby in the proportion of its parts; hence it did not make so vivid an impression on the whole as its intrinsic interest would have warranted. M. Poincaré read a brief disquisition, "Du rôle de l'intuition et de la logique en mathématiques." His rapid and not very energetic enunciation made him difficult to follow, and consequently but few of the audience were able fully to appreciate his address. This was disappointing, for the opportunity of hearing one of M. Poincaré's broad and stimulating philosophical essays had been looked forward to with eagerness. He took no other active part in the week's proceedings, confining his Presidential utterances to the narrowest possible limits. Some amusement was caused by his curt dismissal of the Congress; he barely gave himself time to gather up the manuscript of his address before remarking, "The session is ended and the Congress is over."

The arrangements were unfortunately very imperfect in many respects. There was no reception committee charged with attention to minute details, such as did so much to insure the success of the Zürich Congress of 1897, and no central meeting-place for members. It was most difficult to obtain the necessary information, for the responsibility was divided between the general secretary of the Congress and the firm of Carré & Naud; the secrétariat appeared at first to have no settled habitation, and in fact to exist only intermittently. Thus, when the hour announced by the management for the first general meeting, namely, 2:30 P. M., was changed by the Exhibition authorities to nine A. M., no notification was sent even to members who had already paid the membership fee of thirty francs, although in some cases a special request had been made for a telegram to be sent in the event of any change; and in consequence of this remissness many, both native and foreign, who were actually in Paris at the time, were debarred from being present. The informal reunion at the Café Voltaire, on the evening before the opening of the Congress, was not known to all members, or the change would have been more widely known. The committee of management, not unnaturally in the circumstances, did not feel able to exercise any control over the living arrangements offered to members; but they made an unfortunate choice of the agency they recommended for this service. Just before the Congress, when exact information was certainly easy to obtain, this agency informed inquirers that it would be impossible to get a room at any decent hotel for less than 15 francs per night; whereas it was easy enough to secure a room at 6 francs, and perfectly possible to obtain satisfactory *pension* arrangements at from 7 to 10 francs per day, room included. There is no doubt that a congress is more difficult to organize successfully in a large city that offers its own distractions than in a comparatively small town; but there is all the more need to guard against the overlooking of any of the important details. It is but fair to add that these deficiencies were felt most in the opening days, and in the secretarial department; they did not affect the arrangements for social intercourse on definite occasions, which were carried out very successfully. The distractions of this kind offered to the members were a reception at the École Normale Supérieure, held on Tuesday afternoon at the close of the sectional meetings for the day, and a soirée given by Prince Roland Bonaparte on Saturday evening. The members of the scientific congresses then meeting in Paris received invitations to this; and, as many well-known scientists had consented to exhibit their own special apparatus, it was an unusually interesting gathering. In addition to these, a certain number of tickets to President Loubet's fête on Friday afternoon, in honor of the Shah of Persia, were distributed among members, as the special fête that had been arranged by the President for Thursday evening was given up on account of the funeral of King Humbert of Italy.

The final act in the proceedings was a very enjoyable banquet at the Salle de l'Athénée-Saint-Germain, at noon on the day following the formal closing of the Congress, when M. Darboux presided; the toasts were proposed by MM. Darboux, Geiser, J. Tannery, Stephanos, and Vassilief. The Congress was most fortunate as regards the weather, which was very pleasant throughout the week. The oppressive heat of July had subsided, and though there were occasional heavy showers, yet they were neither continuous enough nor frequent enough to interfere seriously with any plans.

Correspondence.

A LEADER OF THE UNWILLING.

TO THE EDITOR OF THE NATION:

SIR: I have been a regular reader of the *Nation* almost since 1865, when it started, and not many weeks in all that time have I missed its welcome coming, and so have steadily kept myself under the pleasant and wholesome discipline of its good and worthy teaching. Indeed, in matters political, I have known in the *Nation* a guide, philosopher, and friend that never lowers its ideals and standards, that makes no bargains with the common and ignoble, and is ever strenuous for the things that are truly excellent. With such a political bringing up, it is not strange that I don't find it easy to march to any other than the *Nation's* political music, and that its candidates for the Presidency should also (with one exception) always have been mine. We were on opposite sides in 1896, as in that campaign I stood by Bryan. But even in that lurid contest I did not stop reading the *Nation*, hot and heavy as were its blows against my man and his cause. It was a good experience to make the acquaintance of one's oracle in the capacity of an adversary; I got to know among other things how the "other fellow" must feel under the sting of your adverse criticism.

Bryan's speech before the Chicago Convention, and his remarkable efforts in the campaign that followed, converted me to the belief that in him there had appeared among us a born leader of men, and one whom it would be a gain to the country to place well up at the head of affairs. I am a believer in the uses of great and good men, and that they will ultimately come to their own in the minds of the people. I can't get it out of my head that the day will yet come when the further stages of Bryan's career will convince the American public, regardless of party, that he is splendid as an orator, sincere and noble in purpose, and as brave and strong as the best of our public men. To me he is a man of clear head, honest heart, and strong will, and is, besides, a politician more tactful, masterly, and triumphant than any other at present on the political stage. Men of Bryan's stamp are not given to a country every day, and when they do come I am in favor of profiting by their services to the fullest extent. Of course the *Nation* will ridicule this judgment as the foolish praise of a passing infatuation, but can we not at least say that up to this time our leader has been more of a success than a failure, and, in spite of the strongest opposition, has steadily grown in favor, as a man of ability and character?

A light such as his cannot be hid under a bushel, and when it does shine it must needs be that more and more people will be dazzled. Shall it go for nothing that he is a second time the spontaneous choice of three parties for the Presidency, that the more he says, and the better he becomes known, the less he is feared and hated, and the better he is liked and trusted by the country at large? Four years ago he was a "monster of such hideous mien" that to speak well of him in good society was dreadfully bad form, while now even such men of light and leading as Carl Schurz, Bourke Cockran, George S. Boutwell, and I know not how many more of their order, share his views on the great issue of the day, and are helping their utmost to elect him President. No, the followers of Bryan are not mad and foolish; they know as well as the people of other parties when a great presence is among them, and they cannot but choose to rally to his leadership. We think that the ability and worth he has shown as a party leader mark him out as a fit man for high and responsible position.

Again, however lightly some people may think of Bryan, there are others who know full well what they are about who do not underrate his strength and importance. In this case are the leaders of the opposite party. These know he is a force to be reckoned with. In order to secure his defeat, they have not ventured to rely on McKinley alone, but have brought to his aid that splendid organizer and director, Mark Hanna, and that brilliant man of war, and thoroughly able and admirable Hotspur of Imperialism, Col. Roosevelt.

The Bryan of 1896 is not the same man in the public mind as the Bryan of to-day, and no hue and cry of the Opposition can bring back the earlier figure. Then his name was the epitome of all that was bad and dangerous in a public character, and his cause was held to be a menace to property, and deeply tainted with the heresies of socialism; now he is recognized, to say the least, as a man of high ability, real honesty, and true courage, and the brilliant and powerful champion of a widely popular movement against a dreaded and impending change in the structure and principles of our Government.

So again for the second time the present campaign finds me to some extent out of harmony with the *Nation*. But we are far nearer together than we were in 1896. Then your opposition to Bryan and all that he stood for was radical and uncompromising; now you are in full accord with his "paramount issue," and are hostile only to the man. And I wonder if you may not be mistaken about the man. Anyhow, the man can't be got rid of. He is the chosen and only leader of the Anti-Imperialists, whether they like it or not; without him their cause would get no hearing in the land, while with him it may win, and a new and nobler gospel of "Duty and Destiny" may come to guide the minds and heads of our rulers.

In the midst of a situation so serious, it is too bad that the great Achilles of the Independent voters of the country should, by abiding in his tent, be lost to the cause, when possibly by boldly sallying forth to meet the adversary in the thickest of the battle, the day might be saved for the ancient faiths of the people and the main bulwarks of our political system.

A. R. Cooper.

Louisville, Ky., August 28, 1900.

A FARMER-PREACHER.

To the Editor of The Nation:

Sir: I have read with some interest and much surprise an article in the *Nation* of July 26, entitled "The Discontented Farmer." As I am the person whose temporal and moral status is most particularly set forth in that article, it may not be out of place for me to offer a few words regarding the same.

The contemplation of a clergyman at once a farmer so prosperous and a Populist so discontented seems to have disturbed the equilibrium of your logic, since the conclusions you arrive at seem hardly justified by the statements made by Mr. Spahr in the *Outlook*. It is true that Mr. Spahr has entitled me "The Populist Preacher," and I have been somewhat curious to know how he reached the conclusion that I am an "enthusiastic Populist," since I have ever been so little given to politics that few of my friends have ever known to what party I belong, if to any. If to preach divine compassion and brotherly love is to be a Populist preacher, then I try to be one; or if to place country and principle above changing party is to be a Populist, I can glory in the name; but the simple fact that some years ago a few of the neighbors wished me to act as President of their Alliance, I had not regarded as a call or an ordination to be a Populist preacher. However, many things that I read in the *Nation* and other journals of like repute lead me to think it may be a desirable thing to be a Populist; for I remember that one very high in authority once said, "Blessed are ye when men shall revile you and say all manner of evil against you falsely."

It is also true that I hold 640 acres of land, a part of which was purchased from the Government and the balance from other parties some twenty-one years ago. In your estimate of what you are pleased to call the "unearned increment," you take no account of interest on investment, taxes, or improvements. This 640 acres of land has now cost us for investment, interest, taxes, and improvement upwards of $24,000. You estimate its present value at $19,000. I will sell it at your valuation, and add as a present the whole herd of cows, with horses and machinery sufficient to work the whole farm.

Your reasoning on the business part of the situation is equally unsound. You figure profits from the dairy without taking any account of expenses for feed, etc. Even a Populist preacher will hardly be able to produce 350 pounds of butter per cow from his dairy without feed. The cost of feeding a dairy cow will average not less than $35 per year. Please deduct this with interest, taxes, and insurance on the cows, and see if you can figure out results that ought to make even an editor green with envy. If I am wrong, I trust you will pardon an obscure farmer for not being able to appreciate the full force of your logic, and also if it appears to him that the sarcastic insinuations in your article are hardly becoming in a journal so venerable with age and so exalted in title.

Your sympathies seem to be very strongly enlisted for the railroads, and it may be a relief to you to know that in this Northwest, at least, they have not been without their share of the "unearned increment." Every other section of land in this whole valley in Minnesota has been given to the railroad. The farmers have paid taxes on their land for twenty years, while the railroad paid none on its lands. Every dollar that the farmer spends for improvements adds to the value of the railroad lands as well as his own. Their interests are largely mutual, or ought to be. I do not know that farmers as a class are better than other classes of citizens, but if we are to judge by such articles as the one noted in the *Nation*, they are grossly misunderstood or misrepresented by those who ought to be leaders of thought and information.

Since our private family affairs have been exposed to the public gaze, and by the *Nation*, in an invidious spirit, it seems not unfair to add that we have never operated a dairy of more than two-thirds the size of the one accredited to us; and while it might easily appear that the burden of milking these cows has fallen heavily upon the wife, the truth is, she has never been known to attempt the milking of a cow but once, and that attempt was not regarded as a complete success, although she has ever been a true helpmeet in things temporal and spiritual.

It would no doubt appear to one reading the "Discontented Farmer" in the *Nation* as though this clergyman, with his "little church" and his large farm, had surely reversed the Master's order to "seek first the kingdom of God." Allow me to say that for twenty years he has never had less than from three to ten mission stations in charge, scattered over a large district, and distant from 15 to 100 miles, and at three of these there are now churches and rectories where when he began there was nothing. If he has chosen to dig rather than beg that he might preach the gospel in the waste places of the earth, it is a matter between himself and his Master. Since for twenty years he has spent long hours of labor during the day that his family might have a home, and long hours of thought and study during the night that he might preach the gospel to the poor, he cherishes the hope that as a result there has been some small increment in human hearts of faith and righteousness, whatever the personal increment may have been.

S. Currie.

Euclid, Minn., August 27, 1900.

[Mr. Currie must not blame us for exposing his private affairs to the public gaze, since we but commented on what Mr. Spahr had published in the *Outlook* and in book form, and we mentioned no names. Nor were we guilty of commenting in an invidious spirit, for we assure Mr. Currie that the prosperity of families like his affords us the most unalloyed satisfaction. Nor shall we consider the question of profit and loss with him, although we are confident that if he will offset past profits against interest and taxes, he will feel more content with his lot. We are very glad to hear that Mr. Currie is not a Populist, and that he preaches brotherly love, the lack of which is a Populist failing. But we could wish that he had displayed a little more charity in his letter to us. We fear that the old Adam got a little the better of him; and we must protest against being cudgelled for violations of privacy committed by other people.—Ed. Nation.]

NOT IN FRANCE ONLY.

To the Editor of The Nation:

Sir: The letter in your issue of August 23, on the dangers of Paris for the American student, may be usefully compared with the advice given by an eminent theologian to young theologians studying in Germany:

> "Aber ich kann nicht umhin, im Anschluss hieran, ein Gebiet zu berühren, dass allerdings nicht ganz leicht zu besprechen ist, das ich aber doch nicht mit Stillschweigen übergehen kann; ich meine die Versuchungen und Gefahren, welche gerade dem Jüngling überhaupt von der sinnlichen Seite seiner Natur kommen. Es hat jeder mehr oder minder damit zu schaffen. Ich weiss

das aus eigener Erfahrung. Und es wird auch Dir bis jetzt nicht erspart worden sein, wenn ich auch von Dir den Eindruck habe—wenigstens wünsche ich es Dir—dass Dir der Kampf dagegen bis jetzt nicht zu schwer gemacht worden sein mag. Ich habe auf der Schule die gewöhnlichen körperlichen Uebungen und Künste des Turnens, Schwimmens, Schlittschuhlaufens, Fechtens und Reitens fleissig geübt und meinen Leib tüchtig strapazirt, bin überhaupt nie gegen ihn weichlich gewesen, sondern habe ihn immer hart gehalten; aber das hat mir nicht erspart, seine Anfechtungen und Versuchungen erfahren zu müssen. Der flüchtige Blick auf ein versuchliches Bild, wie man dergleichen nur allzu oft besonders an den Schaufenstern sieht, konnte in mir einen Sturm der Sinne hervorrufen. Ich klagte einmal noch als Kandidat einem etwas älteren Freunde über diese Erregbarkeit meiner Natur—worauf mir jener Freund mit derselben Klage über sich erwiederte. Es war mir allerdings ein Trost, daraus zu sehen, 'dass dieselben Leiden über die Brüder in der Welt gehen.' Das Gebet Sirach 23, 4-6 und auch die Verweisung auf 3 Mos. 15, 16 kann eine Hülfe gegen trübe Gedanken sein, und ich habe an diese Worte gar Manche, die sich an mich wandten, erinnert. Es is eben leider so, wir tragen einen Sumpf in uns, dessen wir uns schämen müssen, so langs wir in diesem Leibe leben, so sehr auch der innere Mensch über alle Gemeinheit sich erhebt und von ihr nichts wissen will und mit der Sinnlichkeit seiner Natur kämpft." (Luthardt, 'Zur Einführung in das akademische Leben.' Leipzig, 1892, p. 16.)

A good deal of information about Germany from the point of view stated in "C. L. F.'s" letter may be gathered from Wittenberg und Hückstädt, 'Die geschlechtlich sittlichen Verhältnisse der evangelischen Landbewohner im Deutschen Reiche' (Leipzig, 1895). Is there any chance of any American speaking with the same openmindedness as Luthardt does, or will the canonization of this country be allowed to proceed till all the nations of the earth shall join in singing: "Sancta America, ora pro nobis"? O. T. T.

August 31, 1900.

PALESTINE EXPLORATION.

TO THE EDITOR OF THE NATION:

SIR: The *Nation* has placed all those who are interested in the exploration of Palestine in its debt by its clear accounts of the work in its progress, and by its frank comments upon the plans of the Palestine Exploration Fund. No doubt the unusual difficulties met with in this particular field—the reluctantly given firmans for very limited areas, the extremes of heat and cold which arrest the work for a time each year, and the impossibility of ascertaining beforehand the right spot for excavation where no great ruins stand as guides like those of Egypt and Assyria and other lands—have been sufficiently considered by you in speaking recently of "the great disappointment of archæologists and Bible scholars." Indeed, no people are so much disappointed as those who are giving time and money to this work; and the most disappointed of all is our young countryman, Dr. F. J. Bliss, who has not hesitated to say so to the Executive Committee, and to open the way to new arrangements.

The firman for the work at Jerusalem was once extended, and then nothing more could be done, although, going along the southern wall and turning the southeastern angle, Dr. Bliss had just reached the very climax of his undertaking, and it seemed only necessary to follow up the several visible clues to gain at last the tombs of the kings. Considering the fact that these kings all had their chroniclers, and that the Scriptures contain what are confessedly extracts from those chronicles, what is more likely than that the tombs of David, Solomon, and the Judean kings will be found to contain records of vast importance? The same foundation for hope exists as to the kings of Israel buried in Samaria. As in Egypt, so in Palestine, the tombs are our chief quarry, and of them that at Hebron, with its embalmed body, if not bodies, is most promising of all. Mr. R. A. Stewart Macalister, who has been assisting Dr. Bliss, has shown himself a master of epigraphy, and there is every reason to feel that in him the Fund has a "lucky explorer" in its employ.

In response to your kind wish that "the Fund will persist in its search," I may say that our plans are always formed in advance of the expiration of any firman, and that the excavations are as yet only in their beginnings, for we have barely touched the great spaces beneath the Temple pavement at Jerusalem, and done nothing on the site of Solomon's palace, while there is a hundred feet of unexplored débris in the Tyropœon valley, and of two hundred *tells* we have examined only four, and those hastily, and there remain Samaria and Shechem and Capernaum and Jericho, and especially Sodom and Gomorrah, not to speak of a score of smaller places. The work on the surface has been successfully accomplished in our maps, and now excavation must go on for many years, perhaps long after other fields shall have been exhausted.

If the American School at Jerusalem, which was started before it gained its firman, shall succeed, its aid in the work of excavation will become most useful.

T. F. WRIGHT,
Honorary U. S. Secretary P. E. F.

THE LITERARY TASTE OF PUPILS AND THEIR VOCABULARY.

TO THE EDITOR OF THE NATION:

SIR: I was glad to see in a morning paper the beginning of quotations from an article by Mr. H. S. Pancoast in the September *Lippincott's*. I am sure that all teachers who have read it would rejoice to see the whole article quoted, even in piecemeal, by newspapers throughout the country.

Although the author addresses the general public, there are two points—one of more general, the other of more specific, character—which are pressingly worthy of the attention of teachers and of all who have to do with the working of schools.

(1.) The cultivation of taste must, it is true, ever remain largely the province of home and of social environment; but it is a question whether principals and school-boards have as yet had any adequate regard for the possible power of schools in developing this vital side of pupils' education. The problem is, of course, most difficult of definite handling. It depends upon the personality of the teacher. If the teacher lacks refinement, lacks taste, lacks good breeding, no amount of cut-and-dried injunction can avail. It seems that in at least one direction of good taste the schools might get better results, namely, in the matter of arousing and fixing a taste for the best literature. Here, also, nearly all depends upon the teacher, but it can be fairly tested, and tested by a written examination, whether or not a teacher has some true literary taste. All schools are professing to teach literature; but is it not evident what a wooden process this must be unless the teacher himself has a real feeling and appreciation, a keen sense and a sure ear, for the true ring of a good book or a great poem? My personal conviction is that a dull, uninspiring, dissecting-room process of dealing with literature is the weakest spot in most of our schools. Far more than knowledge of facts, which can come at any time, is the begetting of love and true taste for that which is fine and ennobling. This sounds well, but we have not accepted its truth. Let it be confessed that the high school has not done its work if its graduates, no matter how much algebra or how many facts of history and chemistry they may know, prefer the literature of yellow journals to Shakspere and John Fiske.

(2.) The second point refers to the meagreness of young America's vocabulary. Any teacher of freshmen can bear witness to the lamentable lack of knowledge of English words on the part of the average young men who are now coming up to college. Their poverty of vocabulary is perhaps especially evident to those of us who have to correct translations, done into English from other languages. It was, however, from a professor of chemistry, who had just looked over some first examination papers, that I happened to hear the last complaint on this score. "These young men," he said, "do not seem to have command of enough words to describe an experiment." So much the greater is their lack, as Mr. Pancoast laments, of such words as belong quite distinctly to literature. Now it is true, as he implies, that "the character and extent of the vocabulary of a child" depend very largely upon "daily association"; yet surely the schools, especially in the upper grammar grades, ought to do more than at present in the way of enlarging the scope and fixing the accuracy of their pupils' knowledge of the English words that are found in the best authors. Indeed, there seems to be retrogression in recent years. One is tempted to think that the general elimination of such old books as "The Scholar's Companion," or even of the much-despised study of the dictionary, may prove to be, in default of fitting substitution, a distinct loss.

J. H. DILLARD.

SHAKSPERE'S USE OF THE BIBLE.

TO THE EDITOR OF THE NATION:

SIR: Prof. Bright, in *Modern Language Notes*, volume xiv., p. 372, suggests a new interpretation of the passage in "Lucrece," vv. 137, 138, where Tarquin for a moment "justly controls his thoughts unjust." In the lines,

> "Then looking scornfully he doth despise
> His naked armour of still slaughtered lust,"

he takes *still* as a predicate adjective with the participle *slaughtered*, and understands the words to say that the king now sees and despises the flimsiness of his argument in favor of lust; "his naked armour" referring to his naked argument. But "still slaughtered" in the sense 'killed so that he will lie still' is not only awkward Elizabethan syntax, it also does not suit the context, for Tarquin's conscience-scruples are only temporary.

The whole passage becomes clear and apposite if taken in connection with Romans xiii, 12 (I quote from Tindale's version):

> "The night is passed and the daye is come nye.
>
> "Lett us therfore cast awaye the dedes of darkness and let us put on *the armour off light*, lett us walke honestly as it were in the daye light: nott in eatynge and drynkynge *nether in chamburynge and wantonness*, nether in stryfe and envyinge, but put ye on the lorde Iesus Christ. *And make not provision for the fleshe to fulfull the lustes off hit.*"

As armour means 'weapon' in Elizabethan English as well as 'defensive protection,' may Shakspere not have had in mind this so apposite Biblical passage when he wrote "armour of still slaughtered lust"? He has just spoken of Tarquin's having drawn his falchion (p. 176) with which to strike the flint to light his candle. Instead of 'armour of light' he thinks of the naked sword as 'armour of lust,' *i. e.*, weapon of lust. The epithet "still slaughtered," the reading of the Quartos, is especially fitting in connection with v. 168, "lust and murder wakes [=watches] to stain and kill." Such adjectives as *slaughtered* with the -ed in the sense of 'full of,' and equivalent to a New-English active participle in -ing, are so common in Elizabethan English that this one scarcely deserves remark. One need only recall "a custom more honoured [*i. e.*, honouring] in the breach than in th' observance." "Still" will then have its usual Elizabethan sense of 'always,' and the whole passage will run: "He despises his naked weapon of lust (which ever wakes to stain, and kill), and for a moment puts on the 'armour of light,' abhorring the provision he has made for the flesshe to fulfull the lustes off hit."

It seems to me so difficult to give Shakspere's words any other interpretation that I should add this passage from the "Lucrece" to the numerous others to be found in his works which go to show his familiarity with Bible phraseology. MARK H. LIDDELL.

EAST ORANGE, N. J., August 20, 1900.

Notes.

Houghton, Mifflin & Co.'s autumn list presents the 'Autobiography of a Journalist,' by William J. Stillman, in two volumes; 'Theodore Parker, Preacher and Reformer,' by the Rev. John White Chadwick; 'A Century of American Diplomacy,' by John W. Foster, ex-Secretary of State; 'The United States in the Orient: The Nature of the Economic Problem,' by Charles A. Conant; 'Numbers and Losses in the Civil War in America, 1861-1865,' by Major Thomas L. Livermore; 'The *Monitor*, and the Navy Under Steam,' by Lieut. Frank M. Bennett, U. S. N.; 'The *Mayflower* and her Log, July 15, 1620—May 6, 1621,' by Azel Ames M.D.; 'An American Anthology, 1787-1899,' selections, by Edmund Clarence Stedman, illustrating his critical review of American Poetry in the Nineteenth Century; a new edition of the Works of Thomas Wentworth Higginson, in seven volumes; a new edition, enlarged to date, of William I. Fletcher's 'Index to General Literature,' and, from the same hand, an abridged edition of 'Poole's Index to Periodical Literature,' confined to thirty-six leading periodicals from their beginning to January 1, 1900; 'Counsel upon the Reading of Books,' University Extension lectures by H. Morse Stephens and others; 'The Fields of Dawn, and Later Sonnets,' by Lloyd Mifflin; 'Orpheus: A Masque,' by Mrs. James T. Fields; 'The Prodigal,' by Mrs. Mary Hallock Foote; 'The House Behind the Cedars,' by Charles W. Chesnutt; 'The Last Refuge: A Sicilian Romance,' by Henry B. Fuller; 'Petersburg Tales,' by Olive Garnett; 'Russia and the Russians,' by Edmund Noble; the third volume of 'Letters to George Washington,' edited by Stanislaus Murray Hamilton; 'Mountain Playmates,' the story of an abandoned farm in New Hampshire, by Helen R. Albee; 'The Life and Literature of the Ancient Hebrews,' by Lyman Abbott, D.D.; 'The Book of Saints and Friendly Beasts,' by Abbie Farwell Brown; 'Squirrels and Other Fur-bearers,' by John Burroughs; 'The Woodpeckers,' by Mrs. Fannie Hardy Eckstorm; 'The Biography of a Baby,' by Miss Milicent W. Shinn; 'Fact and Fable in Psychology,' by Prof. Joseph Jastrow; 'A School History of England,' by J. N. Larned; Henry James's 'Little Tour in France,' in a new edition, illustrated by Joseph Pennell; an illustrated edition of John Fiske's 'Old Virginia and her Neighbors'; a "Cambridge Edition" in one volume of the Complete Poetical Works of Elizabeth Barrett Browning; and a new cabinet edition of Keats's Poems in one volume.

Six of the projected "Century Classics" will be issued in October by the Century Co., beginning with Bacon's Essays, with an introduction by Prof. George E. Woodberry.

McClure, Phillips & Co. will publish this month an authorized translation of Leroy-Beaulieu's 'Rénovation de l'Asie.'

'The Art of Translating,' by Dr. Herbert C. Tolman of Vanderbilt University, is soon to be issued by Benjamin H. Sanborn & Co.

A series of letters describing Taku, Tientsin, Pekin, and other leading Chinese cities, composes 'The Attaché at Pekin,' by A. B. Freeman Mitford, nearly ready from the press of Macmillan, from whose superabundant autumn list we make the following further selections: The first volume of Russell Sturgis's illustrated 'Dictionary of Architecture and Building,' A—E; 'French Sculptors of the 18th century,' by Lady Dilke; 'Eighteenth-Century Color Prints,' by Julia Frankeau; 'Van Dyck and his Works,' by Lionel Cust; 'Botticelli and his School,' by G. N. Count Plunkett; 'Fra Angelico and his Art,' by the Rev. Langton Douglas; 'Frederic Lord Leighton,' an illustrated chronicle, by Ernest Rhys; 'Roman Art: Some of its Principles and their Application to Early Christian Painting,' by Franz Wickhoff; 'German Bookplates,' by Count zu Leiningen-Westerburg; 'The Beginnings of Poetry,' by Prof. Francis B. Gummere of Haverford College; 'William Shakspere: Poet, Dramatist, and Man,' by Hamilton W. Mabie; 'Studies and Appreciations,' by Prof. Lewis E. Gates of Harvard; 'The Clergy in American Life and Letters,' by the Rev. Daniel D. Addison; 'The Hoosier Writers,' by Meredith Nicholson; 'More Letters of Edward FitzGerald,' edited by W. Aldis Wright; 'Coventry Patmore, his Family and Correspondence,' by Basil Champney; 'Rulers of the South: Sicily, Calabria, and Malta,' by F. Marion Crawford; 'The Venetian Republic: Its Rise, its Growth, and its Fall, 421-1797,' by W. Carew Hazlitt; 'A History of Rome,' for high schools and academies, by George Willis Botsford of Harvard; 'South Carolina in the Revolution, 1775-1780,' by Edward McCrady; 'Stage-Coach and Tavern Days,' by Mrs. Alice Morse Earle; 'Along French Byways,' by Clifton Johnson; 'Spanish Highways and Byways,' by Katharine Lee Bates; 'The Antarctic Regions,' with maps and illustrations, by Karl Fricker; 'The Peace Conference at The Hague, and its Bearings on International Law and Policy,' by Frederick W. Holls; a 'Dictionary of Philosophy and Psychology,' in three volumes, edited by Prof. J. Mark Baldwin; 'The Crisis,' by Winston Churchill; and 'Richard Yea and Nay,' by Maurice Hewlett.

Brentano's catalogue of forthcoming works embraces 'The Idea of Tragedy in Ancient and Modern Drama,' by Prof. W. L. Courtney; 'Tales from Tennyson,' by the Rev. G. C. Allen, with photogravure illustrations; a new translation of Henri Mürger's 'Bohemian Life'; 'Impressions,' essays by Pierre Loti, with an introduction by Henry James; 'James VI. and I.: A Royal Rhetorician,' his treatise on Scottish Poesie, etc., edited by Robert S. Rait; 'Old London Taverns,' by Edward Callow; 'The Story of an Ocean Tramp,' by Capt. Charles Clark; 'The Mind of the Nation: A Study of Political Thought in the 19th Century,' by Marcus R. P. Dorman; and Erasmus's 'Colloquies,' in three volumes, and 'In Praise of Folly.'

'James Martineau: A Study and a Biography,' by the Rev. A. W. Jackson; a 'Life of Francis Parkman,' by Charles Haight Farnam; and an edition of Omar's 'Rubâiyât,' containing the versions of FitzGerald, Whinfield, and McCarthy, edited by Jessie B. Rittenhouse, are announced by Little, Brown & Co., Boston.

Among the relatively popular works in preparation at the Clarendon Press are 'Celtic Folklore: Welsh and Manx,' by John Rhŷs; 'British Jurisdiction outside the United Kingdom,' by the late Sir Henry Jenkyns; 'Legislative Methods and Forms,' by Sir C. P. Ilbert; 'Studies in History and Jurisprudence,' by the Rt. Hon. James Bryce; 'English Etymologies,' by W. W. Skeat; 'An Historical Primer of French Phonetics,' by Margaret S. Brittain; 'The Civil and Criminal Procedure of Cicero's Time,' by A. H. J. Greenidge; and 'The Polyphonic Period of Music,' by H. E. Wooldridge.

Of hopeful origin is Dr. Edward Leigh Pell's 'The Bright Side of Humanity,' "the first serious attempt that has been made to present the distinguishing noble traits of all races," forthcoming from Richmond, Va., through the B. F. Johnson Publishing Co.

'Yawps and Other Things,' poems by William J. Lampton, is to be published by Henry Altemus Co., Philadelphia.

'The House of Commons,' by Sir Richard Temple (New York: M. F. Mansfield & A. Wessels), is a small volume intended to give an idea of the English lower House as it exists to-day. The author was a member of Parliament from 1885 to 1895, and he offers some account of the House considered as a club; the precincts and buildings; life in Parliament; the manners and customs of the House; leading figures in Parliament, etc. Some of the information in the book is not to be found elsewhere, *e. g.*, that relating to the hours of Parliamentary sittings, "questions," and to the peculiar system of "cheering," organized and unorganized, which has grown up in the House of Commons and probably exists in no other Parliamentary body in the world.

'The Nicaragua Canal,' by William E. Simmons (Harpers), is an illustrated volume, treating not merely of the canal, but of the people of Nicaragua, and their country, government, and history. It is this latter part of the book which makes it valuable, the author having studied his subject on the spot. The mixture of the Spanish and Portuguese with the native races throughout Central and South America has produced at once a general type and local varieties. The Mexicans differ from the Brazilians, and the Venezuelans or Chilians from both, though, to the Anglo-Saxon eye, the specific differences are not at once apparent. The Nicaraguans, according to Mr. Simmons, are remarkable for their politeness, kindness, hospitality, good-nature, and joviality. These are traits, however, of Indians and half-breeds; the Spanish creoles are different. The half-breeds seem like a gentler and more amiable Spaniard—evidently an inferior race, specially fitted by divine Providence to be bullied and "assimilated" by their betters.

We had occasion to praise, on its first appearance eight years ago, Mr. Edward Q. Keasbey's novel treatise on 'The Law of Electric Wires in Streets and Highways,' which now enters its second edition, enlarged and revised (Chicago: Callaghan & Co.). This is a consideration of a purely modern branch of law, of which the most recent development has come from the multiplication of electric surface railroads. Mr. Keasbey was, we believe, the first writer to collect and classify the law and precedents on this subject; and his work continues the leading authority. The new edition pays special attention to the power to grant franchises, the nature and extent of municipal control of the use of streets for electric wires, and the condemnation of private rights.

Mr. John H. Ingham now gives us a text-book even more novel in one respect, that the subject he treats of is as old as the law itself. 'The Law of Animals' (Philadelphia: T. & J. W. Johnson & Co.) in his hands becomes a serious and dignified consideration of the great mass of law relating to animal life that has been hitherto very much neglected. That the offspring of cattle belong to the owner of the dam, but the swans to the owners respectively of cock and hen because the marital fidelity of the male ennobled him above other beasts, that a dog "is entitled to one bite," and a few like legal curiosities remain in the memory of the average student. The announcement in court, "If your Honor pleases, this is a cow case," never fails to arouse an idle interest in the spectators; but we are here made aware for the first time of the immense interest modern law takes in animals. The statute against cruelty to them at once opens up a wide field to the imagination. Another may be guessed at from the revolution in transportation which has put the freighter in place of the drover. Few law books are in themselves entertaining. This has a real interest for the lay reader, and is capable of easy comprehension by any one, while being well arranged, well annotated, and well indexed for the practitioner.

'The Organization and Management of Business Corporations,' by Thomas Conyngton (New York: The Ronald Press), is intended by the author "as a handy work of reference for the lawyer and a manual of information for the non-professional man," especial attention being given to a comparison of the respective provisions of the laws of New York, New Jersey, Delaware, and West Virginia. Such a book is in one way labor lost, for the great pains spent in the analysis are nullified at each legislative session. Otherwise this will be found suggestive in many ways, and not least of all to practising lawyers.

'The American Business Woman,' by John Howard Cromwell (Putnams), addresses itself entirely to women, in an endeavor to teach them in a serious but readable way how to handle bank accounts and to deal with real and personal property, giving cautious advice as to the general principles of investment. The author laments the ignorance among many women of an even elementary knowledge of these matters. Attentive perusal of the book could not fail to improve the mind and capacity of any woman who desired to learn.

'La Vie Judiciaire à New York,' by M. Émile Stocquart, Avocat à la Cour d'Appel à Bruxelles (Brussels: Alliance Typographique), is an address, in pamphlet form, delivered in that city after an eighteen months' sojourn in this country. An abounding good-will towards our bar should disarm criticism of the author's failure perfectly to understand our legal system or to summarize what is most noteworthy in it. His references to our Bar Associations are especially polite—doubtless affected by the recollection of the hospitality of the American Association, of which he and his associates were guests at Buffalo, where he was assured that Belgian banknotes would not pass current! The following observation, however, were it made by any one else, would seem ironical: "L'influence du Barreau sur le choix des juges est considérable. À fin d'empêcher la politique de se mêler de choses qui doivent lui rester étrangères, il est devenu d'usage de donner à la *Bar Association* presque un droit de présentation; elle dresse un liste, désigne ses candidats, et, chose plus importante, réussit à les faire nommer"!

'A Naval War Code,' prescribing the laws and usages of war at sea, has been compiled by Capt. C. H. Stockton, U. S. N., President of the Naval War College, approved by the President, and promulgated by the Secretary of the Navy. It is packed in twenty-three pages of open print, and is brought down to date, as is evidenced by art. 3, prohibiting the launching of projectiles or explosives from balloons for five years, in accordance with the Declaration at The Hague, this country assenting. Compression has perhaps been carried too far in the closing sentence: "This rule does not apply when at war with a non-contracting Power [which attempts such balloonery?]." Article 5 deals with the treatment of submarine telegraphic cables.

The *Studio* issues a special summer number, devoted to 'Modern British Water-Color Drawings,' with a slight text by A. L. Baldry, and numerous illustrations in black and white and in color. The excellence of the reproduction only accents the more sharply the essential lack of distinction of the originals, of which no one seems to strike any high or fine note. They show a good deal of ability of the sort common in magazine illustration, but little more, and on the whole their effect is that of a monotonous and depressing mediocrity.

'Through Africa,' the most noteworthy article in the *Geographical Journal* for August, is mainly an account by Mr. E. S. Grogan of the region just north of Lake Tanganyika, through which he passed on his way from the Cape to Cairo. It is interesting for both political and geological reasons: political, on account of the encroachments of the Germans on the Free State territory, their post on the south point of Lake Kivu, according to our traveller, being "at least forty miles over the treaty boundary." The geologic interest consists in the numerous evidences of a comparatively recent upheaval of the region, while "the old lake bed is rendered impassable by pits of fire; and huge jets of smoke, shooting up from all directions, bear witness to the extent of the volcanic activity." The last eruption was some five years ago, and so great that the lava-stream was fifteen miles in width and piled in places with huge blocks of lava and ash to a height of thirty feet, and so sudden that "whole herds of elephants were destroyed; I myself saw the bones of one that had been forced up to the top by the edge of the stream." In the plain to the north of the group of six volcanoes—two are active and two are so high that nearly every morning there was snow on them—owing to the porous nature of the ground "there is no water; yet in spite of this there is an enormous population, the necessary water being obtained by tapping the stems of the banana palms." The forests on the slopes of the volcanoes are so wildly luxuriant that an elephant could not be distinguished at a greater distance than six feet, making the hunting them not only extremely dangerous, but almost impracticable. On one occasion, when just entering the great Nile swamp, the prodigious number of elephants "formed a serious impediment to our march, as they refused to move out of the way. Nearly every morning we wasted an hour or two shouting and throwing stones at solitary old tuskers and herds of younger elephants." Among the inhabitants of the Kivu region was a tall race "with the long arms, pendant paunch, and short legs of the ape, pronouncedly microcephalous and prognathous." They are held in great contempt by the other natives, and are decidedly nearer the brute than the pigmies of the great forest.

Volume ii. of the Annals of the Lowell Observatory has recently been published. The first part is devoted to researches relating to the form, rotation, surface detail, and general phenomena of Jupiter and its satellites. The observations were made at Flagstaff, Arizona, in 1894, by William H. Pickering, who devised the methods of these special researches upon the Jovian system, and in 1895, by A. E. Douglas, who carried through the mathematical and analytical part of the investigations to definite results. They constitute the first long series of physical observations of Jupiter's satellites yet published. The latter portion of the volume contains a report of observations of Mars made in 1896, at Flagstaff, and in 1896-97 at Tacubaya, Mexico. It begins with an account of the polar caps, the most conspicuous and significant objects on the planet, and then presents the micrometric measures of diameters and positions of markings. Lists of the canals and oases seen during the opposition follow, and, finally, there are several chapters bearing upon the meteorological condition of the planet. The observers were Percival Lowell and A. E. Douglas, assisted by Miss W. L. Leonard and D. A. Drew. The volume is copiously illustrated, most of the plates being facsimiles of drawings by the different members of the staff, and is accompanied by a new map of Mars.

A large amount of what is known of the Resources of the Sea is to be credited to the reports of the Fishery Board for Scotland. The investigations and experiments instituted by this board have been of such character and such extent, and have been conducted in such a manner, as to demand the attention of fishery interests everywhere. And in addition to the discoveries and records of importance in direct connection with the fisheries, science has been enriched by many of the more technical contributions outcoming from the ordinary duties of the *Garland*, or other vessels under the Board's control. The Eighteenth Annual Report, for 1899, is divided into three, the General Report, the Report on Salmon Fisheries, and that on Scientific Investigations. The last is itself an octavo volume of 407 pages, with many illustrations, and is filled with accounts of the influences of trawling, of net and of line-fishing on the abundance of the fishes, with treatises on the parasites and on the fauna generally, and with notes on the life histories of various forms, on the currents, statistics, and other matters pertaining to the interests of the fisheries, the fishermen, and the consumers.

While English scholars have produced a practically perfect map of the cis-Jordan districts of Palestine, the Germans have now undertaken the same task for the territory east of that stream. For several years Dr. G. Schumacher, a civil engineer of Haifa, under the auspices of the German Palestine Society, has been making the necessary surveys, and in the last issue of the Society's *Zeitschrift* (vol. xxii, No. 4) is found the first sheet of what promises to be the classical chart of the trans-Jordan country. The scale is 1:152,000. This first sheet of the series bears the special title "Dschōlân und Westlicher Haurân," and covers both the historical and the present period. Its wealth of details is remarkable, but readily understood when we are told that the beginnings of the researches of which the full fruits are here given go back to the year 1885. An illustrated descriptive article by Schumacher accompanies the chart. Both map and article contain an abundance of new material.

The Strassburg *Post* has compiled complete statistics of the attendance of women at the universities of Germany. The total for the last winter semester was 664, and for the summer term now closing 618. This seeming decrease is owing entirely to restrictions enforced in Berlin, where the attendance of women at present is only 293, while during the preceding term it was 431. The total at the other universities is 325, while it was 258 in the winter. In Switzerland the total woman contingent is 937, and of these 555 are full-fledged candidates for degrees. The largest number, namely, 353, is furnished by Russia, followed by 65 from Switzerland, 53 from Germany, 25 from Bulgaria. Only 7 are from the United States. Switzerland has ventured upon a noteworthy innovation by permitting women docents. At the University of Geneva Miss A. Rodrigue recently acquired the right of delivering lectures in the natural-science faculty, and in the Academy of Neuenburg Mrs. M. Zebrowski has announced two courses of lectures for the next term in the literary department.

—*Scribner's* for September has an interesting "Personal Retrospect of James Russell Lowell," by W. D. Howells. To any one who knew Mr. Lowell, this portrait will bring him vividly to mind. It is drawn with all Mr. Howells's delicacy of literary touch, reinforced by a strong sentiment of friendship, and we may, perhaps, say veneration. The article is specially valuable as being written by one who did not sympathize with Lowell at all points. Mr. Howells, coming to Cambridge from that newer America of which Lowell liked to dream, but of which he really knew very little, judged him in his own way, and hence this paper is utterly different from anything that could have been written by a New England friend or neighbor. It is the tribute of a friend, and of a friend who felt all his greatness; but there is less "locality" in it than there could have been in any similar attempt by a New England admirer. Mr. Howells says in conclusion: "He did not, indeed, make one impression upon me, but a thousand impressions, which I should seek in vain to embody in a single presentment." This sketch is virtually the reflection of impressions of an intimate sort, so that a great part of Lowell's essential variety—inherent power, always showing itself in some new and unexpected form—is not made evident. Mr. Howells's interest is not in his friend as a public man—if it had been, we should not have had the present paper; but what he says might be supplemented and reinforced, if there were any one equal to the task, by some account of the manner in which Lowell seemed to tower above his fellows when he made some memorable appearances in public. If, for instance, he presided at a public dinner, what lingered in the memory was what he said, the witty way in which he called people up to speak, the completeness—possibly in the minds of some of the others, wishing also to cut a figure, too thoroughgoing—with which, through his wit and capacity, he dominated the whole affair. On one occasion, when he went before a Congressional committee to be examined as a witness on the subject of international copyright, it was amusing to see how all the functions of the court and jury gradually embodied themselves in the witness, so that everybody felt, when he had finished, that he not only had testified to the great distinction and entertainment of everybody present, but had also decided the cases. We have no doubt that other instances in plenty might be recollected; and when they had all been gathered together and compared with Mr. Howells's reminiscences, the total result would only fortify the statement, that he made upon those with whom he came into contact a thousand impressions, and that we shall not again "look upon his like."

—Prof. John Perry, in *Nature* of August 2, has opened a discussion which ought to prove important. His 'Calculus for Engineers' was a pretty radical departure in mathematical teaching. It was difficult to approve of teaching only such fragments of mathematics as the engineer could not possibly dispense with; but one must acknowledge that it was a work of thought, of something like power. Now, in a page and a half, he considers the general principles that ought to govern mathematical teaching, and then proceeds to draw up in a page of fine print a scheme of instruction headed "Practical Mathematics: Elementary Stage." He solicits criticism from three classes of persons: first, from those who think his method fit only for evening classes; second, from those who think it should be adopted in every school; third, "from other persons." We cannot disregard the summons in this third clause to testify concerning this universal interest. Let us say, then, that the destructive part of Prof. Perry's doctrine, vigorous as it is, is not a bit exaggerated. No other subject ever was, from the beginning of the world, so absurdly taught as mathematics in the old schools; and the new pedagogical methods have in this department been at their worst. In Professor Perry's constructive proposals, there are excellent features; but they relate to details into which we have no space to enter. He belongs to the generation of those who think that the final end of education is to enable students to make money, and who look upon pure science with some contempt, except so far as it may subserve that great aim of life. Such, at least, is the general impression his various writings have left upon us. In his last article, for instance, he says: "Those engineers who can most readily apply mathematics to engineering problems, almost invariably descend to the position of teachers and professors in schools and colleges." This may be taken as a statement of the obvious truth that those who delight in the exercise of intellectual powers more than in the business side of the profession with its rewards, attach themselves to positions where they can enjoy their preference. But the word "descend" applied to a passage from money-making to the cultivation of mathematics betrays Professor Perry's opinion about a fundamental question of ethics. Men of science of the old school will say that here is the worm at the root that threatens the decadence of the twentieth century.

—Still, the most elementary mathematics ought, no doubt, to be taught in a practical spirit, mainly. More pertinent, therefore, is another general objection, namely, that Professor Perry's scheme is a mere piece of tinkering, not professing to ground itself upon any thorough analysis of the evil it seeks to remedy, not by any means erected as an engineer like Professor Perry would construct a real suspension bridge, resorting to every light of science, but rather in the old no-method by which dark ages built that crazy structure that the very asses balked at, the *pons asinorum*. Broken up into educational junk, it would afford some valuable half-ideas and lesser fractions. We can only give a single example of what we mean. Professor Perry is quite right in protesting against the notion that logarithms should not be taught until their theory is first mastered. One might as well forbid people to take photographs until they perfectly understand the molecular actions involved. But the other half of this idea is, that you should never teach the theory of logarithms until interest has been excited by seeing what marvels they will accomplish; and, in general, you should try not to teach any theory, especially if it be one requiring a good deal of effort to comprehend, until the subject it explains has been, as far as may be, brought out of cloudland, so that there may be an intellectual incentive to seeking the why of it. This is particularly important all through mathematics. Not only is it permissible, as Professor Perry demands, not to keep the Pythagorean proposition a secret until it is proved, but it should be suggested and applied to measurements of some triangles in such a way as to create a doubt as to its exactitude. Then the demonstration will mean something.

—An interesting summary of the information regarding the northeasterly portions of the American continent which was obtainable in England at the end of the sixteenth century, is provided by the facsimiles of the more important English maps drawn between 1578 and 1600, which illustrate Mr. Miller Christy's 'The Silver Map of the World' (London: Henry Stevens, Son & Stiles, pp. 71 and 10 maps). Mr. Christy has written a very suggestive treatise on a silver medallion which appears to have been designed to commemorate Drake's circumnavigation of the globe, by the same hand that produced the beautiful map dedicated by "F. G." to Richard Hakluyt, and published in the latter's edition of Martyr's 'Decades,' issued in Paris in 1587. Mr. Christy finds a cartographic test in the representation of the discoveries made by Frobisher on the Labrador coast in 1576-78. Frobisher and the map-makers who worked under his immediate inspiration realized the actual relations of the various points of land which he encountered, and succeeded in rearranging the previously accepted cartography so as closely to approximate the real geography of Greenland, Iceland, and Labrador. A generation later, however, the cartographers began to find difficulty in distinguishing between what Frobisher had seen and what he had surmised. The result was confusion in the whole subject, which ended in the location on the maps of Frobisher's Straits in Greenland, making an island of the point of that peninsula. This cartographic error persisted, despite the explorers and the whalers, on maps drawn within the last forty years, and was not permanently done away with until the publication of Mr. C. F. Hall's discovery of the remains of Frobisher's settlement and arctic gold refinery, in the bay north of Hudson's Straits. In elucidating the origin of this error, Mr. Christy uses the evidence of the contemporary maps, of which the originals are available only in the larger libraries. Two of these maps are placed within the reach of students outside of London for the first time. He has secured a projection of the North Atlantic portion of the Molineux globe, which is sometimes mentioned in geographical discussions, but very rarely examined, and he also reproduces an extremely interesting working sea-chart drawn by William Borough for the use of Frobisher in 1576, which had not before been known.

—Of more than ordinary "presence," in its large-folio dress, and of content to justify so expensive setting—which includes fifty-five large full-page illustrations from Rinehart's admirable (if rather "galleried") Indian photographs—'The Indians of To-day,' by George Bird Grinnell (Stone), is a worthy contribution to our too-small catalogue of *Indiana;* and, in its due subdivision, a large contribution. It is not, indeed, "scientific," in the severe sense. It harbors more inexactitudes than ethnology, strictly applied, could excuse; and its pitch is not critical, but soberly "popular." But, unlike much that is "popular," it—deserves to be. Its whole point of view is from that height of tolerance taught not by "mere learning," but only by knowledge—knowledge, not alone from intelligent reading, but from a personal experience few modern writers upon the American aborigine have equalled and still fewer have surpassed. Written straightforwardly and unaffectedly, from broad comprehension and no mean insight, this presentment is most readily classified as a "common-sense, matter-of-fact" view of the surviving Indian. The only structural criticism to be made is that the writer's deep familiarities are with the nomad Plains Indians; as to the sedentary (and nomad) tribes of the Southwest, his equipment is rather palpably hearsay evidence, and not always from the most authoritative witnesses. If, "when the white men first set foot in America they found it inhabited by any people who were absolutely primitive," that was not the character of its aboriginal population on the average. Nor is it at all true that "all used movable tents or lodges." An overwhelming majority of the natives in America did not use any such devices, and even in what is now United States a very large population did not. There were hundreds of ancient "cities" here, stone-built, castellated, many-storied, so long abandoned that they were a mystery even in the folk-lore that was vital when Columbus was born; and hundreds of others still occupied. But, for these superficial flaws, and too much acceptance of the Southwestern tribes from the reports of agents neither scientific nor acquainted, Mr. Grinnell largely atones by a generic comprehension of Indians anywhere. Nothing could be more quiet or more true than his arraignment of our "Indian system" in general, and particularly of the great print-factory schools, remote from home, where Indian children are spoiled as Indians and not, of course, converted into whites—the same philanthropic, stupid, far-reaching tragedy of which Zitkala-Sa has so naïvely yet so poignantly drawn a simple personal outline.

—With parts 28-32 the important 'Dictionnaire Général de la Langue Française' of MM. Hatzfeld, Darmesteter, and Thomas (Paris: Ch. Delagrave) comes to an end. It makes two large octavo volumes of 2,272 double-column pages, besides introductory matter of 28 pages, and a supplementary Treatise on the Formation of the French Language in 289 pages. As is well known, M. Darmesteter died early in the course of publication, but his colleagues have maintained the high authority of the work, which has been a boon to the editors of the Oxford English Dictionary. A severe compression has been exercised, but the Dictionary abounds in illustrative quotations, dated and located with particularity, the collection of the "Grands Écrivains" being as a rule referred to when the author cited is found in it. The pronunciation is indicated, and the etymologies in brief, with little or no discussion, though this is the scholarly feature *par excellence.* To the admirable Treatise we may return hereafter. We shall here only direct attention to it for the sake of some convenient lists (sometimes exhaustive) of words derived from Latin, Greek, Gaulish, English, Germanic, etc., etc., and of the principal adverbs, prepositions, and interjections; for the detailed examination of affixes and prefixes; for the history of pronunciation, etc. The English list just mentioned is confined to words which appear to have been definitively naturalized in France; the editors regretting that their countrymen's love of novelty has not caused them always to stand out sufficiently. It begins with *abolitioniste* and ends with *yacht,* while intermediate are *ballast, banknote, bifteck* and *rosbif, boston, boxer* (v.), *cab, club, cold-cream, confort, drawback, gentleman, hourra, jockey, jury, lunch, macadam, meeting, pamphlet, pouding, reporter* (s.), *revolver, schooner, snob, speech, sport, steeple-chase, tunnel, verdict, vote,* and other forms more or less calculated to make the French Quintilian stare and gasp. But they form a curious politico-sociological chapter. "Job" is not in this list, though the French still have the thing if not the name, as one of their statesmen lamented.

—*Yacht* occurs in Part 29 (which contains, by the way, all of W and X, filling but a third of a page each, and Y, half a page; while U, in Part 28, owing to the fact of our prolific negative un- being unknown to French, needs but six pages). The pronunciation is far from established, with a choice between "hyakt," "hyak," and the English "hyot." *Tramway* has its pronunciation unaltered, and this may partly account for its admission by the Academy as early as 1878 along with *tomahawk* (pronounced as in English but without the aspirate), which, nevertheless, figured in Chateaubriand's 'Atala,' and the indispensable *truisme.* The same year witnessed the tardy recognition of *vendetta* from the Italian. On the whole, the English borrowings are but little modified or assimilated in spelling—not more than the German *Vermut* in *vermout* or *Wiederkomm* in *vidrecome;* less than the Dutch *wimbelkin* in *vilbrequin.* By the dropping of the hyphen, *coaltar* becomes, in a French list, almost unrecognizable. Five-sixths of the substantives are masculine, and those which are feminine would seldom fail of being distinguished by one familiar with French rules of gender. From the Slav a very small group of vocables has been taken over, and we may write *tsar, tzar,* or *czar, ukase* or *oukase. Veto,* from the Latin, is pronounced as if the *e* had the acute accent. *Vif-argent* sounds the *f* like *f* or like *v.* In *vide-bouteille* the first word becomes dissyllabic in verse, as happens in other like instances. Numerous compounds of this sort occur in the parts before us. Those beginning with *tire* (from the verb *tirer*), which go back as far as 1549, are still being multiplied, whereas the *traine* series is quite obsolete and uncreative. In conclusion, we are glad to record the fact that this Dictionary has, in addition to the Grand Prix Jean Reynaud, of 10,000 francs, awarded by the Institut, just received the Grand Prix of the present Exposition.

RECENT POETRY.

It is possible that the best memorial of what is called "Home Week" in our older States may turn out to be in volumes of dialect poetry which will preserve, better than any other monument, the traditions of the founders. Many such attempts will doubtless fail; they will be as monotonous as Bret Harte, or as bewildering as Kipling when he picks up phrases from all parts of the United States and mingles them all in the dialect of his 'Captains Courageous.' It is hard even for a modest and accurate man to write dialect without affectation; and, moreover, mere dialect soon palls or coarsens. It cannot be said that Mr. Holman F. Day, in his 'Up in Maine' (Boston: Small, Maynard & Co.), has wholly escaped these ills, but it is only fair to say that he has achieved unusual success in his effort to meet the pilgrims of "Old Home Week" and give them a taste of the vernacular. It is true that he awakens distrust at the outset by his title 'Up in Maine,' for if Maine is not "*Down* East," what becomes of the traditions of the fathers? It is true, also, that the preface of the Hon. C. E. Littlefield is so forced and labored as to make the reader wonder if this be the orator who took Congress by storm. But the lyrics themselves are so fresh, so vigorous, and so full of manly feeling that they sweep away all criticism; and the most commonplace things in the farmer's life take hold upon the human heart when the poet sings this winter song (p. 35):

THE STOCK IN THE TIE-UP.

I'm workin' this week in the wood-lot; a hearty old job, you can bet;
I finish my chores with a larntern, and marm has the table all set
By the time I get in with the milkin'; and after I wash at the sink,
And marm sets a saucer o' strainin's for the cat and the kittens to drink,
Your uncle is ready for supper, with an appetite whet to an edge
That'll cut like a bush-scythe in swale-grass, and couldn't be dulled on a ledge.
And marm, she slats open the oven, and pulls out a heapin' full tin
Of the rippin'est cream-tartar biskit a man ever pushed at his chin.
We pile some more wood on the fire, and open the damper full blare,
And pull up and pitch into supper—and comfort—and taste good—wal, there!
And the wind swooshes over the chimbley, and scrapes at the shingles cross grain,
But good double winders and bankin' are mighty good friends here in Maine.
I look 'crost the table to mother, and marm she looks over at me,
And passes another hot biskit and says, "Won't you have some more tea?"
And while I am stirrin' the sugar, I relish the sound of the storm.
For, thank the good Lord, we are cosey and the stock in the tie-up is warm.

I tell ye, the song o' the fire and the chirruping hiss o' the tea,
The roar of the wind in the chimbley, they sound dreadful cheerful to me.
But they'd harrer me, plague me, and fret me, unless as I set here I knew
That the critters are munchin' their fodder and bedded and comf'table, too.
These biskits are light as a feather, but, boy, they'd be heavier'n lead
If I thought that my hosses was shiv'rin', if I thought that my cattle warn't fed.
There's men in the neighborhood 'round me who pray som'w'at louder than me.
They wear better clothes, sir, on Sunday—chip in for the heathen Chinee,
But the cracks in the sides o' their tie-ups are wide as the door o' their pew,
And the winter comes in there a-howlin' with the sleet and the snow peltin' through.
Step in there, sir, ary a mornin' and look at their critters! 'Twould seem
As if they were bilers or engines, and all o' them chock full o' steam.
I've got an old-fashioned religion that calkilates Sundays for rest,
But if there warn't time, sir, on week days to batten a tie-up, I'm blest
I'd use up a Sunday or such-like, and let the durned heathen folks go
While I fastened some boards on the lintel to keep out the frost and the snow.
I'd stand all the frowns of the parson before I'd have courage to face
The dumb holler eyes o' the critters hooked up in a frosty old place.
And I'll bet ye that in the Hereafter the men who have stayed on their knees
And let some poor, fuzzy old cattle stand out in a tie-up and freeze,
Will find that the heat o' the Hot Place is keyed to an extra degree
For the men who forgot to consider that critters *have feelin's same's we.*

But the whole vigor of the strain does not come until the poet arrives in the wilderness, sings of "Drive, Camp, and Wangan," and celebrates that carnival of strength and daring which awaits the gangs of loggers in the Maine woods. It is the "head of a drive" who himself sings, who gives you words not to be found in the dictionary—such as "wangan," "peavy," "cant-dog"—and launches you upon adventures which need no Kipling to tell their tale: the "Rear o' the Drive," for instance (p. 142).

It is a curious fact that whereas, a year or so ago, the poets were all singing the praises of the Spanish war, there now appear on our table no less than five volumes of verse to urge strenuously the side of peace, and not one on the other side. First comes 'Liberty Poems, inspired by the Crisis of 1898-1900' (Boston: West), full of stirring lays against war by Henry Labouchere and Richard Le Gallienne in England, with William Lloyd Garrison, Ernest Crosby, John W. Chadwick, Hezekiah Butterworth, Edward Robeson Taylor, and many others in this country. Such a volume always shows great variety of excellence, with some inevitable mediocrity, as indeed does any miscellaneous collection; but it well preserves for future readers the wholesome reaction from a warlike period. Then come two volumes equally sincere, but of less average poetic ability, the one, "Advent of Empire," by the well-known labor reformer, Morrison I. Swift (Los Angeles: Ronbrooke Press), while the other is 'Chants for the Boers' by Joaquin Miller (San Francisco: Whittaker & Ray Co.). It is to be noticed that both these volumes are from the Pacific Coast, usually represented as the most warlike region of our country, and that the latter comes from an author whose first laurels were won in England, and who has always retained warm relations with his friends made there.

Still another Anti-Imperialistic volume is 'America, and Other Poems,' by Bernard Shadwell (Chicago: Donnelley). So eager is this writer to plant his moral that he puts the title-poem even on the title-page:

AMERICA.

A refuge for the oppressed. Now, God be praised,
Here they may live at peace. By her just laws
All men are free and equal. No more wars
For greed of gold or land. No standard raised
Driving armed hordes, by bloody fever crazed,
To deeds which, calm and sane, the mind abhors,
Sending their souls, in an unrighteous cause,
Naked before God's judgment seat, amazed.

Such was this country; but within the hour,
False creed of conquest luring her to ill,
She is become an armed, imperial power,
Crushing a weaker people to her will.
Let freedom's banner, then, to earth be hurled,
And raise the despot's flag of the grim Old World.

But England takes her share in the condemnation, and this is Mr. Shadwell's "Marching Song, on the Road to Kimberley" (p. 74):

We are marching to relieve you,
Cecil Rhodes,
Honor will not let us leave you,
Cecil Rhodes.
Seven thousand men in khaki—
Gunners, horse, and foot—but, hark ye,
Do you know the price we're paying,
Cecil Rhodes, Cecil Rhodes?
All the lives and all the treasure,
Cecil Rhodes?

Do you hear the rifles calling,
Cecil Rhodes?
Brave and honest men are falling,
Cecil Rhodes.
Bursting shell and shrapnel flying
Strew the earth with dead and dying.
Do you think that you are worth it,
Cecil Rhodes, Cecil Rhodes?
Is their blood upon your conscience,
Cecil Rhodes?

With these various Anti-Imperialistic poets may also be classed the late Mrs. Hilda Johnson Wise, whose fine face looks from the frontispiece of 'The Optimist, and Other Verses' (privately printed), with the affix, "Obiit December 13th, 1899." She thus deals with the pending questions of Expansion:

BALLADE OF EXPANSION, 1899.

Time was he sang the British Brute,
The ruthless lion's grasping greed,
The European Law of Loot,
The despot's devastating deed;
But now he sings the heavenly creed
Of saintly sword and friendly fist;
He loves you though he makes you bleed—
The Ethical Expansionist!

He loves you, Heathen! Though his foot
May kick you like a worthless weed
From that wild field where you have root,
And scatter to the winds your seed.
He's just the government you need;
If you object, why, he'll insist,
And on your protest "draw a bead,"
The Ethical Expansionist.

ENVOI.

Heathen! You must, you shall be freed;
It's really useless to resist;
To save your life you'd better heed
The Ethical Expansionist!

Mr. Robert Loveman's little 'Book of Verses' (Philadelphia: Lippincott) is by an author who earned from critics, by a previous volume, the perilous title of a "carver of cameos." The title is perilous, because it tempts an author to imagine every stone a cameo, and to feel that he is sure of fame in inverse ratio to the quantity he gives the public. Books of proverbs are not necessarily wiser than books of psalms; and books of gospel may be better than either. On the whole, Mr. Loveman has borne well the test of the cameo-carver, and if his little gems are rarely of great price, they are seldom worthless, though sometimes trivial. He is, perhaps, at his best, because simplest, in writing for children; and he does not altogether fail of impressiveness when he strikes a bold and deep note, as in this (p. 38):

THE SECRET.

Of one great secret Omar knew
Little as I, as much as you;
And Shakespeare's soul and Milton's brain
Perplexèd paused at death's domain.

Dear God, who gave us thought and breadth,
Divulge the mystery of death!
What suns shall light, what waters lave
The mystic shores beyond the grave.

Mr. Loveman furthermore reveals one of his sources of example in a tribute to Emily Dickinson (p. 32):

PROCLAMATION.

Robin in the red cravat,
When winter days are done,
A memorial meeting to
Emily Dickinson.

The humming-bird and butterfly
Will tell of her and weep,
But she can never heed them,
"Being just asleep."

Yet, after all, the young poet who seeks condensation is on the safer path. Leigh Gordon Gittner, for instance, in 'The Path of Dreams' (Chicago: Revell), is safe when she touches briefly, in a single verse, the perpetual problem of the unexplained kinship between flowers and the butterflies which haunt them (p. 92):

BUTTERFLIES.

As if a bed of bloom had taken wing—
Bright marigold, nasturtiums, zinnias gay—
They breast the breeze, or, lightly poising, cling
To other flowers not animate as they.

But when she deals with subjects more amply, she at once finds room for florid

Studies in John the Scot (Erigena): A Philosopher of the Dark Ages. By Alice Gardner. Henry Frowde. 1900. 16mo, pp. xii, 145.

An American scholar, writing for a small cyclopædia, thought it sufficient to describe Scotus as a "translator and author at the court of Charles the Bald." Could any good thing come out of the ninth century? Why inquire too curiously as to what any one had to say at a period when the few who tried to think could exercise their wits only upon high themes which they did not understand, and the finest spirits were dimly groping toward purer conceptions of what everybody professed to regard as most important? Yet a dark age may enjoy some glimmerings of light, and Erigena is supposed to have had as much light as any one had then. A new country, a new science, a coming civilization, need pioneers; such was John the Irishman, working so far ahead of his contemporaries that they knew not what to make of him.

Nor are modern critics always agreed as to his place, though his repute has grown. One poetic theory makes him a personage almost beyond human limitations, a splendid skeptic, who "sat as God, holding no form of creed, but contemplating all." Maurice calls him "one of the acutest metaphysicians of any century." Miss Gardner, with careful moderation, sums him up as "a devout agnostic, an eclectic philosopher, a recipient of the influences of the past, who, in many ways, anticipated the most fruitful ideas of the present age." The term agnostic, as we understand it, seems hardly justified. John's devoutness is as obvious as his independence; he quotes Scripture frequently, but always puts his own interpretation on it; his ideas are his own and nobody's else, and he seems satisfied with them, though he knows too much to push them too far. He has the eminently unmediæval idea of notional truth; it is useless to inquire, in supermundane matters, what absolutely is or is not, but proper to ask what we may most suitably think (since we must hold some opinion) on the subject—"not how things are either eternal or created, but for what reason they may be called both created and eternal."

He was out of touch with his age not only by the superior depth and breadth of his mind, but by its strongly Greek bias; without that, he could hardly have been a metaphysician. He was a transcendentalist and a mystic; and their mental processes are not always easy to follow. He had a "natural tendency to speculative thought, and the loose interpretation of dogma which naturally accompanied it, with a disposition to soar after ideals rather than to lay down laws." He held "that what we call evil is merely a privation of good, and has no positive existence." He thought that beasts have souls—here, in Miss Gardner's words, is a point for the S. P. C. A.—and "some measure of participation in the divine life, which they cannot eternally lose; and that the contrary opinion has only been preached as a warning to men prone to degrade themselves and become like the beasts that perish." "He possessed the energy of mind to think out a spiritual theory of the universe in a grossly materialistic age," and regarded "the preference of the material to the spiritual as being at the root of all mischief." Here is a passage of his (not cited by Miss Gardner), which must be read in the light of Spinoza's famous saying about knowing Christ after the flesh and in the spirit: "Nothing else is to be desired except the joy which comes from truth; and nothing else is to be shunned except His absence, the sole cause of eternal sorrow. Take from me Christ, no good will remain to me, and all torments affright me. The loss and absence of Christ is the torment of the whole rational creation; nor do I think there is any other." Such is his much-talked-of pantheism.

One wishes that so original a mind could have had a better teacher than the pseudo-Dionysius, whose works formed his "chief spiritual and intellectual diet." This Greek of the fourth or fifth century was on the right side, but his arguments—as in the startling passage on the non-materiality of Deity—are apt to be chiefly rhetorical: "He is neither soul nor mind. He has neither imagination nor opinion, nor word nor thought. . . . He is not skill, nor is He truth, nor dominion, nor wisdom. . . . He is neither darkness nor light, neither error nor truth"; and so on. More important than John's translation of Dionysius are his own writings, especially 'De Divisione Naturæ,' which was condemned by the Pope in 1225. His treatise against Gottschalk caused a small earthquake. (Maurice, in his 'Mediæval Philosophy,' p. 56-79, has an analysis of this). Prudentius of Troyes found 77 heresies in it, but was distanced by a writer of Lyons who raised the number to 106. Besides this predestinarian controversy, John took part in that concerning the sacraments, but if he wrote a tractate on this subject it has perished. Miss Gardner reasonably thinks that he ought not to have entered into these wordy wars; people could not understand him, and he, as an abstract philosopher, was in a false position when defending one side, even that of comparative rationality, against relative or absolute foolishness.

It is a pity that we know so little personally about this sturdy thinker. He was born in Ireland, probably after 800, and educated there; he went to France about 847, and till 872 lived at the court, esteemed by the King, and doing more or less teaching. His enemies, including Pope Nicholas I., strove to have him displaced, feeling in a general way that he was a dangerous man and liable to give his pupils new ideas, than which nothing could be worse; but the King seems to have stood by him, thereby atoning for many sins. We need not believe too firmly in the joke about sot and Scot and the table between—though on this John's fame in some quarters seems to be largely based; nor in the legend that he went to England when old, and was murdered by his scholars with their pens at Malmesbury. But after his patron's death (in 877) he must have been comparatively friendless and unprotected; he held no benefice or definite post, and his name was a synonym for heresy. A few centuries later he might have been burned with his books. As it was, the evening of his life can hardly have been serene, and nobody, it seems, had sense enough to note his death-date.

His greatness, as Miss Gardner says and shows, lay in this, that he was a spiritualizer as against the materialists and traditionalists of his time, a free-thinker as against the "musty schoolmen" who followed him; a soldier of the Lord and of liberty, standing alone for principles which nobody but himself apprehended, and which it was left for far-distant ages to develop and popularize. As such he claims our respectful remembrance. Here, in a momentous sentence, is the root of the matter: "Authority proceeds from right reason, not reason from authority. Rightful authority seems to me nothing else than truth discovered by the power of reason, and committed to writing." And here is a sufficiently modern sentiment: "Let each one make the most of his own views, until that light shall come which turns into darkness the light of those who deal falsely in wisdom, and turns to light the darkness of those who discern things rightly."

On the Theory and Practice of Art-Enamelling upon Metals. By Henry Cunynghame, M.A., of the Home Department, with illustrations. Westminster: Archibald Constable & Co. 1899. Pp. xvi, 136.

The author of this book is announced on the title-page as being in an employ not exactly identified with artistic manufacture, and one is sorry for this apparent classing of him among outsiders. The book itself reads as if it had been written by one who knew much of the practical side of the art. Whatever the words quoted may signify, they do not seem to point to the position of a master-workman, which is what the preface and introduction and the phrasing of the book itself would lead one to think the writer. The preface contains a plea, all the more touching and serious because of its brevity, for the fast diminishing number of artist workmen who have been accustomed to work for themselves, in their own lodgings, and with some independence of method and design. He thinks that there are many such in Paris even yet, but that in London there are few who work in any way "out of the common." The introduction, thirty-three pages long, contains a very interesting historical sketch of enamelling upon metal, and a rather careful statement of the differences between enamelling in the proper sense and those modern processes which go by the name of enamelling, but with obvious misuse of the term.

If one expects to find uniform accuracy in such a chapter, he will generally be disappointed; and accordingly it is impossible to admit the statement on page 2 that enamelling will not adhere to brass, which indeed is contradicted by a statement on page 10; and yet this contradiction and this error are rather apparent than real, and it appears that the writer was thinking first of one process and then of another when these statements were written down. It is, of course, an error to say that the pointed arch was invented in the twelfth century, for it had been known long before, and was in no sense created by the first Gothic architects. It is also hardly within the author's scope to dwell, as he does, upon the "didactic character of mediæval sacred art," as on page 14; and the discussion on page 23 of the lack of interest for the ordinary mind of classic or pseudo-classic subjects is probably contradicted by historical evidence. The writer evidently understands that splendor of color and beautiful composition in line and in color-masses are what artists in enamelling are seeking; but in his capacity as an English writer for general reading he is unable to maintain that too boldly, and thinks it essential to deal with the "subject" in its literary or its moral and religious aspect. These comments apart, the useful criticism and description contained in this introduction are really surprising in amount and in quality. It is incomplete only in the sense that it is brief, and any person interested in the subject should read this chapter with care, and more than once. It is, however, to be regretted that it is only of European art that our writer treats, and that the two final paragraphs of his introduction, devoted to Japanese and Chinese enamels, are as misleading as possible, both in fact and in critical tone.

The rest of the book is divided into chapters on the choice of a style; on Limoges enamels and their make; on cloisonné enamels, and imitation gems; and on the practical making of the enamel colors themselves. Although the writer says that he hardly expects enamellers to make their own colors, he evidently thinks that they had better do so if they want to be well treated.

The English Income Tax. With Special Reference to Administration and Method of Assessment. By Joseph A. Hill, Ph.D. Published for the American Economic Association by the Macmillan Company, New York. (Economic Studies, Vol. IV., No. 4-5.)

Considering the importance of the English income tax, both as a source of revenue and as an adjustable means of effecting a balance of income and expenditure in the annual budget, one might expect to find comprehensive treatises upon its establishment, administration, and method of assessment, written by English economists familiar with its practical working; but no such treatises have been written, and it has been left for an American to work over the excellent material buried in parliamentary documents, in reports of commissions, and in the annual budget speeches and debates extending over a period of more than half a century. This work is thoroughly well done by Dr. Joseph A. Hill. It may be observed, in passing, that the indifference of English economists itself bears witness to the satisfactory character of the tax and to general efficiency in its administration in that country.

Dr. Hill devotes a brief introductory chapter to an historical account of the tax, and to a consideration of some of the general reasons for its survival as a fiscal resource. A tax on income was levied under Pitt, at the end of the last century (1798), and assumed its present form early in this century (1803). As a war tax, it continued to be levied until the end of the Napoleonic wars, when it was discontinued, to be revived by Sir Robert Peel, in 1842, "partly to provide for a deficit in the budget, and partly to enable him to make certain reductions and reforms in the complicated system of protective import duties." In spite of "complaint on the part of taxpayers and adverse criticism by statesmen, politicians, and writers on finance," and in spite of efforts on the part of the early Chancellors to avoid continuing the tax, it has been renewed from year to year for more than fifty years, the rate being adjusted to current needs; and it is to-day, "although still, in form, a temporary tax, requiring for its continuance an annual renewal by act of Parliament, in all probability as firmly established and as permanent as any part of the revenue system." The tax yielded approximately $90,000,000 in the year 1898-99, and Dr. Hill is led to observe, regarding it, that, "besides constituting an important part of the permanent or ordinary revenues, the tax has repeatedly proved to be a valuable resource for an emergency; through its instrumentality, more than one Chancellor of the Exchequer, under conditions of more or less difficulty, has succeeded in maintaining that close adjustment of revenue to expenditure which the excellent traditions of the English system of finance required of him."

Although the general principle of progression is nowhere recognized, the tax, in its practical working, is, in consequence of certain abatements and exemptions allowed, progressive on all incomes of £700 or less. Incomes of £150 are altogether exempt from taxation. On incomes of from £150 to £400, an abatement of £160 is allowed; and on incomes of £400 to £500, an abatement of £150; £500 to £600, an abatement of £120; £600 to £700, of £70. As a consequence of these abatements and exemptions, a tax of 8d. in the pound is graduated on incomes below £700 by an easy progression from complete exemption on incomes below £150 to an amount equivalent to a tax of 3 1-3 per cent. on the total income, where the income is above £700. The allowance of exemptions and abatements of the tax on small incomes involves a knowledge of the amount of the tax paid by the individual, as well as of the amount of his property or income. Under any system of indirect taxation the amount ultimately paid by the individual cannot be determined or regulated; and consequently no abatement of the tax can be made.

The obscurity attaching to the incidence of all forms of indirect tax, while it facilitates the payment of taxes and avoids friction, has, nevertheless, one unfortunate consequence in that it breeds popular indifference to the action of legislative bodies in voting away public moneys for miscellaneous purposes. The cost to the taxpayer is obscured by indirectness in the assessment of the tax. This tendency to extravagance is one of the chief dangers attaching to indirect forms of taxation. It is fostered in the popular indifference regarding the employment of public revenues. Considering the services performed by his Government, an American pays more out of a given income than he would have to pay were he living under any one of the European governments. He delights in free, extravagant, even wasteful, expenditures; delights to see public works undertaken, wages paid freely for incompetent service, and men employed in great numbers as needless supernumeraries—because all this seems to occur at nobody's expense. An equitable assessment of direct taxes, in a form which should enable each citizen to estimate the cost to him individually of this lavishness, would constitute a wholesome check upon public disbursements. The taxpayer needs to feel that he ultimately earns the wages paid out to idle supernumeraries in the employ of the Government. If the tax could be levied upon him directly in a lump sum which should increase with the extravagance of the Government, the inconvenience of paying it would undoubtedly dissipate his indifference to its amount, and so arouse in him a keen interest in true economy.

In England, taxpayers have always guarded jealously the right of the Government to assess taxes upon them, keeping careful account of amounts granted to the crown, and requiring careful account of their expenditure. English practice and experience are particularly instructive on this point. There is no confusion regarding the sources of public revenues, no confusion of taxpaying with subsidization of industry, no effort to wield the tax-levying power as a means of disbursing political favor, or as a means of keeping wages high. These notions have been outgrown. The English taxpayer regards the payment of a tax as a reduction of his personal income, and looks to receive an account of its expenditure.

It may be observed, however, that, in the assessment and collection of the income tax, as is not uncommonly the case in English experience, the original intent and purpose of the statute has been materially modified in practice, so that the effectiveness of the tax, under the present method of assessing and collecting it, is a consequence of administrative experience and of common usage, rather than of ingenuity on the part of legislators. As it stands on the statute-book, the law is an evidence of the Englishman's ability to think concretely if not clearly, while the successful working of the law is an evidence of his capacity for solving concrete problems practically, if unintelligently. In his study of the subject Dr. Hill has, therefore, wisely not confined his researches to the legislative aspects, but has given due consideration to common practice in assessing and collecting the tax at the present time. In view of the recent effort to establish a tax on incomes in the United States, this study of the English income tax is particularly apropos, whether Congress is likely or not in the future to make other attempts looking to the direct assessment of incomes.

Dictionary of National Biography. Edited by Sidney Lee. Vol. LXIII. Wordsworth-Zuylestein. London: Smith, Elder & Co.; New York: Macmillan. With Indexes to vols. i.-xiv. 1900.

The completion of this noble enterprise offers several grounds for congratulation. One is, that it has been steadily prosecuted for eighteen years, a volume appearing after the first (in 1885) "with unbroken punctuality on every successive quarter-day." Another is, that it has been thus persevered in by the London publishers in the face of a certain and heavy deficit. And a third, that (omitting a supplementary volume or two) the close of the century sees the end of the job. At the outset, Mr. Leslie Stephen alone appeared upon the title-page as editor. With volume xxii. Mr. Sidney Lee's name was joined to his; with volume xxvii. Mr. Lee remained alone and so continued, though Mr. Stephen did not cease to be a most important contributor, and has two significant articles, on Wordsworth and on the poet Young, in the concluding volume. A patriotic disinterestedness has thus been combined with sound physical endurance and with uncommon good luck.

Mr. Lee's Shakspere has been thought worthy of separate publication, and some others of these biographies, nearly as full and elaborate, would merit a like distinction; but it has been less the plan of the Dictionary to make a finished appreciation, literary or historical, than to supply a faithful chronicle of leading facts and incidents in each career. Add to this a scrupulous indication of sources and authorities, which is one of the prime values of the work. Notoriety as well as fame has been a ticket of admission, and even criminals have their place beside saints and heroes. In the volume before us, we pass from Wycliffe, Wordsworth, and Young, from Elihu Yale, to Worth, the Parisian dressmaker, and to the Quakeress, Mrs. Patience Wright, a native of Bordentown, N. J., who was a wax modeller of the last century, and one of Franklin's spies and correspondents in England. The theatrical profession has been carefully looked after from the first, along with artists, inventors, poets, novelists, men of science, warriors, and philanthropists. As the latest discussion of a great many historical personages, the Dictionary is certain to be resorted to for years to come, but its enormous utility consists in snatching from oblivion hundreds if not thousands of untitled persons, honorable middle-class ancestors to unborn generations who will long resort to this record for genealogical origins. Numbers of these had earned the gratitude of mankind, yet had made little noise and must have escaped the ordinary biographical dictionary. Again and again the family is cited as the chief if not the sole source of information. Finally, in the case of writers, the bibliographic details are as convenient as they are precious; and much attention has been given to portraiture.

Another function of the Dictionary is incidental, but it is not small. The writing of brief biographies for such a work is an art for which few are naturally fitted, and which few can learn by apprenticeship. No doubt the editorial control here has been constant and efficient, and the product a joint one. Even so the articles are worthy models of compression. Mr. Stephen, however, may be singled out as exhibiting an ideal capacity as editor and contributor. His articles are extraordinarily compact of information, while relieved of all dulness and enlivened by a pithy humor that has no equal. His characterizations, more or less sparingly indulged in, are likewise masterly and preëminent. Nor does his well-known style suffer from the constraint of space and matter-of-fact narration. Every notice that bears his initials deserves careful study on the part of those who would excel in one of the most difficult branches of literature, usually given over to hacks.

The volume which elicits these remarks is prefaced by a statistical account of this unrivalled Dictionary, whose inception we owe to Mr. George M. Smith, head of the London firm, and whose monument, *aere perennius*, it is. We learn here that the series contains notices of 29,120 men and women, comprehended in almost exactly the same number of pages. A tabular attempt is made on this basis to weigh the comparative worth of the centuries in which the subjects flourished, and there is much other curious matter concerning the most numerous surnames, etc. While Smith is still at the front, and Jones next, but at a considerable distance, and Brown only fifth, Robinson is at the tail end. The contributors have numbered altogether 653, and show not a few of the summits of learning and intellect in the British Isles. The early settlers in America have been looked after by that student, Mr. J. A. Doyle, to whose department we have constantly called attention in noticing the successive volumes. Mr. Goldwin Smith is the only cis-Atlantic contributor mentioned, we think, except Mr. H. Morse Stephens, who, perhaps, ceased to write on coming to this country to reside.

Some Colonial Mansions, and Those Who Have Lived in Them. With genealogies of the various families mentioned. Edited by Thomas Allen Glenn, Member of the Historical, Genealogical, and Colonial Societies of Pennsylvania, etc. Volume I. Philadelphia: Henry T. Coates & Co. 1898. Also, Second Series. 1900.

This work consists of separate essays, some of which are signed by Henry T. Coates, one by Kate Mason Rowland, and one by Samuel Troth, while the greater number are not signed at all. The chief purpose of the editor has evidently been to preserve the records of the ancient families, the Stocktons, the Van Rensselaers, the Carters of Virginia and the Carrolls of Maryland, the Brandons and the Randolphs, the Washingtons and the Jeffersons, the descendants of Mad Anthony Wayne and of the elegant Gen. Schuyler. Twenty-one ancient estates, with their manor-houses and the families which inhabited them, are described and discussed in what seems a trustworthy fashion. Each chapter, moreover, is followed by a genealogy of the family with which it had been concerned; and whether these genealogies are more accurate than the famous English ones of Burke and his congeners is a question which it is better not to raise. As they are much shorter, with no great chance for romancing about crusaders and Irish kings, and as they are the genealogies of the very few notable families among a crowd of nobodies, they may be more trustworthy than the famous combinations of assumption and falsehood which make up the books of European gentlefolk; but it would be unsafe to assert this as a fact. What is attractive about the work is the close identification of the family life in each instance with the house itself in which that life was led. To have given plans of that house would have been, perhaps, to come too near to the family life, and would have been in any event an expensive and troublesome job; for the draftsman who knows how to "measure up" an old house is not the same man as he who carries the camera, and it appears that in America, at least, he is hard to come by.

The architectural value of this work is, however, considerable. Each of the old houses is given in a very satisfying process-print, and usually in more than one, in separate inserted plates; and besides these there are a good many photographs of interiors and exteriors, reproduced in half-tone and printed with the text. Family portraits, of course, are reproduced in considerable numbers, and there are also cuts of arms in sketchy but apparently accurate drawing. Thus, to take an important instance, the Carters of Virginia, to whom a double essay, or one divided into two parts, is devoted, have, by way of illustration, nineteen photographic views of their buildings, and the same number of family portraits, not counting heraldic achievements; and some of the views of the old mansions are really of surprising interest, and more valuable hints for the architects of our day who are trying many a book which architectural subjects. There houses more attractive in their external aspect or more important than any of these, and one of them is certainly the great mansion of Doughoregan Manor, which was the seat of Charles Carroll and his successors, the family which gave by their social and religious influence so remarkable and special a character to the colony of Maryland.

The character of the first series is well kept up in the second, with, perhaps, the additional attractiveness of providing a somewhat larger scale for the illustrations. None of the houses given in the second series are quite as important as one or two of the first lot, but they are equally instructive to the student of our earliest architecture—that of the "Georgian period."

A Study of the Greek Pæan. By Arthur Fairbanks, Ph.D. [Cornell University Studies.] Macmillan.

Dr. Fairbanks's thesis is an interesting and thorough investigation of the origin and development of the pæan—a word used with a range almost as wide as the word hymn, and more specifically to designate a hymn to Apollo, and also as an epithet of Apollo and less commonly of other deities. In English usage we constantly apply the term to a hymn of victory, and we associate this meaning with it almost exclusively. Was it primarily a song of thanksgiving, as some distinguished German scholars have maintained, or a song peculiar to the worship of Apollo and Artemis; or are these uses secondary and derivative, or transferred from an earlier and restricted application to a special god whose function was later merged in the powers of greater deities of the pantheon? Dr. Fairbanks's answer to this question has, on the whole, the merit of consistency and a satisfactory logical development. He assumes the existence of an old deity, Pæan (Παιάν), who in Homer is the physician of the Olympic deities, and the patron of human physicians, a minor god of healing. In Hesiod, this deity is expressly distinguished from Apollo, and his individuality seems clearly attested in passages of Solon, of Aeschylus, and of Pindar. Later he seems to vanish into a shadow of Apollo, or to become merged and identified with Asclepios. His ghost faintly reappears from time to time in inscriptions or epithets or ceremonial usage. We can hardly doubt his existence as a local deity anterior perhaps to Apollo.

But it may be plausibly suggested that this deity is simply a name born of the refrain used in the worship of Apollo. Such a whimsical genesis we are quite certain has taken place in several cases, notably and assuredly in the following. There is no question that the youth Linos, who was lamented in the Linos song, got his name and his existence from the Semitic refrain *ai lenu* (woe to us!), which the Greeks borrowed in their refrain αἴλινον. Adonais is manufactured somewhat similarly from the foreign refrain *Adon ai*; and many epithets of Bacchus and other deities arise simply from the cri with which they were invoked in prayer an worship. Hence the god Pæan might be simply an echo of the cry pæan; and the hym may be anterior to the god.

There are very good reasons, however, believing the reverse. He appears in Ho as an independent being, and he never totally disappears from the pantheon. "The pæan is a healing song because it is addressed to the god of healing." If we grant this, it must be admitted that the other meaning and uses of the pæan flow very smoothly and consistently; if we start with the assumption made by Schwalbe and others, that it was originally a song of praise and thanksgiving to Apollo, our course is jolting and up hill. The pæan was chanted before battle, it was sung after a victory, it was used with sacrifices before important undertakings, it was used in the ordinary worship of Apollo (or, later, of any other deity), it was sung with a libation at the banquet or symposium, it was sung at marriages. How are we going to reconcile these diverse uses; how, especially, with the supposition that it was primarily a thanksgiving? In the opening of the "Oedipus Tyrannus," we are told that "the pæan rises loud, mingled with groans of distress." Such a passage is very awkward if the pæan is necessarily a thanksgiving. The key to the various meanings is really quite simple if we take the unanimous definition of the scholiasts, the "pæan is a hymn sung for relief from plague or evil," and, hence, assume that it is primarily a prayer for freedom from illness or distress, addressed to the Healer. This is exactly the situation in the "Oedipus," where the people are praying for deliverance from the visitation of the plague. With a wider application, it is used to avert any future or imminent peril. When *Iphigenia* is trying to escape with her brother, and their ship is suddenly driven back by wind and tide towards the inhospitable coast of the Taurians, she chants a prayer for help to Artemis, and at the same time a pæan is responsively sung by the sailors.

In like manner, we find the pæan, as a rule, joined with the sacrifices that preceded any important undertaking: for example, when the Athenian fleets weighed anchor for the Sicilian expedition, it forms one of the features of the striking scene described by Thucydides, and one of the elements of contrast in his artistic picture of the ruin that followed. Naturally, therefore, it was chanted before joining battle; on such occasions, it is always preceded by a libation and by sacrifices, and followed by the battle-cry as the soldiers rush to the attack. The symposium can hardly be reckoned an "important undertaking"; but it was an occasion on which libation was offered and the presence of the gods was recognized. The pæan which *Iphigenia* was represented, with pathetic contrast, as having sung, with "fresh, virginal voice at her father's table," was only an extension of the original use of the hymn. At a very early date it became associated with the worship of Apollo. Nothing could be more natural, as Apollo was preëminently ἀλεξίκακος, the averter of evil. It was easily transferred later to his son Asklepios; the pæan of Isyllos, found at Epidaurus, is addressed equally to Apollo and to Asklepios, the god of healing. Next the scope of the hymn is widened to include other deities; at the banquet, it is often addressed to Zeus, the Saviour. The marriage feast is simply a variety of the symposium. The pæan of victory is an altar-hymn, or a processional accompanying the festal sacrifice by which a triumph was celebrated. Dr. Fairbanks is very particular in maintaining that this was an expression of joy and never a thanksgiving. But if it was primarily addressed to a certain Pæan as a petition for deliverance from ill, what prevents its being converted into a thanksgiving to the same deity for salvation actually bestowed? It would, on the contrary, be strange if the divine Physician never received his fee of incense and gratitude.

The Week.

The Republican platform adopted at Saratoga on September 5 is a formidable document. It is nearly as long as the Governor's annual message to the Legislature, and it deals with as many subjects. It is apologetic in tone, and is lamentably lacking in directness of thought and expression. In a literary point of view it is a failure. As a definition of political principles, it betrays the vagueness of men who are doubtful whether they have any. Their uncertainty is at once disclosed in the treatment of Imperialism. They first deny that there is any such sentiment in the United States, but say that, if there is any, it exists among the Democrats, because they deprive the negro of the ballot in the South. They say that the policy of the Republican party concedes to the inhabitants of the Philippine Islands every measure of self-government consistent with the maintenance of American sovereignty. As there is no standard by which this concession to the Filipinos may be tested, this is saying that we give them as much self-government as is good for them, which is just what Spain said in respect to both Filipinos and Cubans.

There are only two or three topics of State policy in which the public just now take any interest. One of these is the Franchise Tax Law. This was the most meritorious act of the Roosevelt Administration. It was also the one which made Roosevelt's renomination as Governor impossible, in the eyes of the Republican machine politicians, because it prevented them from getting their usual supplies of cash. It was supposed until the last day that the Platform Committee would leave out the Franchise Tax entirely, but, when the delegates came together, it was found that public sentiment throughout the State was too strong to be ignored. There was a danger that if the subject were wholly omitted, some delegate would offer an independent resolution which might be dangerously strong, both in its terms and in its popularity in the Convention. So an insipid resolution was adopted at the last moment which declares that "the taxation of corporations enjoying the use of public property will continue to be, as it has been in the past, a policy of the Republican party." Everybody knows that the party, *i. e.*, the Platt machine, was bitterly opposed to the Franchise Tax Law, and supposed that it had killed it, and would have done so had not Gov. Roosevelt made it the subject of a message of urgency to the General Assembly just before the adjournment of the session of 1899. According to the newspapers, Mr. Platt's son was at Saratoga opposing any reference to the Franchise Tax in the platform.

Gov. Roosevelt let us into a precious secret last week by telling us how much he was indebted to Mr. Odell for help in securing useful legislation during his own term of office. Upon this subject he said:

> "First, as to our candidate for Governor. During my two years of service, Mr. Odell has been not merely my close and stanch friend, but my trusted helper and adviser in every crisis."

This puts Mr. Odell in an entirely new light. There have been three legislative crises, and three only, in Gov. Roosevelt's Administration. One of these was the passage of the Civil-Service Law which repealed Gov. Black's anti-starch bill. Another was the passage of the Franchise-Tax Law. A third was the struggle at Albany over the Ramapo bills proposed by the Merchants' Association. If Mr. Odell was the trusted helper and adviser of the Governor in these crises, the public have been greatly misinformed. Mr. Odell's services in behalf of civil-service reform have never been suspected before, and we think that Gov. Roosevelt owes it to the public, as well as to Mr. Odell himself, to give us a more particular account of them. His aid in securing the passage of the Franchise-Tax Bill has been equally concealed from the public eye. At the time when this bill was pending there were public hearings, both in the Legislature and before the Governor, in which men of prominence figured from day to day, but the name of Mr. Odell was not among them. The services of this trusted helper and adviser were strictly private. Here the Governor has the advantage over his critics, for he knows exactly how far he relied on Mr. Odell in this matter, and nobody can dispute him. We observe that he does not give us any particulars here, although he does tell us how Mr. Odell helped him in promoting the Ramapo legislation.

As to Ramapo, the Merchants' Association prepared two bills which were taken to Albany by its representatives with an urgent petition for their passage. One was a bill to repeal the charter of the Ramapo Company or to take away its extraordinary powers for condemning water-sheds—powers which ought never to have been committed to a private corporation. Another was to confer upon the city of New York similar powers of condemnation to those conferred on the Ramapo Company. Neither of these bills passed. The Merchants' Association found the words "No Thoroughfare" posted at the head of every road they attempted to follow, showing that the Ramapo Company was stronger at Albany than any force opposed to it. The conduct of the Governor himself was very puzzling to the Merchants' Association. They did not get the help which they expected from him. It turns out now that the Governor was consulting with Odell on the Ramapo question, and that Odell was his "trusted helper and adviser" in this matter, if in no other. And what was Odell's contribution to the assembled wisdom? A bill was passed which required the written approval of the City Comptroller to any contract between the city and a private company for additional water supplies. To this bill was added the following paragraph:

> "All proceedings relating to the making or approval of any such contract may be reviewed by the Appellate Division of the Supreme Court, in the First or Second Department, on the application of any resident taxpayer."

This the Governor declares to be "the vital provision of the bill," and for this he says we are indebted to Mr. Odell. He thus enables us to estimate the value of Odell's services as an adviser in every crisis. What is implied by the power of the Supreme Court to review all proceedings relating to the making or approval of any such contract? Evidently it means the power to pass upon the regularity of the proceedings, not upon the expediency of the contract. If the proceedings have been regular, the court has nothing more to say. For this boon we are indebted to Odell. But we are indebted to Roosevelt for the information that he was consulting with Odell on this subject.

The returns from the Vermont election of September 7 show that the Republican vote this year varies but slightly from 48,000, while the Democratic is about 17,000, and the Republican plurality not far from 31,000. In other words, the Republican vote is almost the same as in the Septembers of 1880 and 1888, when the party, a few weeks later, carried the nation, while the Democratic is more than 2,000 short of what had been recorded in the three contests before 1896. On the other hand, the Democratic vote is considerably larger than it was four years ago. Apparently about half of the recalcitrant Democrats of 1896 now accept Bryanism, while the other half refuse to vote at all so long as the party clings to it, instead of supporting the Republican ticket, as they did four years ago. The moral is that the Republicans may carry the country for McKinley in November by hard work, but they cannot repeat the "scare" of 1896 and frighten a host of Democrats into supporting their candidate. Bryanism is still so odious that the more independent-minded men who also oppose McKinleyism are content to let the Republicans beat it once more, though they do not expect or desire that the Administration shall be endorsed by any such phenomenal Republican majorities as were rolled up four years ago.

The result of the Maine election justifies the indications of the canvass. That developed nothing like the interest or enthusiasm on the Republican side which existed four years ago, and it was correspondingly hard to get voters to the polls. On the other hand, while the Democratic machine was in much better running order than four years ago, and lists could be printed of prominent Democrats who had returned to the fold, it was clear enough before election day that a large number of life-long Democrats would not support the party so long as Bryanism stands for Democracy. The real moral of the result in Maine, as in Vermont, therefore, appears to be that whether the financial question be the "immediate" one, as McKinley puts it, or Imperialism the "paramount" one, as his rival claims, the real issue with the masses of voters is what all recognize as Bryanism. While that stands for Democracy, many partisans who believed in the principles of Tilden and Cleveland will stay away from the polls, while most Republicans, however much they dissent from McKinleyism, are ready to accept it as the only way in which they can escape what they detest still more. Enough returns have been received to show that the total votes cast on Monday last will not vary materially from 75,500 Republican and 42,000 Democratic. This would be a Republican plurality of 33,500, as against 48,377 in 1896, 12,522 in 1892, 18,048 in 1888, and 19,851 in 1884.

The charges of fraud in the Arkansas election of Monday week take a pretty definite form. The election machinery which was originally contrived for handling the negro vote has been operated this year, as in other years, against the white Republicans. Goebel is said to have taken the central idea of his Election Law for Kentucky from the Arkansas statute, omitting, however, some of the more drastic provisions of the latter law. There are seventy-five counties in the State, and the law provides that there shall be a board of three Election Commissioners appointed for each county by a State board composed of the Governor, Secretary of State, and Attorney-General. These officers are always Democrats, and have run as candidates to succeed themselves, while having sole power of appointing the county boards of election judges. This year the Attorney-General was the Democratic candidate for Governor. The charges brought this year against the State board have been much the same as those which were made by Republicans in 1896. The law provides for one Republican member on each county board, but he is commonly regarded by the two Democratic members as a figurehead. In many of the precincts the county boards have ignored requests and nominations of Republicans in appointing judges of elections, and have appointed in their stead as Republican judges negroes unable to read or write. In other precincts no Republican has been found competent, in the minds of the Democratic members, to serve, and the precinct board has been made up entirely of Democrats. These conditions render a comparison of the election returns of this year with 1896 of little significance. The Republicans, however, with the same candidate in the field as in 1896, and a weaker man to oppose in the Democratic nominee, seem to have made distinct gains, especially in those white counties where they were able to secure a fair count.

Not the least among the ulterior results of the destructive Texas storm are those which bear on the cotton industry. The flood which not only wrecked most of the Galveston storehouses, but practically laid waste a good part of the farms of southern Texas, came at a most inopportune moment for the trade. The Manchester spinners had just made their agreement to hold off from buying until the new American cotton crop should be moving in quantity to market. The movement has begun later this summer than in many years. Last month's receipts of cotton at Galveston from the interior farms were less than one-fifth the receipts of August, 1899. The same conditions prevailing at nearly all other American ports, and warehouse supplies of cotton, here and abroad, having fallen to abnormally low figures, a very unusual opportunity was presented for speculators to engage in forestalling operations. This movement, checked by the decision of the English spinners, received most unexpected aid in the news from Texas. That State produces ordinarily more than one-fourth of the entire American cotton crop, and the new crop of the region was at its most critical stage when the storm of Saturday swept over it. There were 7,600 bales of cotton in the Galveston warehouses at last week's close, and 5,000 bales on shipboard in the harbor. Considering that the arrival of Texas cotton in market had been reckoned upon as the first means of breaking the speculative deadlock, the dismay into which the cotton-consuming community has been thrown by the Galveston news is not hard to understand. The best to be hoped for is that the area of damage to the crop will turn out to be less extensive than early estimates have indicated. Meantime we are glad to learn that New York cotton-market interests are taking ground against further operations in the direction of cornering the American supply.

Every impartial reader must have been struck by the dignity and good temper of the statement sent out by the Executive Board of the United Mine Workers on Saturday. Not only was there an entire absence of passionate and threatening language, but this Executive Board declined to heed the petition of the anthracite miners in Pennsylvania who desired to strike at once. They postponed final action in order that the employers might have further opportunity to avert the strike, and in order to avoid the enormous loss and confusion which must fall upon the industries of the Atlantic seaboard States from an interruption of the coal supply. The principal grievance of the miners is that of insufficient pay for their work. "Wages of miners," says the Executive Board, "have not kept pace with the cost of living, and in some instances have been reduced; they have been required to deal in company stores and accept the services of the company's doctor; they have been required to accept wages based upon an antiquated sliding scale that invariably slides downward; they have had their wages reduced by an arbitrary and exorbitant system of dockage; they have been compelled to wait for their pay weeks after the time specified by law." All these grievances are susceptible of proof or disproof; and while it is not possible for even the most liberal and fair-minded employer to raise wages by his mere volition, it may sometimes be necessary for him to show to the satisfaction of the public why he cannot do so. When a great calamity is impending which involves the wellbeing of the whole community, every person who is concerned in producing it is put upon the defensive. All are bound to show that they have justice on their side, or at all events that they are powerless to avert the threatened danger. These considerations point to the need of some arbitration of the questions in dispute which shall satisfy the public mind. The Mine Workers' committee say that they have sought arbitration and that it has been refused.

The investigation by the Police Commissioners into the charges of brutality on the part of the police towards negroes during the recent race troubles on the West Side began on Friday, and was conducted in exactly the way that was to have been expected. The Tammany chairman who conducted the proceedings was arbitrary and overbearing in his attitude towards the colored man who was clubbed and kicked in a station-house; and the Tammany Chief of Police did his best to intimidate subordinates who might have testified to the facts. Altogether the performance was transformed from its nominal purpose to fix the responsibility for a shameful breach of duty, into a hardly concealed attempt to whitewash the New York Police Department, and hold up to ridicule anybody presumptuous enough to question its immaculate purity. Such a performance ought to shock and surprise the city, but the people are too much accustomed to this sort of thing at the hands of Tammany to get excited over it.

Washington dispatches indicate that the Administration is now inclining towards the policy of withdrawing from Pekin, let the other Powers go or stay. This is a veering of the weather-cock towards the right quarter. When the Russian note stated that "the purpose for which the various Governments have coöperated for the relief of the legations in Pekin *has been accomplished*," and that the next thing to do was to recall the troops, our Government replied effusively that it was in "accord" with "the frank declarations of Russia." It did, indeed, add something about "a general withdrawal" being desirable, and said that "we shall give instructions to the commander of the American forces in China to withdraw our troops," unless there developed "a general expression of the Powers in favor of continued occupation." This left us comfortably pointing north by south, and the needle has since swung between "No scuttle!" and "America stands alone!" We do not know what influences now move the President to press on evacuation. Be they partisan or patriotic, however, they are urging him in the direction of sound policy. Every day that we stay will make departure the harder and more improbable. It is said we must remain in Pekin to provide against remote contingencies. But in such matters, as Sir George Lewis said of the English occupation of Egypt, "Cure is better than prevention." As he warned English statesmen then, so may we now say to American, "By providing in advance against all possible evils, you saddle yourselves with unnecessary and crushing responsibilities, instead of leaving yourselves a free hand to meet each evil as it arises."

Criticism of the Kaiser is risky enough, and the German press reviews his sermons and orations under the shadow of a very palpable penalty for *Majestätsbeleidigung*. Under such circumstances, it is interesting to note how generally the more independent German editors have expressed disapproval of their sovereign as a homilist, and how insistently they have urged upon him the grace of silence. No subtler criticism of the Emperor as orator has appeared than that of the Liberal leader, Dr. Theodor Barth, in *Die Nation*. In view of the Kaiser's continued activity as an orator, the nation, says Dr. Barth, must assume a definite attitude towards its sovereign in that capacity. The doctrine of royal infallibility, he asserts, is defensible only through the interposition between monarch and people of a responsible Ministry, freely open to criticism. Any expression of opinion made otherwise than through the Ministry or without its prior consent is, on the Kaiser's part, extra-imperial, and merely personal. To such "heart-to-heart talks" the nation must, out of courtesy, lend a respectful and sympathetic hearing, with the reservation, however, of all rights of criticism and of dissent. In a word, Dr. Barth feels that the Kaiser, in his various speeches and sermons, puts off his awful and inviolable majesty, and becomes simply the frank and outspoken friend of the people. The analogy with the doctrine of papal infallibility is obvious. Leo XII. *qua* Pope can do no wrong, though as plain Signor Pecci he is liable to error, like the rest of us. Wilhelm II., with his Hohenzollern notions of the divine right of kings, will hardly relish this doctrine. It is to be hoped, however, that Dr. Barth's very amiable theory may not constitute cause for a prosecution for *lèse-majesté*.

Belgium had the best will in the world to get into the Chinese imbroglio; and with good right enough, for she had large commercial interests at stake, and, like the other Powers, a Minister in peril. It was natural, therefore, that she should set about raising a volunteer legion for service in China. The recruiting of this legion was complete, and the volunteers' last farewells to some thousands of Flemish maidens were in progress, when a diplomatic note from the German Minister for Foreign Affairs dashed all Belgian hopes of treading the path of glory in China. Herr von Bülow pointed out that the Powers really stood in no need of Belgian reinforcements, implying that Germany would do the Attila business handsomely herself, and that little neutralized Powers like Belgium had better keep out of the mess entirely. The Belgian Government broke the news somewhat tardily to the volunteers, which was most impolitic; for emotions keyed up to red war now find vent against an Administration which lacked the grace to let its heroes down easily, and the Ministry must answer the volunteers in Parliament. It is undoubtedly a sentimental hardship that a nation eager to bear the white man's burden should be snubbed in its dearest aspirations, but as the concert of the Powers more and more jangles out of tune, the feeling may grow among the concerted Powers, even, that Belgium is well out of it all.

The Boers go on showing a most inconsiderate disregard of Mr. Chamberlain's electoral plans. If they would only lay down their arms and promise to be good, he would have Parliament dissolved and a general election under way in a trice. But the art of graceful surrender seems to have died out of the world. Capital after capital of Boer, Filipino, and Chinaman has been taken, yet the obstinate beggars pay no attention to the rules of war or to the wishes of their conquerors. This is really an unneighborly course. How can you live at peace with people who keep on fighting after you have them thoroughly whipped? Especially how can elections be carried in a blaze of military glory if the "pacified" Philippines will insist upon fresh insurrections, and if the Transvaal burghers, beaten in one city, flee to another? There will have to be new rules of international law to the effect that when a victorious general asks his opponent to surrender unconditionally, so that the "party" may be helped to carry an election, the request may be refused only on peril of outlawry. In Canada, Sir Wilfrid Laurier has to wait only to see if the crops are good before he dissolves and goes to the country. This, however, is simplicity itself compared with the labor of appealing to the electors on the strength of complete victory in South Africa or the Philippines, and then having that victory all the while flitting like a will-o'-the-wisp to the next mountain or morass.

The latest budget of "King Dick" (not an American boss, but the Hon. Richard Seddon, Prime Minister of New Zealand) shows a surplus of $2,500,000, the total receipts being estimated at $38,000,000. His exposition of the financial status of his commonwealth of less than a million souls shows that its practice of state socialism for the past seven years has neither ruined the country, as some predicted it would, nor yet brought on the millennium prematurely. Mr. Seddon himself does not now predict so many and such sweeping benefits from the programme of "practical socialism" as he did in 1893. If the laws for the protection of labor and the regulation of wages and the prevention of strikes have not frightened capital away from New Zealand nor killed industry, they have not, on the other hand, extinguished discontent among the working classes, or essentially changed human nature. Like most legislative panaceas, socialism by statute in New Zealand is found, after a period of years, to leave things very much as they were. It is always to be remembered, too, that experiments in a new state, with a scanty population and vast reserves of land, do not necessarily prove anything for older countries. One of the best fruits of New Zealand institutions is Prime Minister Seddon himself—a man who, from the lowliest origins, has risen by sheer force of ability to the head of the state—"King Dick," as he is affectionately called.

MR. M'KINLEY ON THE DEFENSIVE.

The President, in his letter of acceptance, shows that he, too, considers Imperialism "the paramount issue of the campaign." Gov. Roosevelt contemptuously dismisses it as a bogey with which to frighten children; President McKinley devotes to it three-quarters of his long and labored letter. He is too shrewd a politician to write six and a half columns about an issue if it were really, as his leading supporters have gone up and down the land asserting, non-existent. Here, then, is one result of Bryan's bold and eloquent speech at Indianapolis. It has stung McKinley into a reply—that is, it has drawn him out of his intrenchments to give battle on the ground where his opponent prefers to fight. Whatever strategic advantage lies with the candidate who makes and forces the great issue, is tacitly accorded by the President in this campaign to his antagonist. Mr. McKinley begins his fight with an apologia which will dismay his most ardent followers by its enormous length.

Singling out only a few of the points in it which challenge comment, we must begin by sweeping away all that the President says about "duty." That word, in Mr. McKinley's mouth, all the world now knows to mean one of two things. He sometimes uses it of the thing he would like to do, provided it hurt nobody's feelings; sometimes of the thing he was compelled against his will to do. He gives us a handy glossary of his usage of the word in this very letter. His instructions to the Paris Commissioners were, he says, to the effect that our national "moral obligation" was, in settling the terms of peace with Spain, to avoid all "ambition of conquest." There was "duty." But how did the Commissioners understand it? One of them, Senator Frye, in a public speech in Philadelphia on March 18 last, said that he went to Paris determined on "taking all we could get." He added that when the Commissioners telegraphed to the President their ultimatum to the Spanish members, "he cabled back a reply that it was eminently satisfactory to him." It is a great help to the correct understanding of McKinleyese to have it thus certified that, in the President's vocabulary, "duty" means "taking all we could get."

Mr. McKinley affects an air of great frankness in citing from some official documents not hitherto published. He is going to "show to my countrymen what has been and is being done" in the Philippines. To this end he quotes from his instructions to the Peace Commissioners. When the Senate asked for these instructions, they were refused, on the ground that it would be "incompatible with the public interest" to make them public. Now, in party interest, they are unveiled—but in what form? Evidently in a garbled form. The marks of hiatus and omission are upon the face of the printed version. Why did not the President, professing to make a clean breast of it with his admiring and confiding fellow-countrymen, tell the whole story? Was it because his first instructions were not to take the Philippines? It has been openly asserted, and never authoritatively denied, that such was the tenor of his original policy. The mutilated document which Mr. McKinley now gives out looks very much as if this were entirely true; as if the President were as sure in August, 1898, that "plain duty" required us to get out of the Philippines, as he was in December, 1899, that it commanded us to give Porto Rico free trade; and as if powerful commercial interests turned him about in one case, as in the other.

At any rate, the President's publication of such parts of the secret archives as suit his partisan purposes, serves to remind us once more of the studied care with which full knowledge has been kept from the people. The Administration has all the cards up its sleeve, and plays only those that it chooses. Just think of it—the foreign correspondence of 1897 and 1898 has not yet been published! The country is in the throes of an election over the results of the war with Spain, and has not yet been permitted to read the diplomatic notes which preceded it! Some extracts were published in Madrid, and they were enough to make Americans hang their heads at the incredible duplicity or unequalled weakness which was revealed in our Government. But the whole story has not yet been set forth. Why not? Why did not the President publish his instructions to the Paris Commissioners in full? His suppressions invite the worst interpretations. They certainly show that his pretence of taking the people into his confidence is hollow. Bent on giving the Filipinos only so much liberty as he thinks is good for them, he is apparently determined to give Americans only so much information as he thinks will be good for them—and for him.

A large part of Mr. McKinley's defence is an iteration of twice-told tales. Into these we cannot follow him in bestowing his tediousness upon the reader. Some of his new ingenuities of misstatement about the Philippines we shall have to leave for later exposure. But what a lamentable showing the whole story is, he himself being witness! What Mr. Olney has bitingly called Mr. McKinley's "stupid and tactless" policy in the Philippines, forces itself through all his smooth and plausible words. A war of humanity turned into cruelties greater than those against which we took up arms; blunder upon blunder; a long record of hope deferred and prophecies unfulfilled; the American name made a hissing where it had been the symbol of hope; even Spain jeering at us for mistakes huger than her own; the Republican party compelled to writhe under the whip of Republican professions and watchwords of other days now applied to its own back—this is really the great ugly fact that Mr. McKinley tries to cover up with a deluge of words. Has he not, by his renewed assertion that Destiny is responsible for all this pitiable record, this indelible shame, taken his rank with those "modern prophets" described by Meredith, "who summon Destiny to strike without a preparation of her weapons or a warning to the victim"?

THE THIRD-PARTY PROTEST.

The gentlemen who put a third Presidential ticket in nomination in this city on September 5, were under no illusions concerning the immediate practical result of their action. They leave to politicians the mouthing of great claims. It is not numbers but a principle for which they stand. Be the votes many or few, there is their profession of political faith, there is the cause to which, whatever others may do, they give hand, heart, and suffrage. Nor, on the other hand, are they afraid to be few. They are not of those who are "ever strong upon the stronger side." All purely moral movements begin with Isaiah's "remnant," and whereunto they may grow their first promoters do not stop to inquire. In the face of enormous numerical odds they are as light of heart as the Welshman, David Gam, who, when asked by King Henry at Agincourt how many French there were in the field, stoutly answered, "Enow to be killed, enow to be made prisoners, and enow to run away!"

If there seems to be more morals than politics in this third-party movement, so much the worse for politics. The Philistines of either party will jeer at a handful of college professors who resolutely say they will have neither part nor lot in the mixture of issues, good and bad, and the repellent personalities put forward by Democrats and Republicans; but don't they wish they might enlist such earnestness and enthusiasm? The very sneer is a confession of the base condition into which the two great parties have brought American politics this year. If the party managers could point, as they have been able to in other days, to the best minds and finest moral zeal of the land arrayed with them in a noble passion for political reform, they would not be so distressed at the sight of a small band of intellectual men parting company with them. They know in their hearts that the few stand for many; that the expressed disgust of the manœuvrings and trickery of the two great parties is representative of a vastly greater unuttered disgust; that the competition in evil which has come to mark partisan politics has created widespread and profound dissatisfaction. A flood of unsolicited letters which have come to us from some of the bravest and best of the land, have witnessed to the extent and depth of the feeling among honest men in both parties that they have been betrayed by politicians, who would deliberately shut them up to a choice of evils.

It is as a way of escape for the righteously discontented that the third ticket has a good part of its serviceableness. Here is a *tertium quid*, here is an articulate moral protest, a welcome alternative to that entire abstention from voting which would otherwise have been the only refuge for many who refuse to be taken in the snare of either McKinley or Bryan. It is something to have given such men an opportunity to exercise the freeman's right. It is an achievement to have offered a positive good as a substitute for the politician's choice of evils. If the bosses have their way, voting will soon be reduced to a smelling-match to see which egg offered to voters is the least addled. A great many citizens would like political food good in itself, not simply by comparison.

It may be said that the platform of principles adopted by the third-party movement is not so precise and trenchant as it should have been. To this it might well be replied, in the words of the Parliamentary orator who was called to order, "The Speaker failed to appreciate the force and the energy, the justifiable force and energy, of the language which I kept back." Only general principles, only condensed assertions of policy, could advantageously be adopted. The principles are perfectly sound, and include precisely the ones in demand by those who rebel at the hopeless assembling of contradictories in the two party platforms. The recovery and reaffirmation of a republican form of government; the gold standard and a sound banking system; civil-service reform and the abolition of all class legislation—right worthy ends are all these. Out of the jumble of party deliverances, the platform of the new National party seizes all that is good and rejects all that is bad. If to assert such a political profession of faith is to injure either Democrat or Republican, whose fault is it but their own?

And we must not fail to notice one great difference between this latest platform and those which have preceded it. In Senator Caffery we have a man whose character is a guarantee that the thing which he says, that he will perform. He has sacrificed his political career to his convictions. Against his party, against his State, he has stood firm for what he believed to be right. Such a man would not treat a party platform as a juggler's hat, out of which, in the manner of McKinley, to draw all sorts of surprises. He would not go about the country making declarations which would leave his hearers in doubt, as Bryan does, if his passion for liberty were not simulated, or unconsciously histrionic. What we have long needed is character in the candidate to match and assure the promises of the platform. No one can deny that we have such a happy combination in Mr. Caffery and the declaration of principles upon which he is nominated for the Presidency.

Considering the movement, then, in the light of a moral protest, in which clear-eyed and strong-hearted men may join with cheerful assurance of that practical defeat which has so often meant ideal victory, we cannot but commend it. It is a sign that the political conscience is not seared. For the present a protest merely, it may in the future prove a great hope. That we must leave to the future, certain only that it is always right and wise to assert the truth and do the duty which lie next to hand in the present. And of the ultimate triumph of liberty over those who would subvert it, either at home or in distant islands, we can have no more doubt than Emerson, who, aristocrat by intellect and democrat by sympathy and conviction that he was, recorded his belief that

> "He that worketh high and wise,
> Nor pauses in his plan,
> Will take the sun out of the skies
> Ere freedom out of man."

PLATT AND ROOSEVELT NOW.

Brushing aside all minor and unimportant features of the Republican State Convention, its main outstanding result is the triumph of the Platt idea over the Roosevelt idea in the Republican politics of New York. The boss, in other words, has completely extinguished the influence of the reforming Rough Rider. All those quasi-promises made at Philadelphia to Roosevelt's friends that his successor in the Governorship should be a man after his own heart, are now shown to be the dicer's oaths that the discerning perceived them to be at the time. What blunt and honest men will now say all over the State, in view of the dénouement of the farce which Platt has kept on the stage for three months, is simply this: "Well, it was true, then. Platt had determined to get rid of Roosevelt. He wished a Governor whom he could say that he owned, body and breeches. Such a man he has now nominated."

We do not blame Platt for scheming to make himself supreme. He is simply acting after his kind. It is of the nature of a tyrant to brook no dissent or opposition. Not every arbitrary ruler, however, has Platt's astuteness and patience in waiting for the hour to strike to free him from an insubordinate servant. If it is genius to do the best possible with the material in hand, then Platt is a boss of genius. He put up with Roosevelt's eccentricities of reform with infinite long-suffering. The reason was that he could afford to smile grimly and wait. Roosevelt was placing his popularity at the service of the machine, and it was only a question of time when the machine would be strong enough to crush him. If Platt has had any one guiding thought during the past year, it has been to stamp out Roosevelt and all his works. He could explain his conduct as Victor Hugo explained his votes in the French Chamber: "I am guided by this little gentleman in spectacles facing you. As we are invariably of a different opinion, I remain seated if he gets up, and when he remains seated, I get up on trust." Steadily opposed to all that Roosevelt and his friends stood for in the Republican party, Platt has steadily worked to compass their undoing. That is now assured. The last taint of independence and reform is removed from the Republican party in New York. "The party? 'Tis myself," says Platt openly.

To show what a terrible flouting the reforming Republicans have received at Platt's hands, it is necessary to take only their own account of the case. Roosevelt himself said last May that his good work in this State was but begun. He needed another term as Governor to advance it. Therefore, it was his "duty" to refuse the Vice-Presidential nomination. But he had made party fealty a higher obligation than mere duty, and Platt cleverly manipulated things so that the Governor had to take the nomination which he had sworn he would not, or else incur the (to him) frightful odium of not being obedient to party. But even after that first successful trick was played on Roosevelt, he and his friends continued to talk about the bright outlook for a continuance of reform Republican politics in this State. Gen. Greene or President Low would succeed Roosevelt at Albany. At any rate, a "man of his type" would lead the party. Roosevelt's newspaper organs were sure of this. They entered upon that comic phase, so regularly to be observed in them six weeks before the Convention, of reasoning with Platt, expostulating with him, even solemnly warning him of the danger of defeat if he nominated a machine Governor. But the boss let all these legions thunder by, and went on quietly maturing his own plans. What he was all along aiming at and working for is now revealed to all the world, and is, as we have said, a Republican party boss-owned and boss-ridden, with every snivelling reformer cast into the outer darkness.

The incredible thing, however, remains to be told. Roosevelt not only is dragged at Platt's chariot wheels, but professes to like that position in the boss's triumphal procession. He has the effrontery, for we can call it no less, to ascribe Odell's nomination to the "irresistible" demand of Republican voters.

In an ordinary politician, standing for office, we might excuse this—might pass it by as one of the recognized modes of "supporting your party" by inventing fictions in its behalf which impose upon nobody. But Gov. Roosevelt is an educated man, professing to be bound by the highest standards of truth and honor. As such, it is his duty to see the thing as it is, and to declare what he sees. And he must know, as everybody knows, that his "irresistible demand" for Odell is a gross exaggeration. If he means the demand of the "organization," it is true. If he means the demand of the citizens upon whom the party relies for its majority in the coming election, it is not true. Mr. Odell has, indeed, the qualities that go to the making of a party boss of the prevailing type. He is the man who would naturally step into Platt's shoes if Platt were out of the way. He is a man of the machine, in whom all the lesser machine men have perfect confidence. The men who "run" conventions never had a candidate more to their liking. A ludicrous illustration of his power among them was afforded in the Convention when the presiding officer called on Senator Depew to nominate the candidate for Lieutenant-Governor before the Convention had voted on the nominee for Governor. It was assumed that Odell was nominated without taking a vote. While all this is true, there has been no irresistible demand for Odell in the sense that Roosevelt implies, or in the sense that there was for Roosevelt himself two years ago. In the latter case the demand came from the voters in such strength that the machine dared not oppose it. Now the demand comes from the machine, and the great mass of the voters are either suspicious or indifferent.

To all thinking citizens of the State, Platt's success in sloughing off Roosevelt and what he has represented in the way of better politics, will seem a huge calamity. But they will not think to the best effect if they do not reflect on Roosevelt's own share in his expulsion from the office he really desired, and in which he might have been an eminently useful servant of the State. It will be a woful falling off from Roosevelt to Odell, but the one man who might have prevented it is Roosevelt himself. With more real civic courage to lead the people in a fight against the boss—a courage, we may add, of a finer and higher sort than that required to charge up a dozen San Juan hills—he might not only have remained Governor, but have been that champion for whom Americans are looking in the fated struggle against the tyranny of machine politics.

REGULATION OF THE LOBBY.

The question of the lobby and its relation to legislative bodies is again brought before the public, through the nomination for Governor by the Connecticut Republicans of a man who was openly charged on the floor of the convention hall with "well-known activity in the lobby of the Legislature." In his protest against the selection of such a candidate one speaker asked, "Can any one with candor in his heart say that his connection with the legislation of this State for the past fifteen years, with its dark and still unwritten history, is such as to make his candidacy other than a source of grave peril to the whole ticket?" The fact that Mr. McLean has had a great deal to do with legislation without being a member of the Legislature is conceded by his friends; their defence is that such connection was legitimate.

Every session of Congress brings fresh complaints of lobbying, which increase as the closing days come on. All good citizens agree that there is much which is discreditable and even disgraceful about lobbying, as it is now practised, whether at Hartford or in Washington; yet some of the best men in Congress are of opinion that a lobby of the right sort is a useful and convenient adjunct to legislation in these days of overwork and hurry. No less distinguished a lawmaker than ex-Speaker Reed of Maine, when he was in the House, used to say that there were no terrors for him in a call from a lobbyist, and that he was always willing to go out and see one, unless he had reason to believe the man a rascal. "If any person can tell me more about a pending bill than I know already," he would ask, "why should it be my duty to shun him?" All Mr. Reed insisted upon was that the lobbyist should be clean-handed, stick to his legitimate business, and hold his interviews with Congressmen outside of the legislative chambers.

Fifty years ago there may not have been any need of even such a lobby as Mr. Reed had in mind, since the task of legislation was then far less complex. But the continual increase in the number and variety of topics with which Congress has to deal, makes it impossible for any member to keep abreast of his work with only his personal store of knowledge to draw upon. The number of bills which explain themselves is comparatively small, after one leaves the domain of mere routine legislation. There are boundaries to be rectified, where a public survey has trespassed upon private property; there are taxes to be returned, after erroneous collection; there are sometimes righteous distinctions to be drawn between the individual beneficiaries or victims of general legislation. On all these points the most intelligent members welcome guidance, and no discredit need attach to the work of instructing them; and, besides being shown what to do and how to do it, they need frequent prodding to keep them up to their duty.

The worst feature of existing lobby conditions at Washington is the lack of any visible distinction between the reputable and the disreputable lobby. The only recognized definition of a lobbyist is a person who, from the outside, tries to influence legislation concerning a private or special interest. It is hard to say by just what test we shall distinguish, from a legislative point of view, between a general and a special interest. And since not every special interest before Congress is bad, or every general interest worthy, each case must be judged on its own merits, and the same discrimination should be exercised between the lobby champions of both classes of measures. The lobbyist who, for a fee, will work for a bill which he believes to be bad, stands upon the same plane as the attorney who makes mere merchandise of his license to practise before the courts. But we do not disbar a lawyer because, where he does not consider that any taint or wrong attaches to a case, he accepts a retainer for presenting its best side to judge and jury.

Here we touch the real essence of the lobby question. Why should not Congress, for its own protection, if for no other motive, establish a legislative bar, with standards as high in their way as those of the bar of the Supreme Court of the United States? The State of Massachusetts enacted in 1890 a law "relating to the employment of legislative counsel and agents," and has once or twice since amended it. The President of the American Bar Association, in his address at its recent annual meeting, endorsed this statute, and commended the action of the last Maryland Legislature in passing a law modelled upon the Bay State's example. The essence of the Massachusetts law is publicity. It requires the sergeant-at-arms to keep two dockets. In one must be entered the names of counsel employed to appear before committees, as well as of those who make a specialty of certain branches of legislation; in the other, the names of the agents employed for any general purpose in promoting or opposing legislation; and in both must be given the names and addresses of employers and employed, the date and term and character of the employment, and other important particulars. If a person combines the work of counsel with that of agent, he must advertise the fact by appearing in both dockets. Counsel and agents must file, in connection with the entry of their names in the dockets, credentials for their authority, signed with the full names and business addresses of their employers. Punishment for wrongdoing by any counsel or agent involves disbarment for at least three years, together with a fine of from $100 to $1,000; and any employer who fails to meet any of the provisions of the law, including a sworn statement of the expenses incurred by him in promoting or opposing legislation, is subject to a similar fine.

The testimony of disinterested critics, who are in a position to watch the working of the Massachusetts law, is that it has operated in the interest of clean legislation, and that it has diminished the number and raised the grade of men constituting the "third house." Its chief fault, according to the same authority, is that it does not reach far enough; for it provides no initiative on the part of the State's officers to call to account persons who are suspected of illicit dabbling in legislation from the outside, and it is also open to evasion in various ways. The puzzle is how to make the law more effective without infringing upon the rights of the public. Still, no one can deny that it gives reputable men an opportunity to engage in a useful pursuit which many now avoid for fear of inferentially smirching their good names. The man who, in defiance of such a law, plies his trade as a lobbyist without registration, brands himself as at least a potential rascal. The statute may not furnish the police authorities with the means of punishing him; but he cannot escape the moral pillory, and his disgrace will be shared by every legislator who is seen in his company.

THE RUSSIANS IN MANTCHURIA.

HARBIN, June 23, 1900.

The Chinese Eastern Railway is already almost an accomplished fact. It is not three years since that its survey was commenced. At the present time trains are running over more than a thousand miles of its various lines, and the remaining eight hundred are well along towards completion. The rapidity of its construction is the marvel of modern enterprise. Its completion means the ultimate possession by Russia of the fairest portion of the disintegrating Chinese Empire and the firm establishment of the Muscovite power on the Pacific Coast. Vladivostok is ice-bound during the winter months. Port Arthur is one of the finest naval stations in the world, and commands the entrance to the very capital of China.

I have just made the trip over the section of the railway from Port Arthur to Harbin, a distance of 600 miles. For four hundred miles we availed ourselves of construction trains. For the remaining two hundred we were driven to the use of Chinese carts drawn by mules. From Port Arthur to New-Chwang, at the head of the Gulf of Lao-Tung, the road runs along the southern base of the range of mountains forming the Lao-Tung peninsula, of which Port Arthur forms the nose. The mountains are bare of verdure, and have the general bluish-gray color so predominant in the Rocky Mountains. The peaks rarely rise more than 3,000 or 4,000 feet above the sea, and uniformly reveal the outlines of long-continued erosion. Conical forms abound, and the entire sky line is graceful and picturesque in the extreme. The arable land is fertile, and the occasional glimpses of the sea add a charm that for tourists will make it rival in attraction the ride from Florence to Genoa in Italy.

From New-Chwang to Mukden, a distance of about one hundred miles, the railway runs along the eastern margin of the fertile valley of the Lao River. This valley is about one hundred miles wide, and forms an extension of the Lao-Tung Gulf, which has been filled by the rich sediment brought down by the river during long geological ages. Being well watered, its fertility is of the highest order. To the east of this plain the mountain chain continues without interruption and with all its varied beauty of outline. North of Mukden the valley narrows to a width of about forty miles, with a low range of mountains skirting the western horizon. Otherwise the scene remains substantially unchanged for thirty miles until reaching Te-lin, the present terminus of the completed portion of this section of the railway. But here, for the first time, the mountains become covered with green, indicating a region of greater and more equable rainfall. Shortly to the north of Te-lin, also, the western mountains disappear, and one looks out in that direction upon a plain which merges insensibly into what is marked on the maps as the Eastern Gobi Desert. But it is far from being a desert. Throughout, it is deeply covered with rich alluvial soil, and along the eastern border traversed by the railway it is well watered, and supports in affluence a dense population.

It was along this unfinished section of the road that we travelled for two hundred miles in Chinese carts. The mountains which had formed our eastern limit of vision for 300 miles still appeared above the horizon, but gradually receded as we approached the Sungari River, until from this point they are a series of blue specks scarcely distinguishable from the sky. We were told by the stately Cossack Colonel at Te-lin that as we went north the country grew more and more monotonous, but the increasing monotony has been that of unparalleled richness and fertility. On passing the low watershed separating the streams running into the Sea of Okhotsk from those emptying into the China Sea, we are evidently in an old lake bed like that in the basin of the Red River of the North, forming the great wheat area of Minnesota, North Dakota, and Manitoba. Alluvium covers everything to a depth of a hundred feet. The scenery is that of the prairies of Illinois and Iowa, and the fertility is in every respect equal. Not less than 10,000 square miles of this prairie region have come directly under our eye, and from inquiry it is certain that four times as much is equally well situated. It is only when one gets more than a hundred miles to the west that the rain is scanty, and even there it is sufficient to make good grazing country.

Every acre of the broad eastern belt traversed by us is under careful cultivation. There are no fences. Everything is planted in rows and kept free from weeds. As we passed through, during the middle of June, the fields were fairly alive with companies of from ten to twenty men at work in a place hoeing the growing grain of various sorts. The most frequent crops are of millet, sorghum, beans, wheat, hemp, indigo, and the poppy. The whole belt is a continuous garden. When the railway is completed, nothing can be more pleasing than a ride through these fields during the months of July, August, and September. Nor is this an exceptional year of fertility. Everywhere there is the appearance of thrift and contentment. Noble groves of trees appear at frequent intervals, enclosing the dwelling-places both of the living and of the dead. The houses are in good repair, and generally supplied with generous stacks of sorghum stalks for wind-breaks and fuel. Sorghum, by the way, is perhaps the most important of all the productions of the region. But it is not the sugar-producing variety. Its seed furnishes food for the working animals, while its stalks are woven into the walls of their houses and laid upon the roofs preparatory to the necessary covering of mud to protect from cold and moisture; and as fuel it is almost as good as wood. At present, indigo and opium form the most important staples of export.

In obtaining practical possession of Mantchuria, Russia has not only won its long-coveted military vantage-ground on the Pacific, but it has acquired one of the richest provinces of the world, already possessing a population larger than that of New England, New York, and Pennsylvania combined. The single district of Lao-Tung has 12,000,000 inhabitants. The total area of the province is 390,000 square miles. But, though the mass of the population is collected in the central portion penetrated by the railways, the extensive mountainous regions on both the eastern and the western borders contain vast undeveloped mineral resources and valuable forest areas. The railway is sure at once to have a large and profitable local traffic. Tens of thousands of mules now engaged in hauling the surplus products of the interior to New-Chwang, over the most horrible roads in the world, will at once resign in favor of the steam engine; new industries will arise as soon as exchange is facilitated; and, if the Mantchus are like the Japanese and the Chinese about Pekin, they will be induced by low fares to crowd the local trains for short trips to and fro upon the line.

As a military measure, the value of the railway is apparent on a slight inspection of the map. By it the Trans-Baikal is brought into direct connection with an open port on the Pacific in the latitude of Washington. Harbin, the "solar plexus" of the system, situated on the Sungari River, is about equally distant from Port Arthur, Vladivostok, and the border of Trans-Baikalia, while good river navigation connects it with the ocean through the Amur during the summer months. From this point the railway is being constructed outwards in three directions, while construction is in progress inwards from the three termini. Within less than a year the whole line will be opened and 100,000 troops could be transferred from Vladivostok, on interior lines, to the vicinity of Pekin in a few days, while within two weeks another 100,000 could be brought into the same field from the heart of Russia. As a land force, Russia will then be supreme in the Far East. As a naval Power, she will also have the advantage of possessing two capacious and invulnerable harbors in close communication with all the internal resources of the Empire.

To this condition of things the philanthropist surely cannot object. For Russia will surely introduce into the region a higher civilization, and in the wake of her rule will spring up better established order and the prosperity sure to attend it. To obtain this position was a part of her national destiny. No self-respecting Russian could think of resting until this end was attained. It is not likely that Russia's ambition will seek for more. G. FREDERICK WRIGHT.

THE PARIS EXHIBITION.—IX.

THE SCULPTURE.

LONDON, August, 1900.

The drawback to art exhibitions, as a rule, is that the artist's work must necessarily be shown under entirely artificial conditions. A painting designed to decorate, perhaps, a dark corner in a church, hangs on the wall of a gallery in the merciless exposure of a top light; a statue intended to ornament the façade of a building is placed among a hundred others in an open court with as much thought for arrangement as there is for the tombs in a cemetery. Again and again you feel the injustice to the artist of criticising either the picture or the statue until you can see it where and how he meant, from the beginning, it should be seen. Now, in Paris, as I have said, this drawback has been done away with to a certain extent. Whenever possible, the artist has adorned the buildings with his paintings, or mosaics, or sculptures. The result is, without question, interesting. But, while it helps one to form some idea of the general character and tendency of the painter's and sculptor's work in France to-day, it often makes the study of individual performance very difficult, and this difficulty I felt especially in the case of the sculpture.

If you enter by the Porte Monumentale, you will find the long avenue leading to the Palais des Beaux-Arts lined on either side by statues. More statues are placed in front of the two palaces, where it is with pleasure you note the prominence given to Mr. St. Gaudens and Mr. MacMonnies. Sculpture forms an important part of the scheme of decoration of both buildings and of the bridge; it completes the design of several of the foreign pavilions along the Seine; it is a feature of the exhibits in other pavilions and in the Palaces of the Industrial Arts. In a word, you can hardly go anywhere in the grounds that you do not come upon examples of the sculptor's art. And not only this: in the Grand Palais, though the large court is reserved for the Decennial Collection, and the charming smaller circular court in the Avenue d'Antin wing of the building for the Centennial, much of the sculpture is scattered through the picture galleries, where it adds materially to the decorative effect, but also not a little to the confusion of the student! It seems impossible not to overlook many things that do not deserve to be overlooked, not to lose something of your sense of proportion in the course of wandering from one end of the huge enclosure to the other—and even further, if you visit M. Rodin's special exhibition. But however much may be missed, however bewildered you may find yourself at times, there can be no doubt of the impression left by the collection, inside and out of the Grand Palais, as a whole. It is one of wonder at the immense skill and facility of the modern French sculptor, and the perverse conception of the end and object of the art to which his technical accomplishment has led him. Surely, since Lessing, in the 'Laokoon,' laid down the law of moderation in xpression, never has that moderation been so sinned against as at the present day. It is the flamboyancy, the exaggeration, the restlessness of modern sculpture that is its weakness.

Classicism, with all its faults, all its chilling influence, at least kept the artist within bounds. It allowed no scope for the expression of emotions, whether sham or real. The little circular court may leave you cold and unresponsive, but the general effect is one of dignity and repose. The Romantic movement, however, made for extremes, it encouraged the emotional. From Barye, with his animals, to Rodin, the sculptor of emotion, as he might be called, there is more and more action and movement. Dramatic feeling begins to be prized above beautiful form, until in the younger men restraint, evidently, would be looked upon as a sign of feebleness. M. Rodin's famous Balzac proved to what mistaken lengths the very greatest may be drawn. In M. Frémiet, as he is represented in the Centennial Collection, you are still more conscious of the struggle; he can be as restrained as anybody in a statue like the dignified little "Porte-falot à cheval, au XV^{e} Siècle," that has much of the charm and distinction of the Jeanne d'Arc in the Place des Pyramides. But in his prehistoric groups, his prowling gorillas and young elephants, he oversteps the line, and seems to be vying with the innumerable artists of the moment who seek applause by violence of action and immoderation of expression. However, what appears to be excessive here, would be reticence itself in the larger court. Probably because space was limited, the earlier work has been chosen with much discretion. All the best-known men of the century—Rude, Barye, Falguière, Frémiet, Rodin, Carriès, Barrias, Mercié—have their place; but the multitude who, for years, filled the huge court of the Palais de l'Industrie to overflowing, are excluded, and, as a result, there is in this Centennial series comparatively little of the exaggeration that elsewhere offends you at every step.

You have but to pass down the wide hall that connects the circular with the large court, to realize the difference. At once, you are in a wilderness of squirming figures and twisted and tortured bodies, all in attitudes that could not be retained for a minute, and all, in defiance of Lessing, fairly screaming and shrieking at you for notice. The truth is, the sculptor is submitted to no less severe a competition than the painter. Notice is what he craves at any cost, and he, too, hopes to win it by turning out his Salon or Exposition *machine*, only in marble, or plaster, or bronze, instead of in paint. Everywhere, on all sides, you are confronted with this same over-emphasis in action, in expression, in composition. Perhaps the competition is really harder for the sculptor, whose initial expenses are heavier than the painter's, but the demand for whose work is less; and the tendency to exaggeration, to eccentricity of one kind or another that shall attract attention to his ability—and he usually is able—grows upon him. The worst of it is, in the end, that all but the greatest are influenced by this new and ever-growing pandemonium of inappropriateness that seems to be mistaken by the modern Frenchman for sculpture. Even M. Bartholomé cannot wholly escape. His monument to the dead, already seen at the Champ-de-Mars, is probably the most solemn work, the most severe in intention, in the entire French exhibit. I have already noticed it in writing of the Salon, and pointed out the grandeur in the very simplicity of the composition: the open door in the centre, with two nude figures on the threshold, the darkness of death beyond, and, on either side, groups weeping and wailing against a wide surface of uncarved stone. There is absolutely no ornament, nothing to break the severity of outline; but, as if in forced concession to public taste, in one or two of the watchers at the tomb grief is so unrestrained that you might fancy Lessing asking what it leaves to the imagination. The evil, however, is not here sufficient to mar the solemnity of the design, but it becomes more pronounced in the case of Frémiet. His "St. George Slaying the Dragon" has a delightful swagger, where the other equestrian statues are only posing and grimacing, but he has chosen the extreme moment of action; the horse rears until you have the unpleasant feeling that in another second he and his rider must topple over backwards into the coils of the dragon. What a contrast to the "Porte-falot" in the circular court! Or, again, look at the "Jeanne d'Arc" by M. Dubois, which also is simple compared to the self-conscious efforts that surround it, but there is discomfort in the very way the maid holds up her sword. The Jeanne d'Arc in the Place des Pyramides is as warlike, as martial, but there is no suggestion of fatigue in her attitude. Again, a similar tendency reveals itself in the work of M. Falguière—his last—and M. Dalou; in the jewel-like arrangements of M. Carriès, M. Rivière, and M. Charpentier, who are almost unduly preoccupied with color and the ornamental value of their materials; and so I might go through the list, adding example to example.

I confess that at moments I felt there must be right in numbers, that, where the majority were of such accord, there must be legitimate reason for doubt. And then, doubt was silenced by two works, not very far apart, that stood out as a reproach, not to all, of course, but to by far too large a proportion of the collection. One was M. Rodin's "Baiser"—for, though M. Rodin has his own exhibition and contributes to the Centennial series as well, he has spared to the modern section one of the most beautiful and simple of all his groups, almost classic in its perfection of form and loveliness of flowing line. The second was Mr. St. Gaudens's "General Sherman," too well known for me to attempt to describe it anew. But though, as seen here, I was still conscious of what seems to me to be a defect in it—the position of the fine Victory, who looks less as if leading the way than as if in immediate danger of being trampled under the horses' hoofs—nowhere have I been so impressed with the dignity and splendor of the statue: the movement expressed by just the right degree of reserve (there is no uncomfortable anticipation of the horse galloping off into space), and the figure sitting so well astride, the figure of a man born to command. As far as the sculpture is concerned, the Exposition is Mr. St. Gaudens's triumph.

The French have amiably given the American sculptors a conspicuous part of the centre of the court, and, towering above the "General Sherman," overshadowing, you might say, the unfortunate monument to

Victor Hugo that is the chief centre of all, are the two groups of horses by Mr. MacMonnies. This is one of the instances when you are more than ever convinced of the necessity of seeing a work of art, not in an exhibition gallery, but on its proper site. Even here, despite the disadvantage, there is no mistaking the astonishing vigor of modelling, the force, the strength of the two groups. But, hemmed in, as they are, by countless other statues and monuments, as florid and flamboyant as can be, they seem a little out of scale, and it is not easy to see them properly from any point of view, though they dominate the court as you come in by the main entrance or look down from the balcony. However, Mr. MacMonnies, with these, and his "Venus and Adonis," "Bacchante," and "Shakspere," among other things, proves himself, as he often has done already, one of the most powerful of modern sculptors. It must be remembered that Mr. St. Gaudens's "Shaw Memorial" is excellently placed at the head of the great stairway, that his "Puritan" is in front of the Petit Palais, and that he exhibits besides a bas-relief of an angel with a tablet, and several medallions. There is also work by Mr. Proctor and Mr. Bartlett, and, altogether, it is astonishing that, restricted in numbers as the American sculpture is, it should make the most impressive showing of all. My one regret was that Mr. French, whose work I do not know so well, should have sent nothing but his equestrian statue of Washington that stands under the portico of the insignificant American Pavilion; and that, to me, was a very serious disappointment—it may be because I expected too much.

Many of the other foreign sections can boast one or more distinguished sculptors. Great Britain suffers from the inexplicable absence of Mr. Alfred Gilbert, but there are, fortunately, characteristic contributions from Mr. Onslow Ford, Mr. Frampton, Mr. Drury, and two or three besides, all of whom, certainly in their decorative work, have had a large influence, not only in England, but on the Continent. Mr. Frampton's most important statue stands just outside the Grand Palais. Mr. Ford's tomb of Shelley is conspicuous on a lower balcony; but it can hardly be said that the English sculptors, as a group, are as impressive or reveal as much originality as the American. Belgium has Constantine Meunier, who, with the chisel, has dignified Labor as truly as Millet did with the brush. Russia has Antokolsky and Vallgren; Hungary, Zala, whose huge Archangel Gabriel and allegorical figure of Hungaria, though still more out of scale in the court of the Grand Palais than Mr. MacMonnies's horses, are so characterized by large simplicity that the chances are, when in their decorative place, they will be effective enough. But, as a rule, in the foreign sections, as in the French, extravagance prevails, and I am not sure that it does not reach its utmost limit in the work of the Danes, who, especially in the case of Willumsen, are as deliberately fantastic in their sculpture as in their painting, or in that of the Italians, more particularly of Biondi, whose "Saturnalians," with the many figures and riotous abandonment of gesture and action and expression, naturally held the crowd spellbound before it. I never passed that it was not besieged.

All this is depressing. But matters seem far worse when you come to consider the sculptures decorating the different buildings. Inside the court, the conditions offer an excuse for any apparent shortcomings. But no such excuse exists for the work that ornaments the two Palaces of the Fine Arts, the new bridge, the Salle des Fêtes, the Château d'Eau, and so many other palaces and pavilions. Statues and groups are in the architectural setting for which the sculptor knew, from the first, they were destined. And yet it is in the sculpture thus put to definite decorative use that the prevailing restlessness, the irrepressible distortions and contortions are most aggressive. Repose or restraint is all but unknown. Moderation is scarcely understood. Every outstretched arm or leg, every flying drapery, is a separate bid for your attention. It is not a mere figure of speech to say that you cannot see the Grand Palais for its decorations. The feverish haste to cover up all the buildings is particularly regrettable in the case of these permanent palaces. Every space has been as hurriedly filled as if speed were the one merit demanded. No great work has ever been done in so headlong, impetuous a fashion, nor was there any reason for this exemplary promptness. The palaces are to remain, and the Exhibition would not have suffered had all the spaces been left empty of ornament until long after its gates have closed. That the work could be finished on time is, no doubt, creditable enough from the standpoint of industry and application. But, though you may never cease to wonder at the many sculptors who are competent and accomplished craftsmen, neither can you help lamenting that, for all their accomplishment, so few should be artists. The French sculptor has the technical ability to do almost anything if only he had the supreme gift of all—the knowledge of the right thing to do. M. Rodin is one of the rare exceptions, and he is not always infallible.

N. N.

Correspondence.

AS BETWEEN McKINLEY AND BRYAN.

TO THE EDITOR OF THE NATION:

SIR: I do not know that what I wish to say is worth your perusal, but I will offer it.

In your No. 1833 (August 16) you say, in response to a request from Mr. Francis Fisher Brown, "Our way is very simple—to refrain from voting for McKinley, etc., etc." Feeling that this will not satisfy a good many who have the welfare of our country very much at heart, I would give the following reasons for taking your advice, and then ask if it would not be well to go further than you advise and vote for Bryan.

In the first place, Mr. McKinley stands for a high and, in some important cases, a prohibitory tariff. Now, I believe that God has made of one blood all the nations of the earth, and I cannot but believe that it would be pleasing in his sight for all nations to entertain kindly feelings toward each other; that he has given to different sections of the earth different kinds of wealth, and has given different kinds of capacity to the different peoples of the earth; that a free interchange of these gifts to man is a very great promoter of good feeling. So, as a Christian, I am for coming as near to free trade as possible. As a lover of my country I denounce high tariffs as a great cause of corruption at home, enmity abroad, and injustice to the large majority of our people.

Now, as for the financial part. The Republican party is not only responsible for the legal tenders by which a debtor was for years enabled to get free of a debt contracted in good money by paying for the same in a depreciated currency, but also for the rascally use of the word "coin" on many of our bonds. Let any one follow the Republican party in its relation to the legal tenders, remember what the law now is, and ask if a greater financial heresy ever existed in the history of our country.

If my memory serves me correctly, the passage of the bill for enlarging the army was facilitated by the assertion of a member of Congress close to the President that the President would rely chiefly on volunteers, and would not resort to a draft unless compelled to. Now let our people look the matter square in the face. Are we prepared to have a conscription for the sake of holding millions of people on the other side of the earth in subjection for ever, or even until they can establish a *stable* government of their own? A *stable* government! We may flatter ourselves that we have a *stable* government. Wherein is the stability, if not in an exact adherence to the Constitution? Will it do to trust to any one's (however exalted among men) "sense of duty"?

With combinations of capital to shape its course and Rough Riders to carry out the programme, I see no hope for the country in the Republican party. The worst features in the Democratic platform have either their origin or their encouragement in what the Republicans have practised for years.

You may have thought my question about the four hundred million of silver dollars in the Treasury rather an idle one; but if you have perfect faith in their being paid out *only* in redemption of silver certificates, never mind what emergency might arise, your faith is greater than mine.

Yours truly, JAS. B. NOURSE.

WASHINGTON, D. C., September 5, 1900.

IMPERIALISM IN PORTO RICO.

TO THE EDITOR OF THE NATION:

SIR: In addition to those you mention, in your answer to your correspondent who asked an explanation of the present government of Porto Rico, some other features of the law perhaps deserve notice in view of the claim, now frequently made, that Imperialism is imaginary.

It is not only true, as you say, that the government of these people, the first subjects of the United States, is in the hands of its President, but the statutory laws of this alien country "not locally inapplicable" have been imposed upon them by section 14. Moreover, not merely a majority, but ALL of the members of the Executive Council are appointed by the President. The strong language of Governor-General Wood quoted in your issue of August 30, emphasizing the injustice of subjecting any people to the "decisions of tribunals composed of persons alien in race and sentiment, administering a system of laws with which [they] are entirely unfamiliar," applies forcibly to the provisions of sections 33-35, whereby the courts and tribunals established in the island by the army of occupation are continued and a court styled "The District Court of the United States for the District of Porto Rico" is created, all the pleadings and proceedings in which must be conducted in the English language.

All of the judiciary of the island are to be or have been appointed by the President or his appointee, the alien Governor. Writs of error and appeals from the Supreme Court of Porto Rico, as well as from the District Court, are taken to the Supreme Court of the United States. In the face of this sample, it is rather surprising to read how glibly the people are assured that Imperialism is a bugaboo, and that Mr. Bryan's speech of acceptance shirked the real issue.

CHARLES B. WILBY.

BIDDEFORD POOL, ME., September 4, 1900.

THE ROUSING OF THE BEAST.

TO THE EDITOR OF THE NATION:

SIR: A lively contemporary ironically compliments the Springfield *Republican* upon its ingenuity in discovering a connection between the Akron riots and the Philippine war. I do not know what the *Republican* proves or disproves in the article referred to, but have no doubt that a real connection exists between these two phases of contemporary history. There lies in each of us, buried more or less deeply according to the character and antecedents of the individual, the old animal love of carnage. Civilization may have put this bestial passion to sleep and covered it with layer after layer of æsthetic tastes, social sympathies, and fine manners. Nevertheless, every Darwinian (and most scholars and thinkers are Darwinians nowadays) knows that it is there. It is our inheritance from half-human ancestors. Christianity and civilization have striven for centuries to kill out this passion. Perhaps some day it will perish, as unused organs have done in many forms of life. But meantime it is merely "scotched," and, under fostering conditions, it can waken as thoroughly as did the frozen serpent in Æsop's fable when it was warmed by the peasant's fire.

The worst evil of war (as it seems to me) is its constant appeal to the fighting instinct and to the bestial love of blood-shedding. Every one who has sufficient intelligence to take an interest in the daily papers is being familiarized with the idea of slaughtering his fellow-men. The sanctity of human life is quite forgotten. The love of bloodshed which lurks in hidden chambers of the soul is brought forth and fostered. How quickly it can grow is shown by some extracts from soldiers' letters which have been published in our papers and in Canadian journals. Their absolute savagery is sufficient evidence how soon all the painfully acquired spiritual results of civilization and Christianity can be lost. Young lads whose minds are developing and whose characters are forming, are daily regaled with details of carnage; and the illustrated periodicals especially, with their pictures of charging battalions and bursting shells, have infused every mother's little son with the spirit of battle. It is disastrously easy to arouse this spirit. It is not easy to direct or to restrain it.

The riots in Akron and in New York city and the disturbances in the South are but the natural expression of this aroused spirit, *and, unless the present* scribe is a false prophet, there will yet be similar scenes on British territory as an indirect result of the South African war.

A STUDENT OF BIOLOGY.

"EQUITY" AND THE BOERS.

TO THE EDITOR OF THE NATION:

SIR: Your correspondent "Equity" (in No. 1835) makes some statements about the Boers which ought not to pass without a word or two of comment. He says that they have been treated throughout the war as regular belligerents, and seems to think this a proof that the Transvaal has been recognized by England as a foreign state. I rather think that the Boers have been considered about the same sort of "regular" belligerents as were the Southerners at the time of the secession war, and not used any worse, though in many respects they have behaved far worse.

"Equity's" claim of foreign nationality for the Boers simply begs the whole much bewrangled question of the suzerainty, and cannot be settled by his mere anonymous *ipse dixit.* A state owing its existence to England's authority, forbidden to make foreign treaties without her consent, and peopled at the outbreak of the war in the proportion of about 120 English to 80 Dutch, was hardly in a position to set up for "an independent foreign nation" upon a violent anti-British basis.

"Equity's" assertion that the Boers have observed the laws and humanities of war is contradicted by many well-known facts. Has he never heard or read anything concerning the outrageous and systematic abuse of white flags and red crosses? Of uniformless men claiming to be either soldiers or civilians according as time or place might be convenient? Of oaths of neutrality or allegiance sworn and broken at the swearer's discretion as often as he was allowed to avail himself thereof? Men's lives have often been forfeited for such offences as these with approval by the rules of civilized warfare, and long before the Boers were ever heard of. How might French or German or United States soldiers be expected to act when opposed to an enemy holding and practising such peculiar views of the "laws and humanities of war"? Not much better, I fear, than the brutal English.

Though "Equity's" letter is very short, it would take a long reply to expose all its misrepresentations. I shall only notice one more. He speaks of Boer women and children being turned out to perish. On the contrary, it is well known that, in the course of this war, the wives and children of many Boers have been supported and *kept from starvation* by this same much-maligned English Government, while their husbands were fighting against it. An odd fact in this connection is that, just before the war broke out, several influential Boers living in the Republics sent their families to Cape Town to be out of harm's way, and under the protection of their "brutal" enemy until the war should be over.

L. C. ALLISON, M.B.

ST. JOHN, N. B., September 5, 1900.

TREATMENT OF PATRIOTS AS REBELS.

TO THE EDITOR OF THE NATION:

SIR: You say, "Since the proclamation of annexation [in the Transvaal], burghers found with arms in their hands are technically rebels, and subject to hanging for treason."

You surely would not lend your authority to the doctrine that a successful invader, having overrun a country, can, by proclaiming it annexed, entitle himself to treat all patriots who hold out as rebels, and hang them, when he catches them, for treason.

Maximilian, for treating Mexican patriots who held out against his empire as rebels, was himself shot; and though everybody pitied him, his doom was regarded as just.

Napoleon destroyed the patriot armies of Spain and established the monarchy of his brother at Madrid. But Spanish patriots held out as guerrillas, and were accepted as allies by Great Britain in a series of campaigns.

Hofer and the Tyrolese peasantry held out after the annexation of the Tyrol to Bavaria. England sympathized in the most marked manner with their resistance, and the execution of Hofer as a rebel has always been regarded as one of the vilest acts of Napoleon.

Lord Roberts, it seems, proclaims his intention of shooting any burgher of the Transvaal who fails to give him notice of the presence of a patriotic force. What would have been said if such a proclamation had been issued by the German invaders of France?

The British, it appears, are now transporting their prisoners of war, who have every possible claim to the character of regular belligerents, to Ceylon; the families of these prisoners in South Africa being left to their fate.

Are such to be the fruits of the Convention at The Hague? Is American opinion on these questions dead, or has it been bribed to silence by the service supposed to have been rendered to the United States by the British Government at the time of the Spanish war?

EQUITY.

September 8, 1900.

[The context shows that we were merely stating the British point of view, which has, however, far greater justification than our treating the Filipinos as insurgents.—ED. NATION.]

THE SCHOOLBOY'S VOCABULARY.

TO THE EDITOR OF THE NATION:

SIR: After reading a letter in the *Nation* of this week from J. H. Dillard, I wish to urge, as one reason for the poverty of vocabulary of many graduates of our schools, the great variety of occupations imposed upon them during their school years—a variety which often limits their study of the English language and its literature to very small proportions.

In the public schools of Brookline, Mass., are taught a number of natural sciences besides drawing, singing, carpentry, domestic science, sewing and dressmaking, all of which necessarily crowd out the technical study of the English language. On visiting a very elaborately equipped schoolhouse in Brookline last winter, I asked a seventh-grade teacher of six or seven years' experience, whether all this table-setting, bed-making, sewing, and dress-cutting did not lower the standard of "book-learning" among her pupils, and she said that such was certainly the case. Now, although a great deal of this teaching is of more practical value to many of the pupils of the public schools than too much literature, it seems to me a great mistake to try to combine the classical and literary school with the industrial school; both lose by the combination, and the study of the English language is often absolutely neglected for a time.

A boy of fifteen, who was transferred last winter from a school in another State to one of our Massachusetts high schools, was not called upon to write anything in the nature of an abstract or composition during the first two months of his attendance; his studies during this time were Roman history, Latin, algebra, drawing, and singing, some time being spent at prayers and gymnastics. Now, if the "daily theme" courses in the colleges are as beneficial as they are considered to be, two months seems far too long a time to allow the very imperfect English of the average boy of fifteen to remain uncriticised. The reaction from teaching exclusively from a text-book to the modern topical method of treating English literature is, to my mind, another evil when the teacher, as is too often the case, has no great love for the best literature, and does his work in a rather perfunctory manner. In some grammar schools which I have known, studying poetry meant studying the poems of Longfellow almost exclusively.

I do not know the "Scholar's Companion," mentioned by your correspondent, but some of the old-fashioned text-books of English literature which give extracts from a variety of authors, would have a far better effect in forming a good English style than such a treadmill routine as this. To obtain good results from many methods of teaching now in fashion, the teachers should be, not only well trained, but endowed by nature with a wonderfully large amount of judgment and good taste; this, it will be said, has always been the case, but not to any such degree as at present, when the text-book, although improving yearly in quality, has, in the teaching of such studies as history and English literature, fallen somewhat into disrepute.

NANCY S. HOOPER.

TAPPAN ST., BROOKLINE, MASS.,
September 7, 1900.

Notes.

Huxley's Life and Letters, edited by his son Leonard, in two volumes, overshadows in interest the rest of the preliminary list of Messrs. Appleton which it leads. We cite also 'The Private Life of the Prince of Wales'; 'The Boers in War,' by Howard C. Hillegas; 'Commodore Paul Jones,' by Cyrus Townsend Brady; 'The Story of the Soldier,' by Gen. G. A. Forsyth, U. S. A.,' in Mr. Ripley Hitchcock's "Story of the West" series; 'Hungarian Literature,' by Dr. Zoltan Beothy; 'The Art of Writing English,' by Prof. J. M. D. Meiklejohn; 'The Individual,' by Prof. N. S. Shaler; 'Some Women I Have Known,' by Maarten Maartens; 'Clearing-Houses: Their History, Methods, and Administration,' by James G. Cannon; an illustrated edition of 'David Harum'; and 'The Brass Bottle,' by F. Anstey.

The Century Company will publish next month 'Dr. North and his Friends,' by Dr. S. Weir Mitchell; 'The Strenuous Life,' by Gov. Roosevelt; 'The Gospel of Wealth,' by Andrew Carnegie; and 'College Administration,' by President Thwing of Western Reserve University.

Further announcements from Little, Brown & Co. are a new volume on Japan, 'Shadowings,' by Lafcadio Hearn, and a new edition of Parkman's 'Oregon Trail,' with seventy-five illustrations by Frederic Remington.

Ginn & Co. have nearly ready 'Apes and Monkeys: Their Life and Language,' by R. L. Garner, and 'Wilderness Ways,' by William J. Long.

'America' is the title selected for Charles Dana Gibson's October book of drawings; 'The Passing Show' for a new collection of Albert B. Wenzell's drawings. Both will be published by R. H. Russell.

Elder & Shepard, San Francisco, will soon have ready 'The Religion of Democracy,' by Charles Ferguson.

Macmillan Co. request us to state that the *Critic* had no foundation for its statement (bolstered by a portrait) that the author of 'Elizabeth and her German Garden' is the Princess Henry of Pless. She "was in no way connected with its authorship."

Two new volumes in Macmillan's "Library of English Classics" confirm the attractiveness of this stately series. One is White's 'Natural History and Antiquities of Selborne,' in faithful reprint of the original (1789) edition, but with the happy conjunction of Dr. John Aikin's compilation from White's papers, published in 1795, under the title, 'A Naturalist's Calendar, with Observations in Various Branches of Natural History by the late Rev. Gilbert White.' Part of this addendum represents gleanings from material already sifted by White, and part is from notes not drawn upon at all. The combination gives an especial distinction to this reissue. The other volume is 'The Travels of Sir John Mandeville,' modernized in spelling upon the Cotton manuscript in the British Museum, which is for the first time faithfully "reproduced, 'warts and all,' save in less than a dozen instances," to avoid nonsense. This has been no light labor for the editor, Mr. A. W. Pollard, who usefully enlarges the volume by appending "three narratives illustrative of Mandeville," namely, Carpini's voyage, William of Rubruck's journal (lately edited by Mr. Rockhill for the Hakluyt Society and noticed by us a few months ago), and Friar Odoric's Journal. So again we have a conjunction that competes with any edition heretofore reproduced—in price as well as in the particulars just set forth.

The extreme rarity of a campaign life of Lincoln, writen by John Locke Scripps of the Chicago *Tribune*, in 1860, and published conjointly by that journal and by the New York *Tribune*, justifies the reprinting of it since it is the earliest in existence. It is a good specimen of its class, and had the advantage of some communications from the subject of it. It is now issued in quarto form, with much mechanical care and general good taste (particularly in the binding), from the Cranbrook Press, Detroit, to the number of 245 copies. Of Mr. Scripps, who owed his prenomen to a family connection with John Locke, there is a frontispiece portrait and a biographical sketch. His father was an Englishman, and, curiously enough, was one of the framers of the Missouri Constitution in 1820; and in that State he himself was born, so that Mr. Lincoln's first biographer was, like himself, a Southerner.

Two more books about "Trusts" are at hand. One, by William Hudson Harper, is entitled 'Restraint of Trade' (Chicago: Regan Printing House), and contains a heterogeneous mass of arguments, opinions, and facts, from which the reader may pick what he wants. The other, by William Miller Collier, is called 'The Trusts: What can we do with them? What can they do for us?' (New York: Baker & Taylor Co.). Publicity is the panacea recommended by this writer; not without some display of knowledge and argument.

It seems a far cry now to Émile Gaboriau, the specialist in what his countrymen call "le roman judiciaire," with its elaborate mystery and its sometimes clumsy gathering up of the threads. Osgood's 1875 edition, in five volumes, of 'Monsieur Lecoq,' 'The Mystery of Percival,' 'The Honor of the Name,' 'File No. 113,' and 'Other People's Money,' has just been revived very presentably, with illustrations, by Charles Scribner's Sons. The titles speak for themselves, and will attract those who are fond of "detective" stories.

We noticed with commendation on its appearance the first part of 'A French-English Military Technical Dictionary,' by Lieut. Cornélis De Witt Willcox, U. S. A. (Washington: Adjutant-General's Office). The work is now completed, in three parts, numbering nearly 500 pages. For an appendix is given the French Revolutionary Calendar, in correspondence with the Gregorian. The work is a very valuable addition to the best of French dictionaries. For example, not one of the six compound expressions under *dé—dé agrafe, dé briseur*, etc.—is to be found in Hatzfeld.

Dr. William Everett's Phi Beta Kappa oration on "Patriotism," not of the new-fangled kind, is placed where it belongs in the forefront of the *Harvard Graduates' Magazine* for September, which for the rest is mainly a record of Commencement doings. Remarkable, however, is the account of the various buildings of novel purpose now in course of erection, which will do more to transform the life of the college than any structures for half a generation. The college fence and gateways are also to be extended and multiplied, and class devotion now resorts to this form of commemoration since the last window in Memorial Hall has been taken. The gifts of the past year have been extraordinary.

The report of the United States Fish Commissioner for the year ending June 30, 1899, just issued from the Government Printing-office, is distinguished from its predecessors by "Notes on the Foreign Fishing Trade and Local Fisheries of Porto Rico." These have been contributed by the Commission's agent, Mr. W. A. Wilcox, who accompanied the *Fish Hawk* expedition to the island in January of last year. The paper is accompanied by photographic illustrations. The remarkable water-color drawings of Porto Rican fish made on this occasion have been beautifully reproduced lithographically by Julius Bien & Co., and will in due time be published by the Commission. A curious chapter on sturgeon fishing in Delaware River and Bay concludes the present report.

The Fifth Annual Report of the Chief Fire Warden of Minnesota (St. Paul) has its moral for communities which either entirely neglect forest conservancy, or pass laws that instantly become dead letters. It is exceptionally well illustrated with process cuts from nature, and makes a strong appeal for a Government Park at Cass Lake. The bulk of the report consists of data concerning European forestry.

A belief has prevailed since ancient times that some trees are more liable to be struck by lightning than others. Extensive investigations have recently been made in Germany with regard to this subject, and the reports, covering a period of seventeen years, present very extraordinary results. The field under survey was the forestry district of Lippe, containing mainly beeches, pines, and oaks, with a sprinkling of larches, poplars, etc. In the course of these seventeen years, about 375 trees were struck by lightning. Of this number, fully two-thirds were oaks, although barely more than one-tenth of the forest tract was made up of that kind of growth. While the beech trees covered a greater area than all the other trees combined, only one-fourteenth of the total numbers of trees struck were beeches. The larches and poplars were relatively great sufferers. It appears to be settled that trees rich in oil enjoy comparative immunity. The presence of dead limbs in the crown of the tree seems to increase the danger from lightning.

The Prussian revised orthography, introduced in 1880, and generally known as the Puttkamer system, has, as appears from a recent circular of the Association of German Book Publishers, gained a remarkable headway over other systems. Of 613 firms which sent in reports, 406 have in all their publications adopted this system, 58 employ only the old, 141 make use of both, while only 8 have the Austrian. Of the 141 using both, 59 state that they use the old only by way of exception, 30 use the old nearly altogether, while 52 employ both promiscuously. The report states that fully five-sixths of all the book publications and three-fifths of the periodicals in Germany are now printed in the orthography of 1880, and uniformity is evidently a question of only a comparatively short time. The most serious hindrance is still the disinclination on the part of officials to adopt the innovation. The great bulk of the political papers have long since given in to it. What expense attends the introduction of a new system of orthography can be seen from the experience of a single firm, which reports the cost of changing the stereotype plates of its various dictionaries to harmonize with the new system at 700,000 marks.

No recent achievement in spectroscopic astronomy has attracted greater attention than the brilliant series of discoveries of binary stars whose components are so close together, apparently, that they can never be observed optically by ordinary means. Capella, the brightest star in Auriga, is among those luminaries whose duplicity has lately been detected by Professor Newall of Cambridge, England, with the fine spectroscope given by the late Miss Bruce, in conjunction with the 25-inch refractor built by Cooke of York. Early in the present year, Mr. Newall having called the Astronomer Royal's attention to the possibility of securing measures of this binary by means of the micrometer, as in the case of optical binary systems, his assistants, Mr. Dyson and Mr. Lewis, began examination of it with the 28-inch refractor at Greenwich on April 4. Both observers agreed that the star was slightly elongated, to the extent of a tenth second of arc, and quite appreciable. Subsequently it was examined on every available night by several observers, who, in spite of the naturally delicate character of the observation, have secured a series of measures which give an orbit for the binary agreeing well with the spectroscopic period of 104 days. The detailed measures have been published in the *Monthly Notices* of the Royal Astronomical Society for June, and they are still in continuance at Greenwich. Capella thus takes the far lead of all optical binaries for rapidity of revolution.

—The *Century* for September has an antiquarian article on "Troglodyte Dwellings in Cappadocia," by Prof. J. R. Sitlington Sterrett, illustrated with drawings by Harry Fenn, after photographs by the author. Professor Sterrett traces the "cones of Cappadocia," and the fact of their having been used as human dwellings, to "the dim distant Hittite period, at about 1900 B. C." But, anthropologically, the record seems to be mainly marked by want of continuity; the present cone villages having little apparent connection with the primitive troglodytes, who sometimes wore skins, and sometimes went naked, and were so irrational as to imagine cattle and sheep to be their parents, and practised free love and euthanasia. Père Didon, the liberal priest and preacher, who died the other day, is made the subject of a sketch by "Th. Bentzon," accompanied by an engraving of what looks like a good portrait. It seems that no biography has yet appeared. Of his devotion to liberality in education and his conception of a teacher's duties, Mme. Blanc gives an interesting example. His weak point consisted in a morbid desire to let everybody know that he was "in the swim"—a consequence of the self-consciousness, or "hypertrophy of the *me*," which Marie Bashkirtseff discovered in him at first sight. The third paper of William Mason's "Memories of a Musical Life" is more entertaining than the first two. It contains a great deal about Liszt, and makes an interesting picture of him. Mr. Mason gives a curious report of the first interview between Liszt and Brahms. All other accounts—of which there have been several—are, he says, inaccurate. It seems that Brahms was so nervous that he could not play, upon which Liszt took up a rather illegible manuscript composition of Brahms, and played it at sight, to the great delight and amazement of the composer. A little later, some one asked Liszt to play something of his own—a request which he proceeded to comply with. In the most interesting portion of the performance, casting a glance at his visitor, Liszt found that the latter was dozing in his chair. Liszt played the sonata through, and then left the room. This account is corroborated by a still living witness. In an article on "The Influence of the Western World on China," Dr. D. L. Sheffield, President of the North China College of the American Board at Tung-Chau, discusses the Chinese question, but, to our mind, fails to throw much light on it. He wants England and America to announce to the world that they will "conserve the integrity" and "promote the reformation" of China, but he does not seem to understand that this means a protectorate of the most responsible character, and therefore that no reasonable man will listen to the suggestion, unless it is clearly proved why we should undertake such a burden. Dr. Sheffield's reasons seem to be that there is a great deal of trade with China, and that a few of the natives have been converted to Christianity. It is an article, for missionary consumption, which is calculated to make the ungodly laugh, and the heathen, if any fall in with it, to imagine a vain thing.

—The leading article in the *Atlantic* is a paper on "The American Boss," by Francis C. Lowell, who undertakes to analyze the causes which produce him. The writer protests against being drawn into any discussion of whether the Boss ought or ought not to be. He *is;* what causes him to exist? The answer given by Judge Lowell is not original; it has been given in substance many times before. In party politics machinery is needed; the operation of machinery requires men. These men must be paid; the Boss is the man who pays them. The argument is reinforced by the consideration that the "machine" in this case is itself a congeries of associations of human beings, acting together for certain ends, such as deliberating, voting, and nominating, or selecting others to transact such matters for them; and in competition with another machine of the same sort, the work of which it seeks continuously and zealously to upset. (This is our very inadequate paraphrase of an elaborate analysis.) The defect which we find in the article is that it wholly fails at the point where the title led us to look for light, viz., in explaining why the Boss is so peculiarly American. The *Boss Americanus* is found in New York, Pennsylvania, Ohio, and some other centres of population; but no specimen of the species has been described by naturalists in London, or Liverpool, where party politics are just as rife, or even in the South American republics, where corruption is rife enough, if that were all. One explanation would be connected with our nominating system, wholly different in this country from any other. It is odd, by the way, to find the late Mr. John Forbes invoked in aid of the scientific inevitableness of the Boss system. The requirements of partisan machinery, as he understood and explained them, belonged to a period before the present Boss system began. Magarethe Müller contributes an article on Gerhart Hauptmann, in the course of which the writer has something to say about Nietzsche and Sudermann. She insists upon a connection between these young German writers and such foreigners as Zola, Taine, Ibsen, and Tolstoi; but the bond of union between such various and divergent geniuses is a little too like that which makes us all sinners in the fall of Adam. If all the magazine articles of this sort which have been written on modern literary movements and their authors could be got together, they would present a wonderful farrago of theories and philosophies.

—"Submarine Torpedo-Boats" is the subject of an article in *Harper's* by William W. Kimball; it is illustrated by H. Reuterdahl from sketches made on the *Holland* "while running under the surface and above." The conclusions reached by the writer are that, "with properly manned submarines in the defensive, blockades cannot be held nor bombardments effected," and "in attacking ports they will be useful in countermining the protecting mines, and in entering unseen to destroy ships, dry-docks, and buildings." Thus far they have been of no practical use, for the Confederate torpedo-boat which sunk the *Housatonic* off Charleston, though designed to work as a submarine, made her attack as a surface boat, and then went down with her crew, "as any successful torpedo-boat may expect to do." France, it seems, has grasped the idea of the importance of the new type, and has a dozen submarines on her naval register, and has provided for thirty-eight all told. When her coast is entirely protected by them, "she will be able to send her whole cruising fleet" to attack the enemy elsewhere. But then, it may be added, the enemy will be equally able, under similar circumstances, to do the same thing. Congress has authorized the construction of five more boats of the Holland type. The article is that of an enthusiast; there are critics who still say that there are too many difficulties in the way—the difficulty of keeping long under water, of steering, of light, air, etc. "The Teuton Tug of War" is the title of a belated article of Julian Ralph's, on the war in South Africa, and is dated "Bloemfontein, April 19." His account of the Boers is that they are an incorrigible set of savages—always lying, because they do not "know or like to tell the truth," full of treachery and cruelty. Apparently they are deserving only of extermination like vermin. His account differs so essentially from that of Mr. Selous, who lived among the Boers for twenty years, and who found them a kind, amiable, generous, and hospitable people, and did not notice their propensity to lie, that the two accounts might profitably be compared. The article recalls articles descriptive of the "Yanks" by Southerners, forty years since, and of English descriptions, in war time, of French, Germans, and other foreign tribes. There is really a striking analogy between Mr. Ralph's account of the moral character of the Boers and that given by our Jingoes of the Filipinos.

—The recognized graded division of falsehoods into lies, condemned lies, and statistics leads one to approach very warily collections of the third, whether political or sociological. But, however difficult of correlation, these may include curious facts; and such are found in a quarto Mortality Report of the Mutual Life Insurance Company, covering fifty-six years, to include 1898, and embracing 46,525 deaths. Of these only 1,540 were of women, so that the report, prepared by the Medical Directors, Drs. Marsh and White, and published by the company, is that of the deaths of 45,000 selected adult males. These cannot be employed to illustrate deaths at the same ages in the country at large, for the policy-holders were selected medically, and represent a more conservative and thoughtful class of the community. Among these the general mortality rate does not increase with age as rapidly as one might suppose. Thus, the death rate under 45 years is 30 per cent., but that from 45 to 60 is only 33 per cent. of the whole. A feature not usually appreciated is that while the general mortality increases, the causes of that mortality are very different at one age from those of another. Thus, the percentage of the entire mortality from typhoid to the total mortality was 3.94; but while in those under 25 years of age it was 18.45, in those from 25 to 29 inclusive it was 15.43; and it gradually decreased to .10. The percentage of deaths from heart diseases under 25 years was 1.15, but from 65 to 69 years it was over 18.05. Casualties show a quinquennial decrease from 15.98 to 1.57. Hence there are easily calculated curves of increasing immunity and increasing risk. Tubercular disease (roughly classed as consumption), notwithstanding the presumed exclusive effect of the medical examination, caused 28.01 of the total deaths under 25, and 33.06 of those from 25 to 29 years. Within the last ten years, however, there has been a decided decrease in the mortality from consumption at all ages, and, as this is strongly marked in very mature years as well as in earlier life, more careful physical examination cannot claim the entire credit for the gain. The largest number of such deaths occurs between 35 and 40 years of age, and the highest rate is between 25 and 30; upon which the authors remark that "these numbers do not represent the true relation of the disease to the age periods, for the excessive number of deaths at that period may and probably does represent merely an excess of the number of lives at risk." The deaths from consumption, even among the selected adults who make up the constituency of the company, are more than one in eight of the whole. The alleged increase of cancer is a topic of frequent discussion in professional and other intelligent circles. There is no doubt that the recorded deaths from that disease in tables of general mortality show a steady increase. In an attempt to throw some light on the subject, one table compares year by year for the last twenty years the deaths from cancer with the deaths from all causes in an age group of 50-70 years. The age restriction is used to prevent error that might occur were an excess of young or old persons introduced in either column. The percentage rises from 4.23 in 1879 to 7.59 in 1898, and in a general although not uniform way the increase is gradual year by year. Notwithstanding this increase of 3.36 per cent., the authors are of opinion that it can best be accounted for by greater accuracy of diagnosis. This is a compliment to the discrimination of the faculty at the expense of its clinical efficiency.

—During the past ten years Major Martin Hume has, by the publication of numerous books, associated his name with the study of Spanish history. However, his volume on 'Modern Spain' in the "Story of the Nations" series (Putnams) brings him into contact with a period which he has previously left untouched. Although issued by a different publisher, this work should be considered in connection with the work on Spain which Major Hume contributed to the Cambridge "Modern History" series. The one extended from the Emperor Charles V. (Charles I. of Spain) to Charles III.; the other begins with the death of Charles III. and reaches the present day. It seems rather a pity that, for the sake of convenience, the two volumes should not have come from the same publisher's office. The acquaintance which Major Hume shows with the later period of Spanish history does not suffer by comparison with his writings on the sixteenth and seventeenth centuries. Members of his family fought in the Peninsular War, and he has heard their stories. "Near relatives of my own were among the victims of the despotism of Fernando, and expiated in prison and exile their adhesion to the cause of the Constitution. . . . At a later period my own observation commenced, and, as a keenly interested spectator and friend of many of the chief actors, I witnessed most of the stirring scenes recounted in these pages from the revolution of 1868 up to the death of Alfonso XII." Major Hume has no belief in the theory that arbitrary government is the proper solution of Spain's political difficulties. Despite the country's calamities since the beginning of the century, he perceives an upward tendency. He considers Spain "the most naturally democratic country in Europe. 'Hurrah for chains!' will be heard no more, and a return to the days of Fernando, or even of Isabel II., is as impossible now as a return to the despotism of the Philips." Among national leaders, Marshal Prim is Major Hume's favorite, "the only really great Spaniard that the century has produced." The same sympathy with Constitutional freedom is shown in the account of Amadeo of Savoy, and his short reign. Major Hume always writes in a bright and nimble strain. His 'Modern Spain' is an example of the good "popular history."

—The brilliant array of names on the title-page of a volume of addresses, 'Discours aux Étudiants' (Paris: Colin), delivered before the General Association of Students in Paris since its foundation, sixteen years ago, will attract readers who would otherwise not be interested in a book of this kind. Who would not like to know what men like Renan, Pasteur, Jules Simon, Puvis de Chavannes, Jules Ferry, Emilio Castelar, to group together those of the speakers no longer among the living, have to say to young men of twenty or twenty-two? And poets and novelists like Anatole France, Sully-Prudhomme, De Vogüé, Zola, or statesmen like Casimir-Périer and Loubet, also, are not likely to indulge in mere lecture-room oratory. The volume is not free from tedious repetitions, and a superabundance of well-meant counsel is crowded, *e. g.*, into the several discourses of M. Lavisse; but most of the speeches are brief, and the personal note, strongly marked in most of them, is by no means unpleasant. Puvis de Chavannes needs less than two hundred words to acquit himself as President at one of the annual banquets of the Association. Pasteur, on the occasion of his jubilee (December 27, 1892), spoke scarcely more than ten minutes, and another time had to excuse himself after a few remarks to hasten to the "Institute," where poor pilgrims from Russia were waiting to be cured from the bite of a rabid wolf. Renan, of all others, quotes the *Gaudeamus igitur*, and advises the members of the Association to work hard and amuse themselves, confessing, however, that the suggestion, on his part, is "rather theoretical," since he himself has followed only the first half of it. In matters of politics, he hardly knows what to advise, being "a sort of legitimist" who, on the establishment of a new régime, waits a half-score years for the Government to become legitimate, when he finds that it is just about ready to "pack up." But these inimitable passages must be read in the original (pp. 20 ff.). Besides Renan's, the most enjoyable addresses, perhaps, among the thirty-five, are those delivered by Jules Simon and Castelar at the latter's reception, in 1889, in the amphitheatre of the new Sorbonne (pp. 333-342). By a strange coincidence the genial Frenchman had once before, on a state occasion in the Escurial, been called upon to speak when the assembled guests were really anxious to hear the illustrious Spaniard. Reminding his friend Castelar, with felicitous appropriateness, of that event, he quotes his former speech: "Very well, I will make a speech: Gentlemen, I yield the floor to M. Castelar." And, he assures the audience, his success was enormous, "c'est mon plus grand triomphe oratoire." We should like to quote other passages from the volume, some witty, others serious. There is Zola's generous confession: "I have already regretted having been a sectarian, in insisting that art should confine itself to demonstrated truths. The new-comers have reopened the horizon by reconquering the unknown, the mysterious; and they have done well." Then, there are aphorisms, nuggets of thought, scattered throughout the book which more than make up for occasional commonplaces and empty rhetoric.

THE WELSH PEOPLE.

The Welsh People: Chapters on their Origin, History, Laws, Language, Literature, and Characteristics. By John Rhŷs, M.A., Principal of Jesus College, and Professor of Celtic in the University of Oxford; and Dāvid Brynmor-Jones, LL.B., Bencher of the Hon. Society of the Middle Temple, Queen's Counsel, and Member of Parliament. With two maps. The Macmillan Co. 1900.

This is by all odds the most important treatise that has yet appeared on the history and antiquities of Wales. Until a very recent period, Welsh archæology was almost entirely given over to worthy enthusiasts, blissfully ignorant alike of history and philology; and things were solemnly written about the Bards and about Brutus which can be paralleled for absurdity only from the "literature" of Freemasonry. But the progress, on the one hand, of Celtic philology among German and French scholars, and on the other of mediæval constitutional studies in England among what may in a sense be spoken of as the school of Stubbs, was sure after a time to remedy this state of things. On the philological side, the way has been led by Prof. Rhŷs, the occupant of the one chair of Celtic in a British university. Among those who have followed him, Mr. Gwenogvryn Evans deserves especial mention as having at last supplied us with editions of important Welsh texts which are up to the modern level of critical scholarship. And on the historical side, much has been done by the competent knowledge and sober judgment of Professor Tout, among others, in the series of lives with which he has enriched the Dictionary of National Biography. But no attempt has been made before the present volume to take stock of these new acquisitions; and it is because this does so that it will be indispensable to the Celtic student, and deserves a place in the public library of every American town which numbers any considerable Welsh population among its citizens.

It came into existence in an odd way. It may be remembered that the Liberal Government which took office in 1892 was dependent upon a small and somewhat insecure Parliamentary majority. Under these circumstances, the Radical members returned by Wales, forming, as they did at that time, almost the whole of the representation of the principality, organized themselves for the first time as a distinct Welsh party, and proceeded in season, and (as some other Liberals thought) out of season also, to urge their claims upon the Government, threatening in no obscure terms to withdraw their support if they were not listened to. There had for some time been a vigorous nationalist movement in progress in Wales, taking the forms primarily of an increased interest in the Welsh language and of efforts for the establishment of Welsh colleges; and of late there had arisen an agrarian agitation, following, though indeed *longo intervallo*, the lines of that which had been so successful in Ireland. Accordingly, in 1893, the Liberal Government appointed a Royal Commission on Land in Wales and Monmouthshire, only too happy to be able to do anything quite so easy. Let us add that neither this nor the establishment of a Welsh university satisfied the Welsh party in the House of Commons; that it insisted on the introduction of a bill for the disestablishment of the Church in Wales, and thereby contributed its share towards bringing the Liberal party into the uncomfortable position in which it finds itself at present.

When the Commission reported in August, 1896, the Liberal Government had fallen from power, and the recommendations of the Commissioners received but little attention. Their Report contained learned chapters on Welsh philology and on early land tenure; the former evidently from the pen of Professor Rhŷs, and the latter by Mr. Frederic Seebohm, the distinguished writer on agrarian history, who had joined the Commission with the hope of finding new material for his investigations. It contained also accounts of the ecclesiastical and educational history of Wales during the last two centuries, and of rural life among the Welsh farmers of to-day, which were doubtless contributed by another Commissioner, Mr. Brynmor-Jones, one of the leaders of the Welsh Parliamentary party. There was some force in the criticism that, interesting as this matter was, much of it had no appreciable bearing on the problems immediately before the Commission, and that it would find a more appropriate place in a separate volume. Moreover, in spite of the low prices at which British blue-books are obtainable, a blue-book is the last place in which one would publish anything for which one wanted to secure general attention. Professor Rhŷs and Mr. Brynmor-Jones have seen the force, at any rate, of this latter consideration, and in the present substantial volume they have reprinted the historical and descriptive portion of the Report. But they have taken the opportunity to add to them a series of elaborate dissertations on the Pictish question, on Roman Britain, and on ancient laws and customs, together with three chapters on Welsh history—from Cadwaladr to the Norman Conquest, from 1066 to 1282, and from 1282 to the time of the Stuarts. A good deal more than one-half, therefore, of the 648 pages forming the volume before us is altogether new.

The circumstances of its origin, and its composite authorship, will explain the extreme differences of style between the several parts of the book. The later chapters, on the social conditions of to-day, are plain sailing enough for the ordinary reader, though addressed so completely, if quite unconsciously, to a Welsh audience as to need an occasional word of explanation; as, for instance, in the use of the term "cause" for a dissenting religious society (see pp. 462, 470, 473, 477), to which dictionary-makers will please attend. The earlier chapters, on the other hand, are, if anything, a little too severely scholarly. The "Note to the Reader" ends with the remark that "where the two last syllables of a word have been run into one in the more modern stages of the Welsh language, the word is, of course, a perispomenon." We should like to know to how many readers of ordinary cultivation this statement conveys any information. The two words might not unfairly be regarded as typical: the whole volume oscillates between "cause" and "perispomenon."

In the space at our disposal we cannot attempt to criticise the chapters devoted to the mediæval "political" history of Wales. These 267 pages must be regarded as a quarry wherefrom some future historian who has an eye for the salient points, and knows how to present them, will be able to extract and set forth in pages of one-tenth that number all that any reader except the specialist will ever care to remember. We must content ourselves in this place with some observations, first, on the ethnology of Wales; secondly, on Welsh land tenures; and, thirdly, on the present condition of the country.

As to the ethnology of Wales, our authors assert emphatically what has long been known to be Professor Rhŷs's opinion, and was expressed by him a good many years ago in the short-lived *Princeton Review*, viz., that anthropologically, "on the whole, the Welsh of the present day are not Aryan," though they have learned to speak an Aryan tongue. "The Aryan element forms, as it were, a mere sprinkling among them."

> "If a competent ethnologist were to be sent round Wales to identify the individual men and women who seemed to him to approach what he should consider the Aryan type, his report would probably go to show that he found comparatively few such people, and that these few belonged chiefly to the old families of the land-owning class; the vast majority he would only label as probably not Celtic, not Aryan."

The race history of Wales as here constructed is as follows. The aborigines of Britain were non-Aryan. Until evidence is found to the contrary, it will be "a waste of conjecture" to regard them as belonging to more than one race; and this race is represented probably by the Picts of history. Some time about the sixth century B.C. came the first wave of Celtic migration—that of the Goidels (Gaels)—and overran most of the southern half of England. They probably made slaves of the subjugated population, and in process of time a mixed race came into existence, in which the præ-Aryan blood greatly preponderated, though the aboriginal language had disappeared. Then, in the second century B.C. or thereabouts, arrived the second Celtic swarm, that of the Brythons (the Britons proper); and these conquered from the Goidels most of the country which the latter had conquered previously from the aborigines. Among other districts, they took possession of Mid-Wales, leaving North and South Wales to the Goidels. Finally, soon after the Romans left Britain, a Brythonic chieftain named Cunedda came with a band of followers from the North, where he had apparently been defending the Roman wall, and brought practically the whole of what is now Wales under Brythonic rule; thus creating "the political framework of Wales under the aspect which it presents to the historian of the Norman Conquest." The Goidelic dialect may have survived as late as the seventh century in parts of the country; but though the Brythonic dialect took its place, Brythonic blood was very scantily infused into the people anywhere except in Mid-Wales, and everywhere the aboriginal stock continued to form the bulk of the population. If any indignant Welshman is inclined to take umbrage at these conclusions, he may be consoled by the remark of our author that, "taken in the bulk," the people of France are similarly of non-Aryan descent. And lest the "Anglo-Saxon" should exult, he may be reminded that, according to the same authority, "the average Englishman is at most not much more Aryan than the average Welshman."

The chapter on land tenure was written in "greater part" by Mr. Seebohm, as has been already noticed, and it is republished here with his consent. It would have been convenient if the editors had indicated precisely those portions which were added by other hands; but, as Mr. Seebohm signed the Report as a whole, he may be held to have accepted the entire chapter, and for brevity's sake one may speak of it as his work throughout. It is a contribution of the utmost interest to the economic history of Great Britain. Mr. Seebohm begins by a brief and well-written statement of the conclusions as to "tribal" land tenure prior to the Anglo-Norman conquest, which he has already given to the world, five years ago, in his 'Tribal Community in Wales.' Readers of that book will remember the sharp distinction which Mr. Seebohm there draws between (1) the joint occupation of land by undivided kindreds, the *gwely* or *progenies*, characteristic, as he believes, of the free tribesmen, who are described in thirteenth-century Extents as *libere tenentes* or free-holders; and (2) the *register land* of non-tribesmen, non-Cymry, described in the same documents as *villani* or serfs. That much of the land was held in the thirteenth century by these *gwelys* is evident enough; but neither Mr. Seebohm nor the editor (who in other chapters builds largely on his conclusions) has quite overcome the difficulties which arise when these joint tenancies are sought to be connected with the rules of succession found in the Welsh Codes. Mr. Seebohm speaks of "the ordinary tribesman" as "prospectively and by possibility" succeeding to the headship of a *gwely* (p. 399). But if, as he holds, the *gwely* arose from the operation of a rule according to which no final division of an inheritance took place until the fourth generation, the ordinary tribesman could not succeed to the headship unless he was the great-grandson of a *gwely* founder. It is hard to believe that the very symmetrical *gwelys* and *gavels* revealed by the thirteenth-century documents could have been the result of the operation of such a rule of inheritance working through centuries; it looks much more as if the territorial units had become more or less stereotyped at an early period.

What is more novel and probably more valuable is the account which Mr. Seebohm now goes on to give of the transition from mediæval to modern conditions, a transition effected mainly at the end of the sixteenth century. We do not know whether Mr. Seebohm was expected to give his blessing as a historian to the agrarian movement. Certainly we recall a paper of his on "The Historical Claims of Tenant-Right" which was frequently invoked in the early stages of the Irish farmers' agitation. But Mr. Seebohm gives no such countenance to like demands in the case of Wales:

> "The present year-to-year tenants of Wales cannot claim to be the direct descendants of the ancient Welsh free tribesmen. The successors in title of these are still paying their ancient and now trifling quitrents. That more of them have not survived is owing to natural causes, and, perhaps more than all, to their having enjoyed for centuries, like English copyholders, the right of selling their holdings in the open market. On the other hand, if some of the present year-to-year tenants are the successors of the ancient non-tribesmen or *nativi* (serfs), then the most probable general conclusion seems to be that their ancestors have passed through various vicissitudes, out of which, through stages of leases for lives or years (which for some reason were not renewed), they have passed into the position of year-to-year tenants" (p. 437).

It might be made an historical grievance that the descendants of the early serf population did not succeed in obtaining complete security of tenure in the shape of long leases renewable on the payment of moderate "fines." But Mr. Seebohm makes no such suggestion, apparently because year-to-year tenancy has practically meant permanence. The actual result has been one which a whole school of social politicians is wont to regard as the most desirable, the retention of the "peasantry" upon the land.

> "Many causes have combined in producing and afterwards perpetuating what is the marked and peculiar feature of rural economy in Wales, viz., the prevalence of a large number of small separate farms of what may be described as the peasant and family type. So that, on the one hand, the year-to-year tenancy in Wales has not become generally associated as in England with the system of large farms of the more commercial type, nor, on the other hand, has it been associated, as in Ireland and the crofter districts of Scotland, with that excessive subdivision and subletting which leads to the congestion of the rural population upon holdings too small to maintain the occupiers."

We should like to know to what Mr. Seebohm would attribute the difference especially as between Wales and Ireland. As between Wales and England, the explanation is to be found, we imagine, chiefly in the character of the soil and climate, which render tillage-farming on a large scale impracticable. And it may be remarked in passing that the value of this volume would have been greatly enhanced if its authors had given us more information about the physical features of the country so far as they affect farming. There is probably no institution in Great Britain in which agrarian conditions are studied from the point of view of the economist, as they are in half-a-dozen German universities; and the result is that, in a book like this, there is an almost complete dearth of that information which any serious student of the rural economy of Wales should certainly first ask for.

The chapters which come at the end of the book and sketch the present position of affairs, will be of moving interest to Welshmen who have left their native land, and will in some measure enable the non-Welshman to understand the singularly instructive problem of Welsh nationalism. The limitations of the Commissioners' original task justified the omission from their Report of any account of the large industrial and mining population growing up in the North and the South, especially around Cardiff and Swansea. But the omission from this volume is evidently significant: it is in the farming population that the spirit of nationality survives most vigorously, and it is commercial and industrial influences which most endanger it. The Welsh language is spoken by about a million people, and half a million know no other tongue. It is even gaining ground as a second speech, for it is becoming as fashionable as a few years ago it was unfashionable for the landowning gentry to have their children taught Welsh. This, as our authors remark, cannot but tend to greater sympathy between social classes. A serious disadvantage which has hitherto followed from the ignorance of English on the part of half a million of the people is, that they have remained in large measure unaware of the benefits secured for them by English legislation.

> "The most prevalent instance under this head was the ignorance, well-nigh universal in some districts, as to the provisions of the Agricultural Holdings Act, and the Ground Game Act. Almost all the tenant farmers in the Welsh-speaking districts believed that these acts . . . could be totally excluded by means of the contracting out clause. . . . In most districts the act of 1883 was for all practical purposes a dead letter."

But these "ameliorative provisions," as our authors call them, "have of recent years altered in a considerable degree the relationship of landlord and tenants"; and we are perhaps not far wrong when we conjecture that, if they had been generally known, the agrarian agitation in Wales would never have been serious enough to attract the attention of Parliament. The difficulty can, of course, be overcome by the adoption of the common-sense and inexpensive practice of issuing from the Government Printing-Office Welsh versions of all documents likely to be of interest to any considerable number of the people. This is what every little nationality in the civilized world properly insists on—from the French of Quebec to the Flemings of Belgium.

One last observation. The sense of irritation, undoubtedly felt more keenly by the Welsh peasant of late years, must be regarded—so our authors' statements seem to indicate—not as the result of greater physical distress, for the standard of living is everywhere slowly rising, but as the result of the growth of what is commonly called democratic sentiment. The people will not be patronized by the gentry any more; and, with the barrier, not only of language, but also of religion, between churchgoing landlord and chapelgoing tenant, it is natural enough that offence should often be taken where none is intended. Wales has of late years been provided with an excellent system of secondary and collegiate education; and this, together with the further development of industry and trade, may be expected to soften in time some of the sharp lines of social classification. The gentry, if they are to maintain their influence, must learn, as their brethren in England are learning, to act as leaders of the people through the new democratic organization of local government, rather than as rulers. And perhaps it is not past praying for that even the Anglican clergy in Wales may acquire some of that power of acting with people, instead of for them, which their fellows have learned in their work in the great cities of England.

A Critical History of the Doctrine of a Future Life in Israel, in Judaism, and in Christianity; or Hebrew, Jewish, and Christian Eschatology from Pre-Prophetic Times to the Close of the New Testament Canon. Being the Jowett Lectures for 1898-99. By R. H. Charles, D.D., Professor of Biblical Greek, Trinity College, Dublin. London: Adam & Charles Black; New York: Macmillan. 1899. Pp. x+428.

This book is an expansion of the article on Eschatology which will appear in the next volume of Cheyne's 'Encyclopædia Biblica,' and, in part, of the article on the Eschatology of the Jewish Apocryphal and Apocalyptic literature which has already appeared in the Hastings Bible Dictionary. The title, if lengthy, gives a fair idea of what is attempted in the book; the accomplished fact must be confessed to be somewhat sketchy and unsatisfactory. In the space assigned, hardly anything else would be possible, and, also, while Professor Charles is an acknowledged authority of the first rank in Jewish Apocrypha and Apocalypses, his insight is less keen and his touch less certain in dealing with the Old and New Testaments.

The plan of the book is undoubtedly excellent. The stress lies throughout on development and the historical context. The tangled threads are picked out patiently and skilfully. The merging into one of varying ideas, and the separating again of that unity into variety—the movement of the Hegelian dialectic—is traced conscientiously. It is the whole development, too, which we have here; there is no gap from Malachi to Matthew. Prophecy passes into Apocalyptic, and from the soil of Apocalyptic spring the ideas of Christianity filled with its new moral and spiritual life. Why a sketch of primitive Greek eschatology, in which Rohde's 'Psyche' is mostly followed, should be introduced, is not so evident. It is interesting in its parallelism with the older Hebrew ideas, but so far as direct influence is concerned, sketches of the Mazdean, the Egyptian, and the Greek philosophical systems would have been equally in place. The grounds for this inclusion suggested on p. 136 are hardly adequate.

It is impossible in our space to trace in any detail Professor Charles's view of the development. It is "critical"—a word fast becoming almost as beatific as Mesopotamia; which means that it is an honest attempt to get down to the fundamental facts and to state them objectively. The question is not put, Are such and such views correct? but, Are these the views once held as correct? Professor Charles himself is a close follower of Professor Cheyne, though the vacillations—or rapid advances, as you choose—of his guide sometimes land him in painful uncertainty between Philip drunk and Philip sober. Yet he lays stress more than once on the provisional character of many of the results of Old Testament criticism, and in that he is wise. His statements of the varying views of different scholars show how much is still to be done, and his own statements are commendably free from that dogmatism which too often exalts the chance idea of the moment into the perfect chrysolite of fact. The starting-point is the Exodus, and an outline is given of the primitive conception of God and the development of that conception. As is rightly pointed out, such a basis is essential for the eschatological ideas proper; that Yahwé's lordship did not at first extend over Sheol, conditioned all the after development. For centuries the ideas of the people of Israel were drawn from pure Semitic heathenism, and the revealed religion of Yahwé—Professor Charles is emphatic that Yahwism was not a mere natural development—had little effect on them. They were due to ancestor worship; and even after the long conflict with true Yahwism was long over, they lingered in stray details till the final destruction of Jerusalem. Thus we have the one thread, the more or less active future of the individual in Sheol. This was gradually destroyed by Yahwism, which first reduced the existence in Sheol to a mere subsistence, and then began to develop its own doctrine of an individual future through the consciousness of an immediate communion with God. The other main thread was the conception of the immortality of the nation in the Messianic kingdom. The synthesis of the hopes of the individual and of the nation resulted, in the third century B. C., in the doctrine of the resurrection. In the first century B. C., the hope of an eternal Messianic kingdom was abandoned and only an extreme individualism was left. But in Christianity a new synthesis appears—this time of the individual and the race, not of the individual and the nation.

Such, in short, is the development. Special attention may be drawn to the two views of Sheol, heathen and Yahwistic—a fruitful distinction. With this go the varying conceptions of body, soul, and spirit in trichotomy and in dichotomy. Further, to the influence, or rather non-influence, of Greek religious ideas, and the isolated influence of Mazdeism. Professor Charles speaks weightily on both these points. As he traces it, the uniqueness of the religious development in Israel and of the final synthesis and culmination in Christianity stands out with force and clearness. On p 214 there is an interesting note on the Messianic meaning of the phrase "Son of Man" in Ethiopic. The treatment of the New Testament circle of ideas is unfortunately very slight, yet the four stages of Paul's development are firmly outlined.

Criticism of the book must either be very incisive or can apply only to details. To many, the impersonal attitude of the writer will be a stumbling-block. He tells what this book says and what that prophet taught, but not what is Catholic truth. This applies even to the words of Jesus; on p. 331 we are told that an expectation of his was falsified. Yet through it all there plays illusively a recognition by Professor Charles of a special revelation, and our question might come to be, Of what? The book is "a critical history," but the attitude will worry the plain man.

For the criticism of details, we have little space left. On pp. 56 and 155 the term "translation" is applied rather bluntly to the vanishing from human ken of Enoch and Elijah. We use that word with a connotation of theological ideas; what ideas did the Hebrews connect with those two events? Especially if we say that Enoch and Elijah were "translated to heaven," we are going too far. Enoch "was not to be found; for God took him"; Elijah was carried up into the sky—that is all we are told, and all the Hebrews were told. What did they think when they heard or read those things? That is the problem. Again, there may have been a well-defined doctrine of immortality in Job's day; it would not have availed a whit to have solved his problem. He would still have flung the causeless deaths of his children, his own unmerited sufferings, and all the misery of the world in the face of the Almighty; such things, no happiness to come could have blotted out. Or, rather, till the mystery of pain was solved, he could have no happiness here or there. What he demanded was an answer to that question and a vindication of his own innocence. Again, to say that the writer of Ecclesiastes "fell back on unbelief and materialism" (p. 72), is too general an expression. He is an absolute, if we cannot say a devout, theist throughout. On p. 73 it might have been worth while to mention that Wellhausen also does not recognize any allusion to a doctrine of immortality in Psalms xlix. and lxxiii. As a final and infinitesimal detail, we note the most curious use on pp. 162 and 204 of "tory" in the sense "conservative." "The still orthodox and tory view found in the Old Testament," reads very queerly indeed.

We look some time for a very much better book on this subject from Professor Charles; he may even in the future be disposed to think that he has published too hastily. But we receive the first-fruits with gratitude, both for its own sake and as an earnest of what is to come.

History of Enfield, Conn., 1679-1850. By Francis Olcott Allen. Vol. I. Philadelphia: The Author. 1900.

If an "apology" were needed for compiling a local history, the fact that three large volumes could be evolved from the annals of one Connecticut town would be sufficient justification. Mr. Allen's 'History of Enfield,' now in process of publication, is a labor of love and of grateful remembrance for the home and State of his ancestors. He has successfully pursued a high ideal—"a complete transcript of all its [Enfield's] official data which would be studied by succeeding generations with increasing veneration for the Founders." These data comprise attested copies of the "Acts and Grants of the Enfield Proprietors' Committee," of land surveys and lay-outs, of town acts and votes from 1693 to 1850. This exhaustive copying is more valuable from the very imperfect character of many of the early entries, making them practically inaccessible to the ordinary reader. Enfield is fortunate in having an absent son with taste, time, and means for such a laborious and costly outlay.

This remarkable array of contemporaneous record is happily prefaced by a general "Historical Sketch of the Town of Enfield," prepared in 1829 by another of its loyal sons, John Chauncey Pease, M.D., enabling us to view the town in progressive stages of development, and from the standpoint of a past generation. The summary of conditions at the close of the town's first century is especially valuable for comparing past and present. Mr. Allen's preference for a "complete transcript of official data," in place of treating salient features in the town's history, limits the reader to literal facts; yet these bare records give ample proof of the poverty of the age and the difficulties attending settlement and expansion. A spirit of neighborly accommodation was early manifested: "Y^{e} Committee laboring y^{e} best they can to sute and accomadate those that first appeare to settle there, And when a man lys bad in y^{e} first field to indeavor to mend him in y^{e} Next." So, also, in excusing settlers from fencing in "all their house lot, which will be hard at first beginning and may be a while indulged." Town meetings for a time were much occupied with devising laws for the collection and protection of turpentine, persons presuming "to gitt it upon any pretense whatsoever to be warned out of town," and if persisting in trespass, "the selectmen to size al this tirpetine so goten for the yous of the town." The perverse ingenuity of the Enfield spelling was remarkable even for those days. Land was reserved for school as well as for ministerial purposes, but no schoolmaster was hired till 1707.

Enfield was settled by emigrants from Massachusetts, and was held by that province till 1749. Dr. Pease characterizes its "secession" as "very remarkable" and "not sufficiently explained"; but dissatisfaction with existing conditions was shown at an early date. The town twice, at least, "by a close voat, doe yeld themselves to be under conettecoat thir government," and ordered "a list of y^{r} Estates" to be given "to harford cort." Its loyalty to Massachusetts was manifested, however, by prompt obedience to military requisition, Enfield sending a large band of young men upon the Cape Breton expedition of 1745, of whom nineteen perished from disease and exposure.

The remaining volumes of this exhaustive history will comprise records of deeds, churches, probate courts, births, marriages, deaths, graveyard inscriptions, etc., etc. They will doubtless include sketches of Enfield's unique Shaker settlement, and of the development of its large manufacturing interests, and of all that is needful for a "complete transcript" of a town which has evoked such a monument of loyal devotion.

Familiar Fish: Their Habits and Capture. By Eugene McCarthy. New York: Appletons.

A few weeks' preliminary angling might be supposed to be the best preparation for reviewing the book before us; but game fish, with all their fixity of general characteristics, are yet so prone to idiosyncrasy in detail that one can scarcely read a paragraph about them without recalling a half-dozen exceptions to any assertion which may be made. To avoid endless discussion, then, one may simply say that Mr. McCarthy is evidently well acquainted with the kinds of fish that he describes, and what he has to say as to their habits and capture will hold good whenever the particular fish you are after does not take it into his head to introduce variations. The book has many good suggestions for the beginner, but something on the line of 'The Compleat Angler,' 'Little Rivers,' or 'Fisherman's Luck' will be a better companion to one who has already made some progress in the angler's art. The author places the leaping ouananiche clearly in the lead as a fighter, assigning, however, a good second to the black bass, which the enthusiastic Dr. Henshall pronounces "inch for inch and pound for pound the gamest fish that swims." On the much-argued question as to the relative gameness of the small-mouthed and large-mouthed black bass, he puts himself on the side of the former, but the present writer has a very distinct recollection that the two hardest-fighting bass ever brought into his net, initial strength and endurance both considered, were large-mouthed, weighing respectively three and a quarter and three and a half pounds. Perhaps it may be taken as established, however, that in point of endurance the small-mouthed generally excels. The lead which it sometimes seems to possess in agility may be largely explained by the fact that it fights nearer the surface. With very few exceptions it will leap from the water at least once before it is brought to net, while the large-mouthed variety sticks to the bottom almost as regularly as the pike, and, of course, the more line one has under water, the more will his perception of the movements of the fish be blunted.

The manuscript of Mr. McCarthy's work passed through the hands of President Jordan of Leland Stanford University, which is, of course, an acceptable guarantee of its accuracy on the scientific side. We should like to ask, however, whether it is true that the muskallonge is found in the upper Ohio valley, as asserted on page 146. The opinion (page 148) that, with the triple hook usually attached to the trolling-spoon, the fish is more apt to strike one hook and knock all aside than would be the case with a double hook, seems hardly reasonable. We should prefer to see the triple hook opposed, if at all, in the interest of the fish rather than the angler. And as for the gang of ten hooks, described and recommended on page 149, neither the law nor the ethics of sportsmanship should give it any quarter whatever.

The book which the average angler wants, a reliable source of information on the modern technique of the art, and a delightful companion for the dozy hour as well, is yet to be written.

BOOKS OF THE WEEK.

Back Numbers of the Nation.

In response to frequent inquiries from subscribers:

An incomplete set of THE NATION has little or no market value. Partial sets, bound and unbound, are always obtainable (usually lacking the earliest volumes), and do not command high rates. The bindings generally count for nothing, owing to great diversity of styles. Volume I. has readily brought $10 and upward when complete, bound or unbound, but will bring very little in proportion if a single number is missing. Volumes II. and III. are also scarce, but not so high-priced as the first.

Complete sets, both bound and unbound, have sold for $100, with tolerably quick bidders, and have an increasing value year by year.

Single numbers not more than a year old can usually be supplied by the publishers at 10 cents each. For numbers more than a year old purchasers are referred to Mr. J. W. Christopher, 47 Dey St., Mr. A. S. Clark, 174 Fulton St., or H. Williams, 25 East Tenth St., New York.

The publishers no longer undertake to buy or sell numbers or volumes more than a year old, and can only recommend sellers or purchasers to negotiate with a dealer or to advertise in THE NATION.

[Publication was begun July 1, 1865, Vol. I. comprising the last half year. Two volumes per year have since been issued, Vol. LXX. comprising the first half year of 1900.]

The Most Charming Love Story of the Year

Is now in its TWENTY-SECOND Thousand.

The Nation.

NEW YORK, THURSDAY, SEPTEMBER 20, 1900.

The Week.

There is no end of noble sentiments in the instructions of the President to the Philippines Commission last April which Mr. McKinley, still on the defensive, deems this the proper time in the campaign to make public. The casual reader who should glance hastily through the columns which it occupies, might be inclined to think that the policy laid down seemed very liberal to the natives. The substitution of civil for military government is what everybody desires, and here apparently is the promise of it, but a careful examination shows that it is only in appearance that any radical change is made. The supreme control is really retained in the military government. Take, for example, those "inviolable rules" which the President says "must be imposed upon every division and branch of the government," and which are copied from the Bill of Rights of the Federal Constitution—as that no person shall be deprived of life, liberty, or property without due process of law, and that there shall be a speedy and public trial of offenders. It was only a few days ago that the dispatches from Manila reported the arrest, imprisonment, and release of a leading Filipino without the observance of any one of these inviolable rules. The truth is, that the government of the Philippines under the Taft Commission is practically as arbitrary as it was before the members of that Commission left the United States.

On minor matters, we observe more adroitness than principle in Mr. Bryan's letter of acceptance. He outbids McKinley in the matter of pensions, saying that

> "The pension laws should be construed according to the generous spirit which prompted their passage. The platform very properly reiterates the position taken in 1896, that the fact of enlistment shall be deemed conclusive evidence that the soldier was sound when the Government accepted him. A certificate given now to the health of a person forty years ago, even if easily obtainable, should not have as much weight as the certificate of the medical officer who examined the volunteer with a view of ascertaining his fitness for army service."

One of the things to be put to the credit of McKinley is that he kept in office a Commissioner of Pensions who construed the laws according to the facts before him, and not according to the "generous spirit which prompted their passage," if anybody knows what that was. On the subject of the Nicaraguan Canal, Mr. Bryan goes much beyond the present Administration in the way of disregarding the rights of other Powers interested in the navigation of an Isthmian waterway, and he especially condemns the Hay-Pauncefote treaty because it seeks to conform to existing international obligations. This is not the language of statesmanship, but rather that of a candidate who is not very particular what he says if it will bring him the support of unthinking voters.

Gov. Roosevelt's letter of acceptance comes out strong on the savagery and general "cussedness" of the Filipinos. It is really a painful thing to see an educated man, of gallant and generous impulses, thus take up a railing accusation against people concerning whom he has no first-hand information. He freely compares them to Apaches and the Boxers. He indulges, in fact, in just such sweeping revilings of an enemy as would fall naturally from the lips of an Apache or Boxer. But they are out of place in the mouth of a brave soldier. Gov. Roosevelt has been studying seventeenth-century literature. He ought to remember Selden's rebuke of braggart soldiers who abuse an enemy. The worst of it is that the Governor sets up his own unsupported authority against the men who do know the Filipinos. He is wiser than Dewey and the other naval officers; than Foreman and Worcester and Schurman.

The New York State campaign has opened in the lifeless way which was to have been expected after such a convention as the Democrats held last week. The minority party might have made it one of the most interesting and exciting canvasses for the Governorship which New York has seen in many years, if it had nominated the candidate whom the majority frankly admitted that they dreaded. But when Croker "turned down" Coler and imposed a Tammany ticket upon the Convention, the heart was taken out of the Democratic campaign. Mr. Stanchfield, Croker's choice for the Governorship, betrayed his own sense of the weakness of his candidacy when he devoted his opening speech to the Trusts, and neglected State issues entirely. Meanwhile there is a notable lack of enthusiasm on the other side Mr. Odell is very popular with the professional politicians of his party, but he is not a man to stir the masses if he were to take the stump, and he will not. The Republicans have the issue made for them by the attempt of Croker to control the government of the State as well as that of the municipality, and it is hard to suppose that the Tammany boss has not given them an easy victory after a dull campaign.

Mr. Stanchfield's address at Lyons on Friday (his first appearance since his nomination) will not commend him to voters who do their own thinking. It was wholly devoted to Trusts, department stores, and other combinations of capital. The usual picture of the evils that beset these combinations was presented to the audience, but no remedy was proposed, except for those which are protected by the tariff. Certainly, department stores are not of this class, nor is the Bicycle Trust or the Tanning Trust, which were particularly mentioned. He was easily answered by Mr. Woodruff, who followed him, and who denounced Trusts as volubly as Mr. Stanchfield himself, and who brought forward the Tammany Ice Trust as a familiar *tu quoque*. There may be a certain amount of prejudice in the minds of the agricultural class whom Mr. Stanchfield was addressing, available for campaign purposes; but unless it can be shown that the Democratic party has a remedy for Trusts and department stores which can be put in force by legislation, no man of sense will cast his vote for a Democrat rather than for a Republican on account of them. All talk about the virtues of competition is idle unless you show how to bring it about. The only remedy for Trusts that Mr. Bryan has committed himself to is a law providing that no corporation doing business in any State shall do business in any other State unless it receive a license from the Federal Government, and that this Federal license shall be issued only on condition that the corporation is not a monopoly. This may be considered the Democratic plan of dealing with Trusts, but even this would not reach the department stores. Mr. Stanchfield's speech at the Wayne County Fair was mainly claptrap and not of a very good kind. It is on a par, however, with the "full dinner-pail" that figures so largely in the Republican campaign.

It is an interesting and significant fact that the Republican Congressman in Maine who made the best showing in the race for reëlection, was the one who opposed Imperialism so stoutly in the House of Representatives during the last session. Mr. Littlefield, the new member from the Lewiston district, who has leaped into national prominence by his bold displays of independence at Washington, received a merited reward from his constituents in running ahead of his party's ticket. Moreover, he was easily the most effective orator on the Republican side during the campaign, while the party also profited much from the speeches of Representative McCall of Massachusetts, who led the movement against the Porto Rican tariff, and Senator Hale of Maine, who has opposed the whole

Expansion movement ever since he voted against the treaty of peace and was defeated by Bryan's successful efforts to secure its ratification. The fact that Hale, McCall, and Littlefield were still supporting the Republican party, helped it more than all that was said by the whole company of Expansion orators who went up and down the State.

The cry for the initiative and referendum has been raised again this year, and there seem still to be a good many people who believe that a large part of our ills could be cured by their introduction. The advocates of the change, however, always fail to explain why they should expect voters to take an earnest interest in the referendum as a regular thing when they pay very little attention to the institution as a special thing. At the recent election in Maine, there was submitted an amendment to the Constitution establishing the office of State Auditor. There had been considerable discussion of the question, and a good deal of opposition in the farming towns, because it was feared that another expensive department would be saddled upon the State, to do the work which the Governor's council is employed to do in auditing State bills. The proposition was defeated, but the significant thing is that very little attention was paid to the matter. Penobscot County is probably a fair illustration; out of 15,000 men who voted for Governor, only 3,536 had interest enough in the auditing question to mark their ballots either way. If the average man will not improve the opportunity of the referendum when it comes rarely, it is difficult to see why he should be expected to bother himself about the matter when a host of questions are submitted to him.

Delaware, which went for McKinley in 1896, has been generally thought likely to go for Bryan this year. The Republican party has been split into two factions—the Unionists, controlled by Addicks, and the Regulars, who have been fighting the gas speculator for years. Each faction has nominated a State ticket of its own, and the leaders of the Regulars have been inclined to make no concessions, but their State Committee met on Friday and agreed upon a compromise ticket which seems likely to be accepted by the Unionists. In 1896 McKinley carried Delaware by nearly 4,000 plurality, and when the two Republican factions united on a candidate for Congress in 1898, they elected him by about 2,500 plurality. Two Senatorships are to be disposed of by the Legislature which will be elected this fall, and Addicks is bent upon getting one of them. If he can come to terms with the Regulars, and all hands will then support the State and national tickets, McKinley should stand the better chance of carrying the State. Addicks has a double motive for putting out his money this year, since he not only has the chance of buying a Senatorship, but also needs to carry the State for the Republicans on the Presidential issue to justify the action of the National Convention in "recognizing" him at Philadelphia.

Gov. Roosevelt on Thursday made public his decision dismissing the charges brought against District Attorney Gardiner, and thus retaining Mr. Gardiner in office. The accusations made numbered no fewer than eighty, and the specifications rose to about 2,000. It was inevitable that a great amount of time should be consumed in the hearing, if it had been pressed with all diligence and no unexpected causes of delay had arisen. As it was, one thing after another occurred to drag the case along, with the result of cooling public interest in the matter. The selection of a Commissioner to hear the charges, too, was not happy. Mr. Wilcox not only refrained from expressing any opinion as to whether the evidence justified removal, but virtually acquitted the District Attorney on every count, so far as any serious misconduct was concerned, in many cases dividing the responsibility between him and the judges. Gov. Roosevelt would have made a grave error if he had not dismissed the charges upon the Commissioner's findings. Yet the attempt to secure Mr. Gardiner's removal is entirely justified by the evidence of his misconduct which has been brought out. On the other hand, Gov. Roosevelt must have been glad to avoid displacing a political opponent, since his motives might easily be misrepresented. The incident shows the inherent weakness of the law invoked against Gardiner.

President Mitchell and Organizer James of the United Mine Workers are active in their efforts to force out the men who are operating the Jeddo collieries. These men have an agreement of long standing with their employers, according to which all differences are submitted to arbitration. The men have made certain demands, and have given their employers ten days for consideration. At the end of this period, according to the standing agreement, any matters which have not been satisfactorily settled are to be submitted to a board of arbitration, made up of two arbitrators, one chosen by the men, one by the employers, and a third chosen by these two in case they themselves fail to agree. The officers of the United Mine Workers fear that these men, by continuing to operate their collieries, may break the force of the strike, and the Association is eager to get them out. In doing this the United Mine Workers are giving another instance of that irresponsibility and disregard of contract agreements with employers which has brought trade-unionism and labor organizations into general disfavor all over the country. The Jeddo men are working under an agreement to settle all differences through arbitration, and this is exactly the sort of agreement which the Mine Workers' Association is urging upon all the operators. It is the cardinal principle upon which the miners have insisted in organizing the present strike. But if an agreement of this sort with employers is to be followed only when it pleases the miners to follow it, and disregarded when they choose to disregard it, operators generally are not likely to accept the principle of arbitration on those terms.

In view of the coal strike here, it is interesting to note the condition of the coal-mining industry in England during the last year and a half. In sharp contrast to other industries, the coal trade during this period has been in a very flourishing condition, and the colliery companies have been taking profits and declaring dividends freely. One company, with a capital of a million pounds, wisely distributed only 20 per cent. on the ordinary share capital, placing £100,000 to reserve fund and devoting about £20,000 to other purposes, while keeping in hand undivided profits amounting to £25,246. Another company reports that its profits for the year ending March 31 amounted to £111,498, by far the largest ever earned by the company in any one year, the next largest being £74,765 in the year ended March 31, 1894. Other coal companies report equally great profits. These ample dividends have in some instances occasioned a rise of 150 per cent. or more in the capital value of collieries. There is every evidence in the present situation that this long-continued heavy profit-taking on the part of the mine-owners has become an embarrassing tax upon British industry. The operators themselves realize that they are enjoying abnormal prosperity, but they are naturally indisposed to forego profits by lowering the price of coal gratuitously.

In putting up the price of coal as high as the market allows, the mine-owners have acted in accordance with a well-recognized business principle. It does not appear at all that they have manipulated prices, or attempted to "bull the market." No charges of this sort are brought against them. They have not even limited their output in order to sustain prices. On the contrary, it appears that the collieries have been working to their fullest capacity, and not the least perplexing feature of the situation is found in the fact that at the present high prices—prices considered to be ruinously high for British industry—the coal-mine operators have been literally swamped with orders which they have been unable to fill. Manufacturers have found themselves caught as in a vise between the rising prices of coal at home and the downward pressure of foreign competition in the markets where they must dispose of their commodities. They have felt generally a narrowing of the margin of profits in consequence of this double movement, and the iron and steel men particularly have been experiencing pretty keenly of late the pressure of American competition. In American markets the price of pig-iron and of steel billets has been and is still steadily declining. At the same time stocks on hand in American warehouses have been increasing, and American producers have been watching European markets eagerly, ready to take advantage of any price movements which should enable them to dispose of their superabundant supplies abroad.

The Supreme Court of Massachusetts has handed down an interesting decision in a case arising out of the struggle for supremacy of two labor unions of the same craft. One union undertook to boycott the other by serving notice upon the "bosses," through its official agents, that members of the rival organization were non-union men. This was understood to be a covert threat that the union serving the notice would order a strike against bosses who should continue to employ members of the other union. The Court enjoins such action, which it characterizes as "intolerable and inconsistent with the spirit of our laws," "malicious," "unlawful," and a "conspiracy." But there is a radical difference of opinion among the judges. Chief Justice Holmes stoutly dissents from his brethren on the bench, and declares that, in his opinion, laborers may lawfully employ such means to secure the unity of organization which is necessary to make the contest of labor effectual. He believes it lawful for a body of workmen "to try by combination to get more than they are now getting, although they do it at the expense of their fellows, and to that end to strengthen their union by the boycott and the strike."

Galveston was a city of some 40,000 inhabitants built on an island something like the sand spits that skirt the Great South Bay of Long Island. The land on which it is situated is from five to ten feet above tide level. It is exposed to the full force of the winds and waters of the Gulf of Mexico. Being near the mainland, it is liable to be submerged whenever a wind of great strength and duration banks up the waters against the coast. The city had been assailed by such dangers before, and it was supposed that the worst that could happen by reason of its exposed situation had already happened. This, it seems, was an erroneous conclusion. The storm of September 8 proved to be a West India hurricane of the most appalling description. The force of the wind appears to have been greater than that which devastated Porto Rico last year. It swept the waters of the Gulf westward and piled them up against the coast. It submerged the foundations of the city to the depth of ten feet in many places. It filled all the wells and cisterns with salt water, and saturated the ground itself with salt. The wind blew down houses and filled the air with their débris, killing and wounding men, women, and children who had escaped drowning. It is impossible to picture the calamity in its awful dimensions. It is needless to say that a great part of the means and implements by which the inhabitants gained their bread have been swept away. The warehouses, the shipping, the churches, schools, and hospitals, the goods, the animals, the railroads (in part), the clothing and utensils are gone, and must be replaced. What had been accumulated by the toil and foresight of half a century for man's comfort and necessities has been engulfed by the waters or shattered by the winds.

The returns from the Cuban elections thus far received show that eleven Nationalists, eleven Republicans, and only one representative of the Democratic Union, the party of annexation, have obtained seats in the coming Constitutional Convention. The list of names includes those of some very able men, among others that of Diego Tamayo, one of Gen. Wood's cabinet, and makes it certain that the protestants against the McKinley plan of having the Convention settle the island's relations to the United States will be well represented, if not in control of the new body. The presence of Gen. Ruis Rivera and of the fire-eating Gen. José Aleman will insure some plain speaking, and as a whole the selections will strengthen the widespread expectation of the Americans in Havana that the Convention will fail to do McKinley's will. That the protests against the unheard-of requirement that a Constitutional Convention shall settle the most important foreign relations of the Government which it is called upon to create, are steadily increasing, is made plain by every mail from Cuba. These protests, as well as the orderly elections, are striking testimony to the ability of the Cubans to govern themselves. The friends of free and independent Cuba might well begin to despair if its people calmly submitted to the "recommendations" of the Military Governor, even though these recommendations are made by a major-general commanding the only troops in the island, and therefore smack of despotism.

Negotiations, now formally concluded, for the placing of a $20,000,000 loan of the German Government in New York, again direct attention to the extraordinary change in this country's position in the world's finance. The floating of these obligations, which appear to be similar in character and maturity to the recent Exchequer bond issue of Great Britain, follows similar accommodation extended to or applied for by Russia, Sweden, and England, and creates a wholly new factor in our investment markets. It must be kept carefully in mind, however, that as yet nothing in the nature of a general movement of small investors to put their money into European Government bonds has developed. Securities of the kind, already floated in our money markets, are not bought and sold on the Stock Exchange. There is, as yet, in Wall Street's phraseology, no "open market" for them. Up to the present time, such European Government bonds as have been placed in the New York market have either been taken by banking-houses, to be disposed of later in the most profitable quarter, or have found their way into the investment fund of the large insurance companies. Even the savings banks, which are among the largest buyers of United States national and municipal bonds, are unable under the law to include foreign securities in their assets. Large, therefore, as is the sum of capital already invested or pledged to these European loans—the total to date, including this German issue, not falling much below $70,000,000—it cannot be said that it represents as yet a permanent change in the general investment movement. But the entering of a new field by the large investing corporations is usually an initial step towards distributing similar securities among private hands. It is, therefore, not at all unlikely that before many months the obligations of European states will be bought and sold on American stock exchanges, held in the strong-boxes of small American investors, and quoted daily in the stock lists of the newspapers.

President Loubet of France, as arbitrator of the boundary dispute between the republics of Colombia, Costa Rica, and Nicaragua, has rendered a decision which has an interest for this country. In lieu of Colombia's extreme claim to the entire eastern coast line of the two northern republics, she gains by the arbitration a scant hundred miles on the east coast and nothing on the west. This rearrangement straightens the Colombia-Costa Rica line, which now runs nearly north and south along the Cordillera as a natural boundary. The decision assures to Nicaragua Greytown, the proposed eastern terminus of the Nicaragua interoceanic canal. If it had been turned over to Colombia, which is interested already in the Panama concession, the Nicaragua scheme might have been blocked.

THE PRESIDENT'S PHILIPPINE NOVELTIES.

Mr. McKinley's letter of acceptance brings things new and old out of his treasure, like the householder of Scripture. Some of his new controversial weapons he uses, however, with surprising carelessness. In slashing at his opponents he makes ribbons of his own previous arguments. For example, he now prints a hitherto suppressed dispatch of Dewey's, dated July 25, 1898, and saying, "Merritt's most difficult problem will be how to deal with the insurgents under Aguinaldo, who have become aggressive and even threatening toward our army." "See there," cries the grieved and indignant President, "the insurgents wanted to fight us even before the peace protocol was signed!"

If one could cross-examine this immune witness, many pertinent questions would be asked. Why publish this one of Dewey's dispatches, and keep the rest under lock and key? Why, if Mr. McKinley was thus warned of trouble, did he not take measures to prevent it? Why did he go out West, lay his hand on his heart, and declare that he "never dreamed" the insurgents would attack us? The truth is, that the President, in his eagerness to make a point against the Filipinos, has forgotten the rôle he had before tried to play. This was that of a big-hearted, unsuspecting father of his people, bent only on blessing the islanders. The idea never entered his head that anybody could attack so good a man as he. So he was correspondingly thunder-struck when the ungrateful dastards assaulted their benefactor. But now he drops this simple-minded, grandfatherly mask, and tells us he was from the first warned of Filipino machinations. "I knew from the beginning that they were treacherous," he protests, not seeing that, in the act, he makes himself out a negligent and napping commander-in-chief.

But the whole thing is a pure Presidential afterthought. Mark how plain a tale shall put down this belated invention. Gen. Merritt's problem was to deal with the insurgents, was it? They were spoiling for a fight even in July, were they? Well, what did Merritt himself say to the Paris Commissioners in October? He was specifically asked if the Filipinos were disposed to make trouble, and roundly replied, "I think there is no danger of conflict." And Senator Frye has publicly declared on this very subject, "Nobody dreamed of any trouble when we were in Paris. Gen. Whittier and Gen. Merritt were before our committee, and testified that the *most cordial feeling* existed between the Tagalos and the United States troops." This leaves the author of the letter of acceptance looking very like a detected manipulator of the evidence.

Mr. McKinley, however, has another argument in reserve just as good. What put an end to the "cordial feeling"? Certainly it was not the peace treaty, the President asserts. Those who maintain that it was have "forgotten," he declares triumphantly, that "before the treaty was ratified . . . the insurgents attacked the American army." Yes, but possibly other things have also been forgotten The President may have forgotten that he, before the treaty was ratified (six weeks before), issued a proclamation to the Filipinos asserting that the cession of the islands was complete, and that our military government would be extended to "the whole" of Philippine territory. He may have forgotten that this proclamation was a gross violation of the Constitution, void both in morals and in law. He may have forgotten that, irrespective of the legal aspect of the proclamation, it was drawn in such an excess of wantonly tyrannical language that Gen. Otis was alarmed, and tried to suppress it, fearing that its publication would drive the Filipinos to instant insurrection. It was published by accident, and the insurrection followed. All these facts Mr. McKinley may have forgotten, but the future historian will not forget them; neither will he forget to characterize the conduct of a ruler who tried to shuffle away from the consequences of his own inconsiderate action.

The President's remaining Philippine novelties may be quickly dismissed. After deprecating the "exaggerated phrase-making" of those opposed to him, he tries his own hand at phrase-making, with the following result: "The American people will not make the murderers of our soldiers the agents of the Republic." Perhaps not, but the American President is, on his own showing, doing just that. Does he not, in another part of his letter, record with satisfaction the number of insurgent officers who have surrendered and taken the oath of allegiance? Have not many of these "murderers" taken office and so become "agents of the Republic"? And would not McKinley jump at the chance to bribe the lot of them with appointments? Phrase-making, indeed! More of it, and equally hollow, we see in Mr. McKinley's cool assumption that he is consulting the wishes of the "majority" of the Filipinos. What proof does he give of this—what facts—what figures? Not a shred. The accessible evidence is certainly the other way. But what does the President really mean? If a plébiscite showed that a majority of the inhabitants wished American rule withdrawn, would he withdraw it? Of course not. He has asserted that the islands are "ours," willy-nilly, and the desires of the natives go for nothing. Thus we see that all his talk about majority and minority, whether well based statistically or not, is pure claptrap, phrase-making of the most transparent kind.

One brief remark is necessary concerning the President's knowledge of the international laws of war. He gives fresh and official currency to the parrot cry that Dewey's squadron, after destroying the Spanish fleet, could not have been ordered away. "Whither would they ["our adversaries"] have directed it to sail? What port in the Orient was open to it?" The answer is, it should have been directed to sail for San Francisco, and any port would have been open to it for coaling purposes. Senator Sewell, who begged the President to order Dewey home, could have enlightened Mr. McKinley's ignorance on this point. Remember, Dewey reported his squadron uninjured; he probably had or could have helped himself in Manila to enough coal to steam at least to Honolulu; if not, he could have supplied himself at Hong Kong, at Port Arthur, at Nagasaki. The rule is, that belligerent cruisers may take on in neutral ports "so much coal as may be sufficient to carry them to the nearest port of their country, or to some nearer destination." Could not Dewey have done in a port of the Orient what Cervera did at Curaçao? The President's pretence that he could not is only a part of that beating of the air with which he protests against the political opposition of those who, as he tearfully complains, "rushed" him on to the war with Spain.

AN EXPERT ON THE PHILIPPINES.

Mr. John Foreman is conceded to be the prime authority on the Philippine Islands. A resident in the archipelago for eleven years; continuously acquainted with the natives for twenty; a frequent visitor to various islands of the group; possessed of a more intimate knowledge of Filipino character and a larger circle of friends and correspondents among the inhabitants than any foreigner living; the historian *par excellence* of land and people, he is a qualified expert to whom we are bound to listen. Certainly there is no need to labor this point with Republicans. He is their own witness, and they dare not try to discredit him. Professor Worcester, of both Philippine Commissions, constantly bows in his own book to the authority of Foreman. He was especially summoned to Paris by our Peace Commissioners as the very man to guide their uncertain steps aright. *Experto crede.*

What has this candid friend and recognized authority to say of the American experiment in the Philippines, so far as it has gone? An article in the September number of the *National Review* contains his views. It ought to be reprinted as a campaign document, for the sake of giving the American people some real and really unprejudiced information. Epitomizing what Mr. Foreman says, we find him of the belief that America, through gross mismanagement, has got into a frightful "dilemma" in the

Philippines, and is in danger of making herself "the laughing stock of Europe." Owing to the ignorance and blundering of our authorities, the overbearing conduct of our troops, and the failure to live up to the first principles of colonization, we have made a sad mess of it in the Philippines. This, be it observed, is quite irrespective of the policy of our taking the islands in the first place. Mr. Foreman, in fact, rather favored our taking them, but he never dreamed that we should display such ineptitude in trying to govern them. The present situation and outlook he thus defines:

> "The Americans barely occupy one-five-hundredth part of the total area of the archipelago, in places inaccessible by water. . . . They occupy, in fact, just as much as they can defend by force of arms. . . . Under the circumstances, the probability of the Americans ever gaining the sympathy and acquiescence of the natives is very remote. Unless the Americans are prepared to maintain a large permanent army in the islands, there seems to be no prospect of their ever being able to administer the interior of the archipelago."

On this precise point we pause to cite another bit of unimpeachable testimony. It is from the *Army and Navy Journal*, which says:

> "A correspondent writes us from the Philippines that he doesn't see how the force can be reduced in the Philippines this year, at least, and he is an officer of much experience in the archipelago. Every one, he says, is homesick. There is fighting in nearly every island, and officers and men are being picked off every day. It is going to take a long time, he thinks, to settle the question."

Yet Judge Taft is quoted by Mr. Frederick Palmer, in *Collier's Weekly*, as saying in so many words: "It is certain that we cannot long maintain 65,000 American troops in these islands. *The people of the United States will not stand the expense.*"

There, then, is the dilemma, which has resulted, Mr. Foreman says, from the ignorance of "the Washington political wiseacres." By reason of their "wavering policy," we are now "witnessing a sorry spectacle of useless bloodshed, which, 'for the sake of humanity,' we should be glad to see brought to a speedy close through any legitimate channel." Well, *que faire?* Mr. Foreman's plan would be for the United States gradually and conditionally to withdraw from the islands. He would have us control the foreign trade of the archipelago; retain naval stations as might be agreed; even ask the Filipinos (but surely we should be ashamed to do this) to reimburse us for the $20,000,000 which, in an evil hour, we paid for them and their lands. These details are comparatively unimportant. The main thing is that this chief Philippine expert considers American occupation of the archipelago a demonstrated fiasco, and that the proper thing for America now to do is to "extricate herself with honor."

Mr. Foreman scarcely alludes to American partisan politics. For all that appears in his article, he does not know that the subject of it is a burning question in a Presidential campaign. He writes, not to aid this or that party, or this or that candidate, but to urge the solution of a great problem near his heart. What he sees is that our Philippine policy was misconceived from the beginning, and that misery has stalked behind it from the first. Philippine agriculture and industry have been ruined. Filipino sentiment has been outraged. "Independence or death or perpetual warfare" is the fixed policy of the abler and educated natives. Something must be done. What Mr. Foreman would do is, as has been seen, very like what Mr. Schurz would do, not dissimilar to the plan which Mr. Bryan has said he favors. This, we are aware, is enough to condemn it utterly until the campaign is over; afterwards, it may be, even Republicans will admit that Mr. Foreman speaks not only with authority, but with truth and soberness.

STANDING FOR OFFICE.

When George Washington "proposed" himself to the electors of Frederick County, Virginia, as a candidate for the House of Burgesses, he was but following an age-long political custom of the English race. We see its survival in nearly full vigor in England to-day. Sir Edward Clarke made himself obnoxious to his Conservative party chiefs by his opposition to Chamberlain's Transvaal policy, and it is a question if he can secure a seat in the next Parliament. He has recently announced, however, that he will "stand" for one of the London constituencies. Similarly, the Right Hon. Horace Plunkett, who has done so much for the agricultural renaissance of Ireland, has become suspect of party irregularity, in the eyes of the Unionist managers, and they threaten to turn him out of his Irish seat. He appealed to Mr. Balfour, who, in a manly letter, advised him, no matter what the party agents might do, to "throw himself" upon the electors.

There we have the old and honorable way of seeking office. Men of parts, men of public spirit, men of laudable ambition, ask their neighbors, or their fellow-citizens of a wider than local circumscription, for an opportunity to serve the commonwealth. It is a frank and open proceeding. The appeal is primarily, of course, to common political sentiments—the *idem sentire de republica*—and party coöperation is usually implied. But it is the directness and simplicity of this way of getting a candidate before the voters which long endeared the name and the act of "standing for office" to American political affections. It was a part of our "career open to talent." We used religiously to teach our boys that, to eloquence and ability and character, the doors of political preferment would swing wide on oiled hinges. At any rate, the ambitious youth might rest assured that it would be wholly a question between him and the voters. He might freely "announce" himself a candidate, might decide to "stand" for a given office at the ensuing election, and nothing would then come between him and the verdict of his fellow-freemen.

We have changed all that—how completely, the defeat of Mr. Coler in the Democratic Convention comes freshly to bite into our minds. He was a man who had the audacity to say that he would stand for office if the people wanted him, and hell hath no fury like the bosses who fell upon and slaughtered him. It is not necessary to make a hero of Mr. Coler, or to insist that he is of the stuff of which political reformers are made. We say nothing about that. But no one can deny his ability, no one can dispute his great public services as Comptroller, no one but the chivalrous Roosevelt can question his courage. If we hold to Aristotle's definition of courage as great and noble in proportion to the object which calls it out, we shall have to reckon the courage of an ambitious young man who openly defies the corrupt boss of his party, as many degrees higher than that of a military hero who waxes valiant in the stricken field, but puts his legs meekly under *his* boss's breakfast-table. This high and fine political courage has certainly been displayed by Mr. Coler. He also struck out in the bold initiative—though it was, as we have said, only a return to nobler manners—of declaring that he sought his nomination, not from the bosses, but from the people.

No need to ask further for the reason of the extraordinary rage which such a candidacy aroused in the bosoms of both Platt and Croker. It was a blow at their common system. Once permit it to be seen that a man could "stand for office" in the free air of heaven, instead of crawling for office to 49 Broadway or to Croker's Club, and the boss business would be shaken to its foundations. Croker had special personal reasons for hating a man who had publicly referred to the smell of corruption on his gold, but both bosses worked hand in glove to compass the defeat of the impudent fellow who denied their divine right to bestow office. Their wrath was the wrath of a caste imperilled, a privilege assailed, a monopoly infringed upon. Like two mediæval brigands, the two bosses had apportioned the field of plunder. Dick Turpin was to rob coaches in the city; Black Tom was to waylay horsemen in the country roads. No wonder that they both thrust their pistols into the face of a man who called this ancient right of theirs "commercialism in politics." Dropping figures drawn from the highwayman's pursuits, trippingly though they fall from the tongue in speaking of our political methods, we may say that the fury of the bosses against Mr. Coler is very like that of the "King's Friends" against Wilkes a century and a half ago. Burke applied his keen analysis to the "violent rage for the punishment of Mr. Wilkes," and his conclusion was: "The point to be gained by the cabal was this: that the precedent should be established tending to show that *the favor of the people was not so sure a road as the favor of the court even to popular honors and popular trusts.*"

Does not this language exactly, almost startlingly, fit the situation to-day as Croker and Platt have made it? They are the court, the cabal, arrogantly asserting the right to distribute every political favor, and they will move heaven and earth rather than allow it to appear that a man can obtain office without crouching and creeping to them. That is the great lesson of Mr. Coler's defeat. Croker would wreck his party rather than let the masses of it nominate a man for Governor who did not wear a brand on his shoulder showing that he had served his time in the boss's galleys. This looks like a reckless and brutal proceeding, but Croker is quite right. It is a sure instinct which leads him and Platt to reserve a superheated hatred for any ambitious man who dares to consult the people without first consulting the boss. To tolerate this would be as fatal as it would have been for the silversmiths of Ephesus to allow the apostles to preach against idolatry. "This our trade is in danger," cried the image-makers, and "This our trade is in danger" is what the bosses shriek, blanched with fear, when they see a brave man appealing over their heads to the people direct.

This humiliating subjection of American freemen has gone on long, and there are few signs of their immediate escape from the thraldom. Mr. Coler, even, seems cowed. If he had not hastened to capitulate to his "party"—to a herd of cattle, that is, driven under Croker's lash—he might have put himself at the head of a movement which would have swept the State, to the confusion of both bosses. Some day, however, we shall find a man who will be bold enough and wise enough to throw himself upon the voters for election as Governor, as well as for nomination as Governor. That would be to stand for office in good old American fashion. As it is, every candidate for office in this State seems to think that the curse of the serpent in Eden is a stringent command laid upon himself: Upon thy belly shalt thou go, and dust shalt thou eat all the days of thy life.

THE PROHIBITION EPISODE IN MAINE.

The most curious and dramatic episode of the State election in Maine on September 11 was the contest for Sheriff in Cumberland County, which includes the city of Portland. In the face of large majorities for the other Republican candidates for State and local offices, Oren T. Despeaux, the nominee for Sheriff, was defeated by the Prohibition candidate, the Rev. Samuel F. Pearson of Portland.

Mr. Despeaux was elected Sheriff in 1898 by a plurality of 2,163, carrying eighteen of the twenty-six cities and towns in the county. His plurality in Portland was 772. In a total vote of 13,376, the Republican candidate received 7,299, as against 5,136 for the Democratic candidate, and 941 for Mr. Pearson, who was the Prohibition candidate in that year also. This year Mr. Pearson was elected by a plurality of 461, receiving 6,425 votes out of a total of 16,977. Of the votes for Mr. Pearson, Portland furnished 3,323—the same number, curiously enough, that it cast for Mr. Despeaux in 1898. For the other county offices the Republican candidates were elected by pluralities of over 4,000 in each case. The opposition to Mr. Despeaux, and, in consequence, the remarkable gains for the Prohibitionists, came largely from Republicans, many of whom voted the straight Prohibition ticket rather than take the chances of having their ballots thrown out as defective.

So remarkable a political upheaval has not occurred in Maine since the time of the Greenback campaign, when the Republicans lost the State, twenty years ago. Its immediate occasion, however, is entirely local, and is to be found mainly in the widespread dissatisfaction with the administration of the prohibitory liquor law in Cumberland County during the last two years. The bearing of the recent contest upon the liquor situation in Maine is so close, however, and its revelations of the state of public opinion on that subject so striking, as to give to the election in this particular more than local significance.

The history of the enforcement of the "Maine law" in recent years has been one of ups and downs, in which the increasing disregard for both the letter and the spirit of the law has been the feature of most prominence. By all candid observers the prohibitory law has long been seen to be a failure so far as the honest and effective regulation of the liquor traffic is concerned, while the general regard for it is unquestionably less to-day than ever before. As a natural consequence, the declining respect for the law has been accompanied by a widespread disposition to use it to maintain political influence and exact official blackmail. The sale of liquor by such persons as could pay well for the privilege has, in general, been allowed, while the rigors of the law have been visited upon those who failed to contribute the prescribed quota, or who, for any reason, incurred the disfavor of the officials temporarily in power. The amount of liquor fines turned into the various county treasuries annually is now very large, and has come to be an item of recognized importance in county finances; but since the fines in individual cases are usually $100 and costs, the actual régime in the State has for years been one of low license. Maine, in other words, has the benefits neither of prohibition nor of a well-administered license system, and the Republican party, which is responsible for the failure to give the people a chance to adopt some other plan, is widely charged with virtual alliance with the liquor interests, and with dependence upon the contributions of liquor-dealers, both within and without the State, for a large part of its campaign funds.

The laxity in the enforcement of the prohibitory law has not, however, been received with uniform acquiescence by the people, and a too outrageous disregard of the law has been more than once resented at the polls. The overturn in Cumberland County is the most striking recent manifestation of popular disgust with official corruption. A rigorous enforcement of the law in 1894 nearly cost the then Sheriff his reëlection, and for the next two years the expression at the polls was interpreted as a popular mandate in favor of a more "liberal" policy. The continuance of "liberalism" for two years more, however, brought the voters to the verge of revolt, and some of the men who were urging his election in 1898 on the ground that he would give the law a fair and reasonable interpretation, helped defeat Mr. Despeaux in 1900.

The administration of the liquor law throughout the county during the past two years has been a stench in the nostrils of decent people. A number of hotels in Portland have, within that period, set up and maintained open bars, while several smaller houses have derived their chief income from liquor sales. Liquor has been freely sold in saloons and stores all over the city, and at the restaurant of the Union Railway Station. In the larger towns of the county, outside of Portland, substantially similar conditions obtain, and in at least one large town the deputy sheriff himself is charged with having a pecuniary interest in a local saloon. The repeated efforts of prominent and influential citizens to close some of the worst resorts, and even to secure the abatement of disreputable houses, have met with scant attention and little success; suspension of business for a brief period being, in general, the most that could be obtained. In consequence of this "open-door" policy, the personal income of the Sheriff has reached a high figure, a conservative estimate of the value of the office fixing the income at $25,000 a year. That the receipts of the county have also been largely swelled is true, as is the further fact that the fee system, under which this large income is possible, is the creation of the Legislature, and, consequently, something for which the Sheriff is not responsible; but neither of these considerations avails to shake the firm belief of the public that the legitimate income of the Sheriff has been greatly increased by systematic exactions from liquor-dealers and from the proprietors of other illegal resorts.

If the people of Cumberland County really want a thorough-going and bona-fide enforcement of the prohibitory law for the next two years, a better chance of their getting it now exists than has for a long time been the case. Mr. Pearson, the Sheriff-elect, is a pronounced temperance advocate, and a man of force, vigor, and undoubted sincerity. His public pledges, given during the campaign, have been plain and explicit. There is little in the recent overturn, however, to indicate that a thorough-going enforcement of the law will meet with popular approval. What the people have protested against is systematic and unblushing protection of the liquor business for the financial profit of the Sheriff and his deputies; but there is small reason to believe that they will long accept a régime of strict enforcement. How Mr. Pearson will construe the popular mandate, when he has learned what the public really want, remains to be seen. If, before the end of his term, the devil of free rum and alleged "public sentiment" does not take him up on to a high mountain, and show him all the advantages and profit of compromise, it will be a new thing in the history of prohibition in Maine.

STRETENSK TO LAKE BAIKAL.

IRKUTSK, SIBERIA, August 18, 1900.

Stretensk is the present head of navigation on the Amur River—or, rather, of its principal branch, the Shilka. There the Trans-Siberian Railway now ends, connecting with boats for the lower part of the river. For short periods each year, however, the Shilka is navigable to Tchita, two hundred miles farther up, where the total elevation above the sea is 2,400 feet. In former times a vast amount of traffic floated down the river from this point during high water. Now the railroad carries it all on to Stretensk, which has rapidly grown to be a town of 7,000 inhabitants.

When we reached the place on the 5th of August, it was little else than a military camp. The war came on a year too soon for Russia. The railroad through Mantchuria branches off at Budaloffskia, about 150 miles west. Not only, however, is it not completed, but the Chinese have destroyed the part that has been built, so that there is no overland route for Russia to the field of action, except by way of Stretensk and the Amur. Below Stretensk the country is so rugged for 500 miles that there is not even a wagon-road, but only a bridle-path, and that a difficult one; so that, except when the river is frozen or in a full stage of water, this distance is practically impassable for an army.

The latter part of July and the month of August furnish the period of best navigation. The Russians are therefore hurrying forward troops with all possible speed, and are making use of every available week of transportation down the river. Altogether there are about forty steamers and twice as many barges running on this portion of the stream. On our way up, we met the entire fleet, carrying, as we estimated, about 15,000 soldiers. They had been delayed by low water. As it would, at the shortest, be two weeks before they could return for another load, resort was had to rafts and barges, hastily constructed for the occasion, which were set adrift to float down the current, being guided by huge oars projecting from the sides, and to some extent propelled by that means. These singular objects, loaded with soldiers and baggage-wagons and horses, seemed to transport us back to classic times when oars were the sole reliance in propelling battleships. At Stretensk hundreds of these rafts were being fitted up for immediate use. And they would all be needed; for the congestion at this point is bound to increase until the close of navigation. Since leaving the river, we have met regularly two long trains of soldiers every day, each carrying about 15,000 soldiers. Two weeks have now elapsed and still the stream continues. At Lake Baikal to-day we have witnessed the embarkation of two regiments upon the immense steam ferryboat which temporarily makes connection across the lake. Thirty freight-cars, with horses and provisions, and 1,500 soldiers were taken aboard at each trip, to be landed at the station on the other side, near the mouth of the Selenga River, about fifty miles distant.

This boat has been in use only a few weeks. Indeed, the railroad from Lake Baikal eastward has been opened only during the present year, and only a part of that time for regular passenger trains. Just what success it will have in the winter, and during the uncertain conditions before and after, remains to be seen. The crossing of Lake Baikal is one of the most difficult problems the engineers of the Trans-Siberian Railway have had. The entire southern end of the lake is surrounded by precipitous mountains, which are well-nigh impassable. A survey, however, has been made, but it involves the expenditure of a fabulous amount of money, and the plans cannot be carried out short of four or five years. Meanwhile, during the season of navigation, the transporting capacity of the road is limited by that of the ferriage across the lake. At present, there is only the one large boat which can carry trains, and it can make only two trips a day. There are smaller steamers, but their capacity is limited. Regular passengers are still transferred on these. Perhaps, however, this is because the entire service of the large steamer is now demanded by the army.

This steam-ferry, the *Baikal*, was made in England and put together here. It is 350 feet long, and wide enough to accommodate three railroad tracks side by side. It draws twenty feet of water, and its machinery is all below. An upper story furnishes state-rooms and dining-halls, while its upper deck easily accommodates a thousand soldiers. Under present conditions, it is a great success, but, as before remarked, how it will get along during the extraordinarily cold winter of this region, is a problem which must be regarded with much solicitude.

The distance from Stretensk to Lake Baikal is about 600 miles. The road is new, and, at the fastest, the Siberian trains run slow. We were three days of running time in making the distance. But the cars are very convenient and comfortable, and the eating-houses provide the traveller with the best of meals at about half the cost in the United States. There are first, second, and third-class coaches. The mass of the people ride in the third-class, at a charge of three-quarters of a cent per mile, for short distances, with liberal reductions on through rates. The third-class coaches are all provided with sleeping accommodations for each passenger. To be sure, it is only a hard plank, but it is ample in extent, and every one in Russia is expected to carry his own pillow and blanket. The second-class passengers have nicely upholstered seats which are readily transformed into beds, but they too must provide their own covering, as also must those of the first class. The sole advantage possessed by the first-class passengers is that when there are enough of them to occupy a section, a party can be secluded from the rest. There is no charge for the sleeping accommodations. The charge for second-class tickets is about twice that for the third-class, and for the first-class about three times that for the third-class.

The railway from Stretensk to Lake Baikal passes over the continental divide of Asia, rising to about 4,000 feet a little west of Tchita. The Yablonovoy Mountains, forming the crest of this divide, run southwest to northeast, extending continuously from Mongolia to Bering Strait. On the southeast they are bordered by a plateau about 2,500 feet above the sea. This is here about 200 miles wide, and possesses a climate and flora of its own, both of which are favorable to human settlement. All grains ripen readily when there is sufficient water, and everywhere on the uplands there is good pasturage. Immense herds of cattle were visible almost everywhere from the car-windows. Though the good land is by no means all occupied, there is already in Transbaikalia a population of about 700,000.

Nertchinsk, the first principal town passed through west of Stretensk, has been for two hundred years a centre of mining operations, to which the Government has sent convicts sentenced to hard labor. The city has a population of 6,700, and the department of 91,000. Tchita, a city of 12,000, where we stopped two days, is the capital of the province. One is surprised not only at the beauty of its situation, but at the fertility of the surrounding country. The railway is adding greatly to its importance. Its public and school buildings are numerous and imposing, but its streets are entirely without pavements. The territory from Tchita to Lake Baikal consists in the main of a plateau, 300 miles wide and about 5,000 feet above the sea, in which the headwaters of the Amur, the Lena, and the Yenesei take their rise at a common level. This tract is bleak and well-nigh uninhabitable. It, too, extends from the plains of Mongolia to the vicinity of Bering Strait. But the rivers have deeply eroded its surface, and furnished in their courses long lines of fertile fields. These are specially open to settlement towards the south. The railroad strikes over the eastern border into the valley of the Kylok, and for two hundred miles finds productive lands, congenial climate, and prosperous settlements. At Petroffsky we found a large and flourishing village gathered about a blast-furnace. The iron ore was near by, and the mountains furnished wood for charcoal to an unlimited extent. h

At Verkne Udinsk on the Selenga River we struck the great caravan route from Kalgan, China, across Mongolia. Over this route for hundreds of years the tea and many other commodities used in Russia have been brought on camels' backs. The city has a population of 8,000, and in midwinter is the scene of an enormous fair, at which millions of dollars' worth of goods are sold every year. Heretofore the best time to cross Lake Baikal and for travelling in general in this region has been in the winter, when it is frozen over. But all this will be rapidly changed now that the railroad is an accomplished fact.

We are apt to forget that this whole region has been the scene of some of the world's greatest historical events. It was in the valley of the Onon, which enters the Shilka above Nertchinsk, that in the twelfth century Genghis Khan originated. With its conquering tribes, this remarkable man overran China to the East, and Turkestan and Russia to the west, setting in motion the forces which drove the Turks into Europe. His conquests still profoundly affect the political questions awaiting the twentieth century. And now again it is a Mantchurian dynasty in China that is drawing the armies of the whole civilized world to a great contest on the shores of the Pacific. The tramp, tramp, tramp of these forces is continually in our ears, and their patriotic songs greet us at all times of day and night as they reverse the order of the thirteenth century, and go on their way to establish European dominion in the Far East.

G. FREDERICK WRIGHT.

THE PARIS COPYRIGHT CONGRESS.

PARIS, July, 1900.

The twenty-second international congress of literary and artistic property was held at Paris from July 16 to 21, inclusive, as one of the series of congresses being held in that city in connection with the Universal Exposition. The first of these copyright congresses was organized and held at Paris in 1878, during the Exposition of that year, and a second reunion took place in Paris during the Exposition of 1889. This year's congress was, therefore, the third which has been held in that city. In the intervening years there have been annual reunions in Amsterdam, Antwerp, Barcelona, Berne, Brussels, Dresden, Geneva, Heidelberg, Lisbon, London, Madrid, Milan, Monaco, Neuchâtel, Rome, Turin, Venice, and Vienna.

The fact that this Congress was only one in so extensive a series (one hundred and twenty-seven congresses) to be covered between the dates of May 24 and October 13, partly accounted, doubtless, for its having less of an official and formal aspect than the previous annual congresses held outside of France. It was strictly a working congress, with no unnecessary ceremonial, and with only a sufficient social and recreative programme to give one a pleasant sense of hospitality proffered and the needed rest and diversion between sessions. Needless speech-making was dispensed with, and, for the *usual proceeding of each official delegate* publicly presenting his credentials, as it were, in a short speech, there was substituted the selection of two delegates—M. Paul Wauwermans of Belgium (a speaker of some oratorical power), to speak in the name of the official delegates as a body, and M. Djuvara, the Rumanian Minister, in behalf of the larger contingent of other foreign attendants.

To encourage the attendance of persons interested, a special arrangement was made whereby, instead of the usual requirement of the membership dues of the Association Littéraire et Artistique Internationale and an additional attendance fee, one admission fee only, of twenty-five francs, was made available to any person "in the literary or artistic world" who should be presented by a member of any one of the twenty literary, artistic, or press associations under whose united auspices the Congress was held. Persons thus admitted not only were allowed to participate in the public sessions of the Congress, but were invited to be present at the social functions. In this connection it may be mentioned that neither official nor ordinary attendance included "dead-head" privileges. The membership card gave free admission only to the sessions of the Congress (not to the Exposition) when these were held within the Exposition grounds, and, in addition, to the special exhibition of the city of Paris. Twice, however, the members of the Congress were invited to special exhibits, and on those occasions membership cards gave admission to the Exposition grounds.

In the way of social entertainment something was provided for each day: Monday evening, reserved seats—largely unoccupied, owing to the great heat—at one of the theatres, where a classical performance was given; Tuesday afternoon, excursion to Chantilly—now the summer home of the Institute of France—with time for a detailed examination of the château and the treasures of the Musée Condé, in addition to a drive in the great forest, luncheon, and dinner; Wednesday, soirée at the home of the Minister of Public Works, where one was agreeably surprised to see the size and beauty of the gardens hidden behind the forbidding façades of the ancient aristocratic Faubourg St.-Germain; Thursday, five-o'clock reception—speeches and buffet lunch—at the Hôtel de Ville, and an inspection of the gorgeously decorated rooms; Friday, dinner given by M. Pouillet, President of the Association and of the Congress, in a restaurant on the first platform of the Eiffel Tower, with the fairy-like scene of the illuminated Exposition grounds spread out below; and, finally, on Saturday, an excursion by steamer down the Seine to Sèvres, with a visit to the famous manufactory, and a late dinner on the terrace at Bellevue, returning by river through the brilliantly lighted fair grounds.

The sessions of the Congress were not held at the Palais des Congrès, within the Exposition grounds, but at the "Hôtel du livre" of the Cercle de la Librairie, a noticeable structure at the east end of the Boulevard Saint-Germain, designed by Garnier, the architect of the Grand Opera-house. The large hall used for the public sessions was a handsome apartment, very suitable for the purpose, while smaller rooms served for committee meetings, etc. The attendance—affected by the exceptional heat experienced during the week of the Congress, and the counter attractions offered by the Exposition—was not large, rarely exceeding fifty to sixty persons at any one session, and varying greatly. The international official representation was not so great as might have been expected, eight nations only sending accredited delegates: Belgium, Paul Wauwermans; Ecuador, Pallares Arteta; France, Alexandre Chaumat, from the Ministry of Justice, M. Lanel, from the Ministry of State, and MM. Desjardin, Lionel Laroze, and Poupinel, from the Ministry of Public Instruction; Mexico, Gustavo Baz, Sres. Contrevas and Ireneo Paz; Norway, Stand Lund; Russia, M. Pilenko; Spain, Sres. Calzado and De Huertas; the United States, Thorvald Solberg. In addition to these, the German and Swiss representation was of a quasi-official character, the contingent from Germany including, among several delegates, Dr. Albert Osterrieth of Berlin, who has been a prominent figure in previous congresses for several years, while from Switzerland the Berne International Copyright Bureau was represented by its highly honored director, M. Henri Morel, and its First and Second Secretaries, Prof. Ernest Röthlisberger and M Léon Poinsard. England was again conspicuous by the absence of any representative. Italy, though not officially represented, indicated her lively interest in copyright matters by the strength of her delegation. Unofficial representatives were also present from Brazil, Japan, Monaco, and Rumania.

As Parisian literary celebrities had distinguished previous copyright congresses by their presence, their non-attendance at this Congress—with the exception of certain juridical writers of note interested in copyright—was noticeable, and an unexpected disappointment, although it was not difficult to understand why Parisians should shun the capital during a period of such unusually high temperature and the anomalous conditions incident to the great Fair. The novelist, Marcel Prévost, was to have delivered the address of welcome, but was prevented by illness. M. Georges Leygues, the Minister of Public Instruction, presided at the formal opening session. It was, as has been stated already, a working congress. Committee sessions began at 8:30 o'clock, and the working-day extended to four or five o'clock, with intermission only for "déjeuner." The committee meetings, open to such members of the Congress as were interested, were very informal, the chief workers sitting around a large oval table in the centre of the room, with others grouped about, and afforded opportunity for an interesting exhibition of French vivacity and warmth of discussion, tempered by unfailing courtesy and good humor.

Instead of the usual long and varied programme, it was wisely planned to concentrate the attention of the Congress more especially upon one important subject for discussion, viz., the text of a proposed typical law for the protection of literary and artistic property. A paper by M. Édouard Mack, entitled, "Du domaine public payant," dealing with the question of the rights inherent in literary and artistic works after the expiration of the statutory term of protection, was read; but although considerable interest was shown, the Congress came to no conclusions concerning this important subject, referring the matter for further consideration to some future congress. The sessions of one day were devoted to considering the present status of copyright in various countries, papers or oral reports being submitted for Austria-Hungary, by Dr. Carl Junker (summarized by Professor Röthlisberger); Germany, by Dr. Osterrieth; Italy, by Sig. Ferrucio Foá; Japan, by M. Saburo Yamada of Tokio; Rumania, by his Excellency T. G. Djuvara; Russia, by M. Pilenko; Spain, by Señor de Huertas; Switzerland, by M. Léon Poinsard; the United States, by the Register of Copyrights. A brief notice of the Convention of Montevideo—the copyright union of the Latin-American countries—was submitted by M. Alcide Darras of Paris.

The special feature of the Congress, as previously stated, was the evolution of the text for a "type" law of copyright. The programme was admirably arranged to eliminate from the public sessions (*séances plénières*) unnecessary debate by providing four preliminary, informal sessions devoted to a free discussion of the subject by writers, dramatists, composers, artists, and publishers, in its relation, respectively, to literary, dramatic, musical, and artistic productions, and the adequate legal protection for each, followed by three general sessions in which each article of the proposed law was separately read, discussed, and voted upon. The theme was not new. In previous annual conferences of the Association Littéraire et Artistique Internationale the subject had been threshed over upon reports presented at Dresden, 1895; Berne, 1896; Monaco, 1897; and Turin, 1898. At this last Congress the matter was referred to a committee of twenty-four, under the chairmanship of M. Pouillet. This body was fairly representative of the various interests involved, even architects and engineers being represented. Special recognition is due, in this connection, to M. Georges Maillard, the editor of *Annales de la Propriété Industrielle, Artistique et Littéraire*, for his persevering and intelligent labor, extending over a series of years, in collating the material regarding this question, and for his excellent presentation of it. The text submitted to the Congress was made up from the various votes and resolutions after careful comparison. It was discussed with warm and sustained interest, amended in several particulars, and adopted by affirmative vote on each article. Want of space prevents at this time more than a brief summarizing of the principles embodied, but I hope to return to this important document later. For the sake of brevity, related provisions are brought together without regard to deviation from the order of the paragraphs in the text adopted.

The principal provisions of this proposed model law may be summarized as follows: The *author* of a work of the intellect—without regard to his nationality, or the place of first publication of his production—has the exclusive right to publish or reproduce it, by whatever process, in whatever form, or for whatever purpose. This right applies to all manifestations of thought, written or spoken, including contributions to the press, dramatic, musical, and choregraphic productions, and all works of graphic and plastic art, independent of their merit, use, or destination. The exercise of this right should not be subordinated to the accomplishment of any formalities whatever. Collaborators have equal rights in their common work, unless there should be stipulations to the contrary; and in the case of an author dying without heirs, his part accrues to the benefit of the other joint authors or their heirs. The author's exclusive right covers all reproduction, in whole or in part, made without his consent, as well as translation, representation, and public performance, abridgment, adaptation, illustration, additions, alterations, dramatization of novels, or transformation of plays into novels. Reproduction by means of another art, rearrangement of music, and reproduction of music by musical instruments, and any such reproduction without his consent or the consent of his heirs, are illegal.

Short citations from a published work—with proper credit given—and reproductions of Parliamentary debates and addresses delivered at public meetings, for the purpose of criticism, discussion, information, or education, are permissible, and laws and judicial decisions are held not to be subject to copyright.

The author's right of reproduction is held to be independent of the right of property in the material object, and the cession of the latter does not carry with it the transference of the right of reproduction. The cession of any rights appertaining to an author is to be restrictively interpreted. The term of copyright is the life of the author and eighty years after his death; in the case of joint authors, eighty years after the death of the last survivor; and for anonymous and posthumous works, eighty years from the first authorized publication. This acceptance of the principle of a statutory limitation of the term of protection was not acquiesced in without demur on the part of those in favor of the perpetuity of copyright. The period fixed upon is that contained in the most liberal modern legislation embodying a limitation of the term of protection, namely, that of Spain.

In the case of illegal reproduction, the confiscation of plates and other articles pertaining to the infringement, and, upon unauthorized representation or public performance, seizure of the total receipts, shall be made for the benefit of the author or his heirs.

The proposed law differs most widely from legislation now in force in its careful provisions for enforcing the "moral rights" of an author. It is held that an author has the right to make known his authorship and to seek the protection of the courts against its usurpation; and that ceding his right of reproduction does not deprive him of the right to sue an infringer, or to scrutinize the reproduction of his book, and to oppose all modifications made without his consent, or to oppose the public exhibition of his work if changed against his will; and, after the author's death, in default of a proxy previously appointed by himself, his heirs have the power to insist that these moral rights shall be respected. No modification shall be made in a work after the author's death without notification to the public. Any trespass on these rights of an author, or the usurpation of his name, or any fraudulent imitation of his signature or distinctive mark adopted by him, shall be just cause for an action for damages, and, if wilfully made, for a penal suit.

Among the miscellaneous resolutions voted by the Congress were several relating to the possible amendment of the Berne Copyright Convention. The changes desired are in the direction of international protection for architectural works upon the same basis as that of other works of art; direct stipulation that the transfer of a work of art shall not involve the assignment of the right of reproduction; and the provision that the usurpation of an artist's name, or any distinctive mark adopted by him, shall be subject to criminal-law penalties. It was also thought that it would be preferable to abrogate all special copyright treaties entered into before the International Copyright Union was formed, retaining in force only such provisions in the special treaties as secure more favorable conditions than the articles of the Berne Convention; and that, as the coexistence of special treaties and the Berne Convention complicated to no purpose the protection in force within the Union, such special treaties should be discouraged and a definite effort be made at the next diplomatic conference for the revision of the Berne Treaty, to have incorporated into its text all provisions in special treaties more favorable than the stipulations of the Berne Convention. But if special treaties are entered into, they should contain no stipulations *less* favorable than the concurrent provisions of the laws of the contracting countries.

The desire was expressed by formal vote that the principal countries not yet within the Berne Union, notably Austria, Denmark, Hungary, the Netherlands, Rumania, Russia, Sweden, the United States, and the Spanish-American republics, be urged by the Executive Committee to become members of that Union. It was proposed also that the Treaty of Montevideo be studied in comparison with the stipulations of the Berne Convention with a view to obtain the adhesion of the South American republics to the latter.

There was some criticism of the provisions of the United States laws in force, and a special vote was passed expressing the hope that Congress would repeal all such provisions in the present law as debarred the United States from entry into the Berne Union.

Expressions of sympathy were voted in recognition of the efforts being made to amend and enlarge copyright protection in various countries—Austria-Hungary, Germany, Italy, Rumania, and Switzerland. Among the miscellaneous resolutions passed, it was held that photographic works should be accorded the same protection given to graphic and plastic works of art; that the reproduction of press dispatches pure and simple be forbidden when it assumes the character of unfair competition, and that it should be a recognized principle that the artist has a right to demand the affixing of his name to his work.

The printed bibliography of the Congress is unusually meagre. Besides M. G. Maillard's 'Loi-type,' and Édouard Mack's pamphlet on 'Du Domaine public payant,' there is a 4-page leaflet, 'Sur le projet de réforme de la loi italienne [of copyright],' by Dr. Ferrucio Foá, and two Bulletins of the Association Littéraire et Artistique (3e série, No. 10), "Documents et Rapports," three monographs: "Du droit moral de l'auteur sur ses créations," by Jules Lermina, Édouard Mack, G. Maillard, and A. Vaunois; "De la protection des œuvres de l'art appliqué," by E. Soleau; "De la protection des œuvres scientifiques," by G. L. Pesce; (3e série, No. 11), containing a useful summary and index of the reports of the Association from December, 1878, to July, 1900, by M. Lermina, Secretary, a preface by President Pouillet, the statutes and by-laws, and a list of the members.

The next Congress will meet at St. Petersburg in 1901.

Correspondence.

MR. BRYAN'S CONSISTENCY.

To the Editor of the Nation:

SIR: In your paper of the 6th inst., I notice the remark that Mr. Bryan's support of the Spanish war, and his favoring the ratification of the peace treaty, and "some other things," prevent your crediting him with sincerity in his recent utterances with regard to the policy of our country toward the Philippine Islands. You also say that Mr. Bryan is the only prominent Democrat who has professed such sentiments, and that there is nothing to indicate that his party is behind him.

Permit me to call your attention to the fact that a year ago, in this very town, Mr. Bryan was professing the same sentiments. His address at Indianapolis was the same in substance with his speech here of a year ago. On that occasion Mr. Bryan was asked in my presence whether it was not probable that the Republican policy would be reversed, and that party declare in favor of the eventual independence of the islands. His answer was:

> "I wish it might be so. I am not partisan enough to wish any advantage from what I regard as a menace of disaster to my country, but I do not consider it possible that the commercialism now dominant in the Republican organization will permit it. They would fear too much to be called to account for the money and lives already expended in holding the islands."

Mr. Bryan and his supporters made the campaign in this State a year ago upon this issue. Of his persistence and sincerity in it there can be no question. What the "other things" are which you mentioned I, of course, do not know, but that Mr. Bryan if elected would be able and determined to reverse the present Philippine policy seems to me beyond cavil. Enough Republicans would be glad to drop it.—Yours,

W. G. HASTINGS.

WILBER, NEBRASKA, September 12, 1900.

THE CURE FOR THE IMPERIAL DOG-BITE.

To the Editor of The Nation:

SIR: The Republican voters who deplore many past results of our course in the Philippine Islands, but whose convictions coincide with the general policy of their party, are asked by the *Nation* to transfer or withhold their votes by reason of the paramount importance of the particular feature above indicated.

It is apparently conceded that such voters are justified in regarding the Democratic candidate as pledged to carry out inexorably a financial policy which is not merely dangerous to prosperity, but subversive of national honor, and also as asserting views of social organization which are antagonistic to law and order.

The allegation, however, is, that the dangers of Imperialism are so pressing as to *justify acquiescence* in the success of such a *candidate; and, moreover,* that by placing him and his party in power these dangers would be averted.

The former position has heretofore received more attention than the latter, to the detriment, it would seem, of a comprehensive view, for it would be a sorry thing to make the sacrifice without a reasonable certainty of the desired result. It is of primary importance, therefore, to consider dispassionately whether a Democratic victory will, on the whole, tend to eradicate the alleged dangers.

The *Nation*, of course, uses the term "Imperialism" not as a mere campaign epithet, but as indicating the maintenance of a government, at present wholly external, but with the bona-fide intention of admitting the governed to progressive participation therein—a participation whose extent shall, it is true, be determined by ourselves, but which shall be as full as other responsibilities will permit.

The objections to this, or any other form of government not wholly proceeding from the governed class, lie in the danger of actual injustice to the subject and of injury to his self-respect, on the one hand, and, on the other, in the possibly graver danger of destructive reaction upon the morals and political ideals of the dominant class.

Now, can it be doubted that the tendency of the Democratic party, throughout the relatively large portion of our country where it is supreme, has been and is directly towards domestic Imperialism? Is it not the frankly avowed purpose of the most sincere and upright Southern Democrat to exclude practically a whole race, heretofore recognized as full citizens, from participation either in local or in general government? And does not every Imperialistic danger, both to the governed and to the dominant race, lurk in the policy thus asserted?

It would be unprofitable, in a communication of this character, to discuss the question whether the exclusion of the Southern negro from political rights may not be, on the whole, beneficial to him as well as to the community. So, also, would it be unprofitable to dilate upon the safety of Philippine interests in the hands of a Commission whose personnel is admirable, and whose charter of powers embodies our own Bill of Rights as an organic condition of the grant. The practical question is, whether the Democratic party, wherever it is in full control, is not wedded to a policy which is really Imperialism under another name.

Admitting that the Imperialistic spirit, in any form, is to be regarded with the greatest apprehension, shall we eradicate it by intrusting our Government to a party wherein so large an element fosters that spirit as a permanent and essential condition? The negro question of the future is not a mere sentimental reminiscence of past conflicts, but a social and political problem, fully as grave as that presented by the Philippine situation.

It would seem that the Republican voters to whom the *Nation* addresses its undoubtedly forcible persuasions, must choose between stepping backward, *towards* domestic Imperialism, as an ultimate goal, or stepping forward, *beyond* Imperialism, towards substantial self-government in our foreign possessions. Other things being equal, one might well prefer the party whose principles have heretofore been based on that view of human things which makes permanent Imperialism impossible; but, in the present case, other things are far from equal, for a Democratic victory means domestic Imperialism, plus Bryanism.—Very truly yours,

JOSEPH C. FRALEY.

PHILADELPHIA, September 11, 1900.

[Our correspondent is quite right in identifying the spirit of slavery (or that which disfranchises a black man on any ground for which it will not disfranchise a white) with the McKinley spirit that insists on ruling the Filipinos *vi et armis* for their own good. He is obviously quite wrong in choosing the Republican party as an instrument for suppressing Imperialism in the Philippines. It is Senator Hoar's way, but there is no more sense in it than there would be in choosing the Democratic party as an instrument for restoring equal political rights at the South. And what does Mr. Fraley's Republican party propose to do about *that?*—ED. NATION.]

GOVERNMENT BY INJUNCTION.

To the Editor of The Nation:

SIR: Your comments, in your issue of September 6, upon Mr. Bryan's "unimpeachable" references to government by injunction in his Labor Day speech in this city compel me to draw your attention to some other publications on that subject, as I like to have the *Nation* agree with me, and additional information and thought may cause you to change your views.

The first is an opinion by the Supreme Court of Appeals of Virginia (Carter vs. Commonwealth, 45 L. R. A., 310). The question in the case was whether a legislative act prescribing that contempts of court should not be punished without a jury deprived the court of jurisdiction to punish the contempt without the intervention of a jury. The Court said, in its opinion: "In public apprehension the Legislature is deemed in a peculiar sense the agent and representative of the people," but "a court and judge thereof is as much an agent and servant of the people as any other officer of government." Moreover, "in the courts created by the Constitution there is an inherent power of self-defence and self-preservation," and "this power may be regulated but cannot be destroyed, or so far diminished as to be rendered ineffectual by legislative enactment"; "the inherent power of courts created by the Constitution to enforce respect and obedience by punishing contempts without a jury trial cannot be taken away by the Legislature."

The Supreme Court of this State recently said: "If the Legislature by inadvertence assumes the exercise of a power belonging to the judicial department, it should only be necessary to call their attention to the restraint imposed by the Constitution."

The law as to injunction in labor disputes was pretty well settled by the United States Supreme Court in the case of E. V. Debs (158 U. S. 564), and I had always understood that nothing was passed by Congress changing that law for the reason that the lawyers of that body could see no way of doing it.

A very good exposition of this question from a layman's point of view was given in the *Nation*, No. 1683, page 256, and I am only sorry that your paper has now gotten so far from the views therein expressed.

My own opinion is, that there would be more danger to the institutions of this country from a serious and thorough attempt to change the law on "government by injunction" than there is from "Imperialism"—and I am as much of an Anti-Imperialist as need be.

Yours truly, JAMES A. MILLER.

CHICAGO, September 10, 1900.

[It is one thing for a court to punish an act of contempt committed in its presence, or by a particular person who has been commanded to do or refrain from doing a specified act. It is another thing for a court to enjoin all creation from violating the law or disturbing the peace. Sheriffs and constables ought to preserve order, and it is plain enough that if courts of equity undertake this task, the political consequences may be disastrous.—ED. NATION.]

WAS THE TRANSVAAL A FOREIGN STATE?

TO THE EDITOR OF THE NATION:

SIR: Mr. Allison will find that the character of the Transvaal as a foreign state was distinctly recognized in the case of the Jameson Raiders, who were tried under the Foreign Enlistment Act for fitting out an expedition against a foreign state friendly to the British Government.

I did not say that any women and children had been turned out to perish. I deprecated the farm-burning policy of the violent party in England, as tending to that result. An English journal compares their proposals to the proceedings of Weyler in Cuba. EQUITY.

September 15, 1900.

Notes.

John Morley's study of Oliver Cromwell now running in the *Century* will be brought out in book form by the Century Co. during the autumn.

Next month Macmillan Co. will have ready 'In the Palace of the King,' a love story of old Madrid, by F. Marion Crawford; and 'America's Economic Supremacy,' by Brooks Adams, is just appearing.

Ginn & Co. publish directly 'The Beginnings of English Literature,' by Prof. Charlton M. Lewis of Yale.

The rubricated edition of Sterne's 'Sentimental Journey' just issued by Dodd, Mead & Co. is handsome in the main, but lapses from the nicest taste in its overweight of black and red in the running-title. "Arranged, designed, and printed by the University Press, Cambridge, U. S. A.," we read on the verso of the title-leaf; and this vouches for a degree of excellence in the typography sufficient to satisfy the ordinary purchaser.

Prof. J. B. Thayer of the Harvard Law School has brought out a second edition of his 'Selection of Cases on Evidence at the Common Law' (Cambridge: Charles W. Sever & Co.). This book, which may now be considered a companion volume of the author's recently published treatise on Evidence, has already attained (partly through its notes and partly through its arrangement) a distinct and enviable independent standing as a book of the law. It is, of course, primarily for students, but, as it has often proved in other cases, the book for students has turned out to be also the book for practitioners. In the present edition the size of the volume is not much increased, but many changes and improvements have been made.

With volume vii., Prof. J. B. Bury completes his scholarly edition of Gibbon's 'History of the Decline and Fall of the Roman Empire' (London: Methuen & Co.; New York: Macmillan). The appendix is comparatively brief, and is most valuable for its enumeration of sources regarding the siege of Constantinople unknown to Gibbon; yet these sum up in weight disproportionately to their number. Mrs. Bury has compiled the index, which fills more than sixty pages.

It is amazing how long it takes the military glories of the present Administration to penetrate the cyclopædias. Here is the Rev. James Wood's 'Nuttall Encyclopædia,' in its twentieth thousand (London and New York: Frederick Warne & Co.), which admits Col. Bryan—but purely for his civic prominence—while never a mention is made of Roosevelt, Miles, or Otis, of Dewey or Sampson, of Lodge or Long. Such unstrenuous characters, on the other hand, as Henry James and John Fiske, Howells and "Uncle Remus," and Bret Harte, have, by some "pull" or conspiracy, forced their way in. The warriors, however, are neglected along with many American men of science and poets, as was to be expected in an English encyclopædia. We turn next to the prominent figures in the South African revolution, and here Dr. Jameson's name "leads all the rest." He gets 18 lines for himself and his "ill-fated" expedition, while Kitchener gets 16, Chamberlain 11, Cecil Rhodes 10, Roberts 9, and Krüger 7. The work has the shortcomings inevitable from its size, but will be useful to many who can afford nothing larger.

All three of the Presidential candidates who genuinely divide public attention figure in the volume of 'Patriotic Eloquence relating to the Spanish-American War and its Issues,' compiled by two professors of elocution, Messrs. Robert I. Fulton and Thomas C. Trueblood (Scribners). Sufficiently full examples are given in 340 pages, from Lyman Abbott to Henry Watterson and Senator Wolcott. Senator Lodge would probably not allow Senator Hoar's eloquence to be patriotic. Both are represented, along with Bourke Cockran, Chauncey Depew, Secretary Long, Whitelaw Reid, Carl Schurz, Charles Emory Smith, Henry van Dyke, and many others, including even Sir Wilfred Laurier. Biographical notices are appended, and such has been the aptness of the selections (generally revised as well as often pointed out by the respective orators) that the compilation is really a useful campaign text-book.

The E. P. Grow Publishing Co. send out a pretty little volume on the Brook Trout, by Charles Barker Bradford. There is not much of the literary quality in it, but the angler will find enough of practical value to make it a welcome addition to his library. Its most interesting feature is a description, or rather series of descriptions, of a trout region in the Pocono Mountains of Pennsylvania. D. W. C. Farrington contributes a few pages of humorous "Trout Truths," which contain more of the real essence of angling than many an entire volume. For instance, "The desire for fishing is like some diseases, in attacking a man with great severity without notice." Or, "A cloudy day is best except when they rise better on a bright sunny one. They also often bite well when it rains." A letter of hearty appreciation from ex-President Cleveland is reproduced in miniature.

The younger generation, lay or medical, naturally places greater stress upon the efficacy of medication than do those with a wider horizon of experience, who see that guiding rather than forcing brings back aberrant health. The elders recognize how much disease is self-inflicted by unconscious violations of the laws of physiology, and Dr. George S. Keith's 'Plea for a Simpler Life' (London: Black; New York: Macmillan) is an appeal, especially to the British public, to eat and drink less, and to his profession to assist nature by inculcating abstinence (miscalled starving), by the internal and external use of heat, by placing a true estimate upon some of the extract-foods, and by narrowing the limits of gross therapeutics. He does not discard medicine, but he is not its servant. Bound within the same covers is another essay, infelicitously entitled "Fads of an Old Physician." "Fad" implies a whim rather than a principle, and is an unworthy name to apply to the serious convictions which illustrate the general doctrines of the 'Plea.' Taken together, these papers are the conclusions upon modes of life of an educated physician of advanced age, expressed in plain language; and, with the allowance that every intelligent reader should make in applying general rules to his particular case, they are worthy of careful attention by those who desire to maintain or to regain health under the conditions that surround the well-to-do.

Dr. W. L. Pyle's 'Manual of Personal Hygiene' (Philadelphia: W. B. Saunders & Co.) is a group of collaborated essays upon the maintenance of health. They are unequal in literary and in practical value, and as a whole do not seem well adapted to instruct the laity or to inspire their guardians. They teach no heresy; but to be ill-adapted to a special purpose a paper does not require to be untrue.

The Massachusetts Historical Society's thirteenth volume (New Series) of Proceedings contains the record of meetings from March, 1899, to February, 1900, as well as several papers of interest and of permanent value. President Charles Francis Adams's belated inaugural address on "Historians and Historical Societies" we noticed at the time of its delivery. We have also made mention of Mr. Adams's other contribution on the detention of the Laird rams by the British Government in October, 1863, in correction of the late L. E. Chittenden's 'Recollections.' An early attempt at colonization in the Bahama Islands is described by Mr. John T. Hassam, and an error in the resolution of Congress admitting Missouri into the Union by Lucien Carr. An illustrated paper by Andrew McFarland Davis treats of "Occult Methods of Protecting the Currency; Sewall's Mnemonic Lines and their Interpretation." Still other contributions are "The Record of the Council of Massachusetts during the Presidency of Joseph Dudley," "Extracts from the Diary of Increase Mather, made by Jeremy Belknap," and some curious original documents from the apparently inexhaustible collection of the Winthrop papers. There are biographical notices of Clement Hugh Hill, by C. C. Smith; of Charles Francis Adams, by his son and namesake; and of Gen. Francis A. Walker, by F. C. Lowell, each with a portrait. A certain tenderness for Grant's memory is shown by the suppression of his name (p. 135) in connection with Mr. Hill's dismissal from the Assistant United States District-Attorneyship on account of his part in the prosecution in the District "Safe Burglary Case." The informal tributes paid to the memory of Chief-Justice Field, Professor Dunbar, John C. Ropes, and other deceased members are reported in full. Students should be made aware that the papers of the late S. P. Chase have been deposited with the Society on conditions set forth by Chase's biographer, Prof. Albert B. Hart (p. 378). A heliotype of the new and elegant building of the Society on the Fenway, in Boston, forms a frontispiece to the volume.

It seems almost reactionary, in a pictorial and "kodak" age, to find no provision made for photographs in the tourists' vade-mecum, 'Places I Have Visited,' just issued by Dodd, Mead & Co. This blank book allots four pages to items respecting date of visit, company, stay, historic or literary associations, incidents of the journey, and general impressions. Photographs might be inserted to a limited extent without warping the book, which is well adapted for its purpose otherwise.

On October 1 is to be issued in Brooklyn the *New York Latin Leaflet*, weekly, "devoted to the High-School-College Entrance Scholarship Fund." The Latin teachers who conduct it will primarily discuss "Latin or Greek topics touching the secondary field of Latin and Greek instruction." The fund above named is intended to reach the sum of at least $6,000, yielding $250 or $300 for an annual award, "on a competitive examination, to the most successful candidate from the high schools of Greater New York." The *Leaflet* may be addressed at Eastern District High School, Driggs Avenue and South Third Street, Brooklyn.

In the forthcoming October number of the *American Historical Review*, Prof. George L. Burr will have an article on the Guiana boundary, reviewing the fresh evidence upon the subject brought forward in the case and counter-case of Great Britain and Venezuela before the arbitral tribunal at Paris. In the same number a possibly unique document, of much interest in the social history of the period to which it relates, is the Diary of John Harrower, an *indented servant* (Scotsman, or rather Shetlander) serving as a schoolmaster in Virginia, 1773-1776.

The making over of New England is a curious subject of study. Externally, the civil war was the cause of the multiplication of soldiers' monuments, of all shades of badness and with rare successes; often set in such flagrant disregard of the surroundings as to ruin the harmony of a rural village. Then came the public-library movement, and if some of the new buildings jarred on the sense of fitness as did the soldiers' monuments, not infrequently an old homestead was adapted to the new use, *and perhaps the majority of fresh designs have been ornamental.* Methuen, Mass., has been fortunate in both these particulars, and exhibits, besides, a new departure in a costly and imposing Washington Monument, designed by Thomas Ball. Neither this structure nor the well-conceived soldiers' monument, nor the Memorial Library, appears to deface the handsome old town, which also boasts some pretentious private estates. The subject is treated with numerous illustrations in the *New Englander* for September, by Charles H. Oliphant.

Some months antecedent to their complete reporting on the total eclipse of last May, so successfully observed in our Southern States, from New Orleans to Norfolk, in Spain and Portugal, and in Algiers and Tripoli, astronomers are already preparing for another and far longer obscuration, which, if fortune and the weather favor them, will be the longest eclipse ever observed. In a recent number of *Nature*, Dr. J. J. A. Muller, President of the Royal Natural History Society of Batavia, Java, presents some preliminary statements regarding the regions to be visited by this exceptional phenomemon, which lasts for no less than six and one-half minutes on the west coast of Sumatra, on the 18th of May, 1901. Padang is the largest city within the path of totality, and a railway leads into the interior. Localities in Borneo afford stations of less value in point of length of the eclipse; and the same is true of Celebes and the Moluccas. The Society, following the initiative of an American astronomer in the eclipses of 1893 and 1896, has been collecting data referring to the conditions of the weather and cloudiness at a number of very suitable stations, and full information is offered as to the choice of localities. Observers may be sure to receive every available assistance from the local authorities and officials in the Dutch colonies.

The appreciative account of the United States educational exhibit at the Paris Exposition, from the competent pen of M. Gabriel Compayré (*Revue Pédagogique*, August 15), may, for many busy readers, prove a welcome substitute for the two volumes of monographs prepared in this country as a complement of the exhibit. The value of this publication, however, may be inferred from the fact that M. Compayré recommends its translation into French.

—'Side Lights on the Reign of Terror' (John Lane) is a translation of the memoirs of Mlle. des Écherolles, a work originally printed for family friends under the title, 'Quelques Années de ma Vie.' Lamartine thought highly of it, and one can understand his admiration, for it is the kind of book which is likely to find favor with persons of sympathy and imagination. The demand for fresh recitals of adventure during the years 1792-94 is constant, and points to an interesting condition of the public mind. Amid the wars and tumults of mediæval Italy, the poet sighed for the peaceful days of the Good Augustus. Now, in the midst of great ease and comfort, there is a disposition to recall the excitement and the ghastly tragedies of the Terror. When the issue of new books on this subject is suspended, an old volume of memoirs, which has been half or wholly forgotten, is produced from the stack of some large library, is translated, illustrated with photogravures, and reprinted with the positive certainty of a sale. The autobiography of Mlle. des Écherolles belongs to the class which we have just described. It is a tale of personal vicissitude, wholly devoid of political character or literary association, and dependent for its success on the ingredients of peril and unexpected escape. The heroine was a daughter of Étienne François des Écherolles, a distinguished officer of the monarchy, who sympathized with the early aims of the Revolution and became a commander in the National Guard. When the radicals gained control, he, like many others of Feuillant tendency, drifted toward reaction, left Paris for Lyons, and took part in the resistance of that town to the republican forces. The siege of Lyons is an episode of some moment in the history of the Revolution, and it fills the chief place among the historical events which are described by Mlle. des Écherolles. After the troops of the Convention had entered the conquered city, M. des Écherolles was condemned, and escaped only after he had survived some remarkable dangers. For instance, he was imbedded in a mattress upon which his devoted hostess lay during a visit of search officers. His daughter, owing probably to her extreme youth, was spared, but remained an object of suspicion and endured great privations from poverty. A comparatively unexciting but valuable part of the book is that which describes the routine of life in the Provinces during the Revolution. Mlle. des Écherolles finally left France and entered the service of the Duchess of Würtemberg. Her reminiscences create a pleasant impression by their simplicity of tone, while the amount of domestic detail which they furnish places them in the class of historical materials.

—In his 'Light from the East, or the Witness of the Monuments' (London: Eyre & Spottiswoode, 1899), the Rev. C. J. Ball takes occasion to discuss the Phœnician alphabet, and to present, in a somewhat new shape, the argument for its Babylonian origin. Since De Rougé propounded his theory of the Egyptian derivation of the alphabet, some half century since, it has been the generally accepted belief that it was derived either from the Egyptian hieroglyphic or the Egyptian hieratic characters. In De Rougé's time, practically the only script more ancient than the Phœnician of which scholars had knowledge, was the Egyptian. The close commercial connection of Phœnicians and Egyptians, and the borrowing of the former from the latter in the spheres of religion and art, the recognized antiquity of the Egyptian script, and the fact that out of that Egyptian script there had been developed in Egypt itself something approximating to an alphabet of twenty-five characters, led De Rougé to identify the twenty-two letters of the Phœnician alphabet with the same number of Egyptian signs. With the information then available it was natural that he should have made such an identification. Increased knowledge, the result of recent explorations and discoveries, has rendered necessary a reconsideration of De Rougé's theory. Besides the ancient Egyptian hieroglyphic and hieratic scripts, known in De Rougé's time, we now have the Babylonian cuneiform, the script of the Hittite monuments, and the recently discovered linear writings of Crete (not to speak of the Cypriote characters), known to have been in existence in regions with which the Phœnicians were in contact earlier than the earliest monuments in Phœnician characters yet discovered. The argument of probability which led De Rougé to seek for the origin of the Phœnician alphabet in Egypt would seem, as a result more particularly of the discoveries of the Tel el-Amarna tablets, to point at present toward Babylonia. About 1400 B. C., as those tablets show, all the kings and rulers of Palestine and Syria, including the Phœnicians, made use, in their official correspondence at least, of the Babylonian cuneiform script and the Babylonian language. After this there is a blank, so far as our present knowledge is concerned, of some three or four centuries, during which we have no written records of any sort from this region. About the tenth century B. C., we find a fully developed alphabet in use among Phœnicians, Armæans, Moabites, and, presumably, all the kindred and neighboring peoples of Palestine and Syria, as well as in Greece, and each people writing its own language in this so-called Phœnician alphabet. In view of the kinship between the languages of Phœnicia and Babylonia, in view of the close connection between Babylonia and the western coast-lands of Asia, from a very early period, and especially in view of the use of the Babylonian script and language in those regions in the fourteenth century B. C., proved by the Tel el-Amarna tablets, it would seem not unnatural to suppose that the so-called Phœnician alphabet was developed out of Babylonian rather than Egyptian characters. This Mr. Ball endeavors to prove to have been the fact.

—He is not the first who has presented such a theory; but the increased knowledge of the old Babylonian characters, resulting from recent discoveries, enables him to make a better presentation of the theory than any of his predecessors. He presents a comparative table of the rival theories, the oldest known forms of Phœnician and Aramæan characters occupying the central column, with the Babylonian originals proposed by him to the left, and the Egyptian hieroglyphic or hieratic originals, suggested by De Rougé and his successors, on the right. Allowing for the tendency in all such lists to strengthen one's argument by an involuntary modification and assimilation of signs, it must be said that the old Babylonian characters chosen by Ball resemble much more closely the oldest forms of the Phœnician letters than do the Egyptian characters proposed by De Rougé and his followers. But still more important than the resemblance of forms is the resemblance in the names of the characters. It used to be assumed that the names of the Phœnician characters, as they have been handed down to us in Hebrew, are words, and that these words were the names of the letters in use among Phœnicians and Aramæans, as well as Hebrews. From Phœnician and Aramæan sources we have no names for the letters, while the Arabic and Ethiopic make use of an entirely different set of names, based, in the case of the Arabic, on the sounds of the letters only, and quite without significance. Some few of the letter names, as we now have them in the Hebrew, are, in fact, actual words, but by far the greater portion cannot be so explained, even by the most indiscriminate appeal to Aramaic and Arabic to help out our Hebrew. De Rougé's Egyptian theory offered no explanation whatever of these curious letter names. Ball explains them by derivation from the names of the Babylonian characters. He might have made his argument still more effective by a fuller comparison of the Greek names of the letters, which, while substantially identical as to the first syllable with the Hebrew names, were never developed, like the latter, into the similitude of words. He does, however, suggest this comparison. According to his theory, the original letter names were biliteral. For instance, the original of the Greek letter name *gamma* and the Hebrew letter name *gimel* was the syllable *gam*, or *gim*, or rather *g—m*, with an indeterminate vowel; Hebrew *beth*, Greek *beta*, is derived from the Babylonian *bat* or *bit*; *daleth* or *delta* from *da* or *dal*, etc. On the negative side Ball's table and his argument together are almost, if not quite, convincing against the Egyptian theory; on the positive side he certainly presents a very plausible case for the Babylonian origin of the alphabet. It must be remembered, however, that the Hittite inscriptions have not yet been satisfactorily deciphered, and that we do not know either the contents of those inscriptions or the affinities of the script in which they are written, while the recent discovery in Crete of tablets written in linear characters not related, apparently, to Babylonian cuneiform, Egyptian hieroglyphics, or Hittite, and antedating the earliest known inscriptions in the Phœnician alphabet, some account of which discovery appeared in the *Nation* of August 16, suggests new possibilities, and warns us to be cautious in our theories, in view of the extent of our present ignorance.

—Twenty years ago an organized attempt was made to grapple with the problem of rural education in France. A commission of inquiry was appointed by the Government, and, as one result of its report, chairs of agriculture were established in every Department for the purpose of training teachers—not to become agricultural experts, but to fit them for the duties of a village school by giving them practical instruction in agriculture and particularly horticulture. Six years after this, agricultural instruction was made obligatory in all primary schools. It is too soon to look for definite results from the new system, especially considering the two great obstacles of the ignorance and parsimony of the school boards, and the early age (eleven) at which all but a few children leave school. Many teachers, however, are doing excellent work, as is shown by a correspondent of the London *Times*. In the village of Olivet, for instance, in a school of 140 children, in addition to the theoretical lessons which all receive, the forty elder boys are taught, after school hours, budding, grafting, pruning, planting, etc. "All the trees and vines grafted by the pupils are their own property, and they may take them to their homes." Five times in the season visits are made to nurseries or farms, the walk being made the occasion for collecting plants and insects, or for a lesson in land-surveying. "Each child has a collection of dried plants, which are studied from various points of view and their beneficial or harmful properties explained. In the school museum to which the children contribute, there are 150 varieties of insects, classified either according to their good qualities or according to the injury they do to the vine, cereals, vegetables, fruit trees, forest trees, forage plants, and rose trees and flowers." Perhaps the most practical benefit arises from the fact that "almost every school has a good garden." These gardens, although the exclusive property of the teachers, are frequently used for demonstrations, and sometimes are cultivated by the children. It not infrequently happens that the school garden is the best in the village, thus demonstrating to the farmer, who knows nothing of science or theory, the value of intelligence in cultivating the ground. Great encouragement is given to the teachers of these rural schools by the prizes of money, medals, and books offered every year by the Government and the various agricultural societies.

—Negro civilization seems to have reached its highest stage at the present time among the Hausas of Nigeria, judging from the description by an English missionary of their principal town, Kano. A city of some 100,000 inhabitants, it lies foursquare, and is twelve or fourteen miles in circumference. A wall forty feet high and a moat eight feet broad surround it, the wall being enormously thick at the base, but tapering to a foot at the top. In it are thirteen gates, closed, at sunset, with massive wooden doors, well covered with strips of iron, against which are propped two huge beams, as there is neither lock nor key in Kano. Within the walls not a house was visible at first, nothing but field upon field of cultivated land upon which the people rely for food in the event of protracted siege. Through these the traveller passed for (apparently) two miles, when he came to broad thoroughfares lined with houses "splendidly made, although mud is the only material used there for building purposes," as timber is exceedingly scarce. These streets consist of two wide, level pathways with a vast hollow stretching between them from which the mud for building has been excavated. These hollows are generally cultivated; and as the houses stand in courtyards full of shade trees, the town has the appearance of a beautiful garden, the red mud standing out in striking contrast against the green foliage. Almost anything can be bought in the great market—"sugar, cotton cloth, leather, needles, crockery, tinware, dyes, lime, charcoal, meat, slaves, camels, horses, food of every variety, including tomatoes, wheat (which is grown near Kano), tamed gazelles, and hyenas, wild cats, birds—anything and everything." The money of the country is still the cowry shell, but the Maria Theresa dollar is taken, while gold and silver coins are eagerly bought to be worked up into ornaments. The King's palace was a "splendid specimen of mud architecture," and the audience-chamber a handsome room thirty feet square. The King was seated on a rich red dais, surrounded by his courtiers in compact rows, attired in magnificent costumes of green, red, and other hues. He proved to be determinedly opposed to the establishment of an English mission in his city, though with tactful treatment this antagonism to European civilization may eventually be overcome.

DRYDEN AS CRITIC.

Essays of John Dryden. Selected and edited by W. P. Ker, M.A., Fellow of All Souls' College, Hon. LL.D., Glasgow; Professor of English Literature in University College, London. Oxford: Clarendon Press; New York: Henry Frowde. 1900. 2 vols., pp. lxxviii, 324, 323.

Dryden's Dramatic Theory and Practice. By Margaret Sherwood. Yale University Dissertation. 1898. Pp. 103.

Just two hundred years have passed since the death of John Dryden, and now, for the first time, we have a critical edition of his literary essays, the only portion of his prose works that is of permanent interest. Mr. Ker has collected in two neat volumes those hastily written papers of which Swift said maliciously—

> "Read all the Prefaces of Dryden,
> For these our critics much confide in,
> Though merely writ at first for filling,
> To raise the volume's price a shilling"—

but in which later authors have been content to see the beginnings of modern English criticism.
